In any such theory, the assumptions made about the human mind are fundamental and decisive. If "the mind"—which for this most practical of purposes is the pupil's mind—is imagined as a sensitive plate merely, then teaching can take the simple form of making desired impressions on the plate by attending chiefly to the choice and form of those impressions. The rest is done by setting the child to take these in by rote, by repeating rules, by watching and remembering contrived experiments. In other words, the teacher points the camera and pushes the button for a snapshot or time exposure.

No pedagogy has ever been quite so simple, of course, for the least gifted or attentive teacher is aware that the child must exert *some* effort, be in some way active and not photographically passive, before he can learn the set verses or the multiplication table. So, to start the machinery, a system of rewards and punishments is established, which will by mechanical association strengthen the useful acts of mind or hand and discourage the useless or harmful. In this primitive pedagogy, the pupil's acquirements are deemed a resultant of essentially mechanical

forces, and the teacher serves as the manipulator of a wholly environmentalist scheme.

It is unlikely that any good teacher has ever adhered strictly to that role or thought of himself or herself as operating that sort of invisible keyboard. If it were so, no child would ever have learned much of value from any schooling whatever. But it is also true that educational practice always tends toward the crude mechanics just described. And the reasons are obvious: sheer incompetence in many teachers and weariness in the rest. For the two great limitations on classroom performance under any theory are (1) the scarcity of born teachers; and (2) the strenuousness of able and active teaching (which means that even the best teachers can sustain the effort for only a given number of hours at a time).

The state of affairs which James and other school reformers of the 1890s found and sought to remedy was a result of these several deficiencies. The movement of Western nations toward providing free, public, and compulsory education was, it must be remembered, an innovation of the nineteenth century. The inherent difficulties of this new social and cultural goal were great. It made unprecedented demands—on children, parents, administrative systems, and (most important) on the national resources of teaching talent, which are not expandable at will. Theory, too, was wanting for the supervision and teaching of teachers themselves. The confusion that ensued was therefore to be expected. Only a few points were clear: the older pedagogies were too mechanical in their view of the mind; the number of inadequate teachers was excessive; and the exploitive use of the good ones was a danger to the trying-out of mass education.

It was high time, therefore, that psychology put in its word on the subject it supposedly knew all about—the mind. Unfortunately, the mechanical view of the mind existed in two forms—one, as the view natural to ignorant or indifferent persons and, two, as the view that the prevailing scientific metaphor of the time seemed to justify. The universe, according to the Darwin-Spencer philosophy, was a vast machine, and its elements, living or dead, were also moved by the great push-pull of matter like the parts of a machine. The prophets of science—T. H. Huxley, John Tyndall, John Fiske—held audiences spellbound with illustrations of this principle, which everyone was sure could be demonstrated in the laboratory. The newest science, German born and bred, was psychophysics, a name which alone was enough

to show that the operations of the mind bore the universal character of mechanism. Man was no exception to the law exemplified by the collision of billiard balls or (in more refined form) by the effect of light on a photographic plate.

To be sure, these scientific interpreters of nature would not have subscribed to a simplistic pedagogy if they had ever turned the full force of their minds on the problem of teaching. One of them, Herbert Spencer, did write a fairly sensible tract on education. And the psychophysicists did not entirely blot out the influence of earlier and richer pedagogies, notably that of the German psychologist Johann Herbart, who died in 1841. But on the whole the situation of the schools in the decades of the nineteenth century was critical, and the strictures and exhortations of the reformers tell us very precisely in what ways.

James, with his encyclopedic knowledge of psychology, theoretical and experimental, his mastery of the art of teaching, and his genius for diagnosis in the study of human feeling, was in an ideal position for showing up the false principles, old and new, and propounding the true ones. The root of the matter was to consider the pupil as an active being—not merely a mind to be filled, but complex and growing organism, of which the mind was but one feature. That feature, in turn, was not a receptacle, but an agent with interests, drives, powers, resistances, and peculiarities which together defined a unique person. Nothing can be imagined farther removed from this than a machine built to a pattern and responding passively to external prods and prizes.

Rather, as one marks the difference, the familiar outline appears of the child who presides over the child-centered school of the Progressives—the men and women who came to dominate theory and practice thirty years after James. But it is only the outline of that child, for James was much too wise a philosopher to suppose that doing the opposite of whatever is done will correct present abuses. His *Talks to Teachers* (1899) fill but a small volume, yet they contain an extremely subtle and complex set of precepts—precepts, not commandments. To follow the precepts one must—alas—use intelligence and judgment, not because James is not clear and definite, but because the teaching situation is infinitely variable—like its object, the child.

To begin with, James does not reject the associationist principle that was the mainstay of the earlier

pedagogy. It is a sound principle, but it is not simple or automatic as was once thought. Associations impress the mind not in a one-to-one arrangement, but in groups or constellations, some members of which fight or inhibit each other. Moreover, the structure of the particular mind favors or excludes certain kinds and ranges of associations. It follows that to reach—and teach—any mind, the teacher must multiply the number of cues that will bring to full consciousness in the pupil the points he should retain or remember. The reason for this method, which is in fact less a method than a call to exert the imagination, is that the same reality can be cognized by any number of psychic states. It is accordingly a *field theory of thought* that James substitutes for the linear-mechanical and would have the teacher act upon.

Throughout his chapters, James moves back and forth from the schoolroom to the world, where the habits and powers of great minds and dull ones can be observed and turned into examples. The point of the shuttling is that there is or should be no difference in kind between what the child is asked to imagine, perform, remember, or reason out and what the grown man does or fails to do. This soon becomes an important criterion. Meanwhile the difference is in degree, which means that the teacher must be aware of differences in development—crudely measured by the age of the child, more closely measured by his rate of maturing, most delicately marked by what is called native ability.

Any teacher starts with the pupil as a lively bouncing creature in which the body and its needs predominate. The curiosity of the child is indeed a sign that mind is present also, but James knows that the “native interests of children lie altogether in the sphere of sensation” (1899, p. 92). Hence James recommends that until artificial interests develop, children be taught through objects, things that move, events of dramatic quality, anecdotes in place of propositions. Stressing also the link between instinct (which rules these early interests) and action, James strongly favors letting the child handle the means of instruction, build, take apart, try out, *do*.

In this commonsense view that instruction should begin by exploiting native interests (which turn out to be physical and active), James is a forerunner of the Chicago School, of which John Dewey was the instigator and later the idol. But neither James nor Dewey was an innovator in the desert. The European kindergarten movement, the early,

scattered elements of the Montessori method, and numerous other reforms of school and preschool instruction were in full swing even before James. Indeed, Rabelais and Rousseau had long since made the identical point about the value for education of having the naturally restless child learn by playing, both because playing is congenial and because it is the fundamental form of learning: trial and error.

That point evidently has to be made over and over again in history. But each time history gives it a special coloring. It was natural that in the period immediately after Darwin, which saw the popular triumph of science, the reminder about the child's activism should be seen as the root of the scientific march of mind; for if play is the germ of trial and error, trial and error is the germ of experimentation. It is this plausible linkage that set Dewey and the Progressives to pursue the scientific analogy to an extreme. For them—at least as educators—the mind is forever facing problems and seeking solutions. Teaching school therefore becomes the art of devising situations that will challenge the problem-solving mind and build up in its child-owner a stronger and stronger capacity to size up, ascertain, verify, and solve.

William James never had to confront this hypothesis head on, but it is clear what form his refutation would have taken. In the first place, not every adult is a scientist, and though it is true that adults who are not scientists encounter problems and resolve them, that activity is but one of many forms that cerebration takes. The poet, the painter, the mystic, the housewife, the salesman, the rabble-rouser, each performs his task differently, even if at times they all resort to “situation analysis” and “problem-solving.” We must remember James's assertion that the mind is continuous: it stretches from the kindergarten, where it learns, to the laboratory, where James studies it, just as it stretches from Plato's garden to the London Stock Exchange; which is to say that within the unity of the human mind reigns a great diversity, not reducible to the very special, historically late, and purposely artificial form of scientific reasoning.

According to James, good teaching, therefore, cannot follow a set form; it is not the curing of a weakness, such as the replacement of unreason by reason and superstition by science. Rather, it is the interaction of a practiced or well-filled mind with one on its way to the same state. The contents of any mind at any moment—that which James first called

“the stream of consciousness”—is an ever-flowing rush of objects, feelings, and impulsive tendencies. The art of teaching consists in helping to develop in the child the power to control this stream, to sort out its objects, classify their kinds, observe their relationships, and then multiply their significant associations.

In the abstract, this work may be called *attending*; the power generated is *Attention*. James is particularly valuable on this faculty. He points out that if passive attention is sustained by making subject matter continuously interesting, active attention will not develop. He knows that a good part of any subject for any learner of whatever age is bound to be dull; mastering it is drudgery. Therefore, while he encourages the teacher to arouse the pupil's interest in the dull parts of the work by associating them closely with the more interesting through showing unsuspected facets, by challenging pugnacity to overcome difficulty, by dwelling on the concrete effects of the abstract, and by any other means that ingenuity can supply, he does not lose sight of the goal. All this effort at building up enticing associations is to “lend to the subject . . . an interest sufficient to let loose the effort” of deliberate attention (1899, p. 110).

Not the precept alone but its pattern has significance. Throughout his educational doctrine, James is at pains to counteract what he calls the “softer pedagogy” by qualifying its blind zeal. The softer pedagogy is that which, having seized on a good teaching principle, such as “make the work interesting,” forgets that it is only a device and reduces the end of education to its means: What we can't make interesting we won't teach—or at least not require; there is a good reason for the pupil's not learning it: it's not interesting. On the contrary, says James, education that works for voluntary attention is “the education par excellence” (1890, p. 424).

The Jamesian correctives spring from a sense of the original *complexity* of the human mind. It is not a machine that mysteriously gets more *complicated*. Thus, when James recommends the use of objects, the indulgence of childish touching, building, and trying out, it is not in order to ingrain a habit of fiddling, but in order to develop mental powers that *transcend* the tangible and even the visual. Again, he refuses to give objects primacy over words or to deride the utility of abstraction: “. . . words . . . are the handiest mental elements we have. Not only are they very *rapidly* revivable, but they are revivable as

actual sensations more easily than any other items of our experience” (1890, p. 266). And he goes on to remark that the older men are and the more effective as thinkers, the less they depend on visualization. The implications for educational method, when we consider its evolution since 1890 and are aware that the abandonment of teaching to read has lately been urged on the strength of the visual substitutes at our disposal, deserve our closest attention.

The retreat from the word was already beginning in James’s time and he warned against its dangers. He bore incessant witness to the important connection between words and memory and its role in making knowledge secure. “I should say therefore, that constant exercise in verbal memorizing must still be an indispensable feature in all sound education. Nothing is more deplorable than that inarticulate and helpless sort of mind that is reminded by everything of some quotation, case, or anecdote, which it cannot now exactly recollect” (1899, pp. 131–132). The description seems to fit the student mind that does best at “objective” examinations, where the case or quotation is helpfully supplied. To summon it up unaided requires a more athletic type of mind, developed by training in verbal memory.

It is clear that James’s standard of performance, for both teacher and pupil, was quite simply *the best mind*. He was in that sense a thorough educational democrat, unwilling to classify and mark down intelligences ahead of time, on the basis of their background or their probable future. Everybody had a chance to rival the greatest; education was the means of finding out who could succeed, while helping all equally in the effort. This assumption and the attitude it dictates is the opposite of competing with oneself alone, setting one’s own standards, and pursuing only one’s own “needs”—which boil down to one’s own momentary wants.

All these limiting, hierarchical ideas were in the air when James wrote and lectured, and he put his finger on their unfortunate cause: “Our modern reformers . . . write too exclusively of the earliest years of the pupil. These lend themselves better to explicit treatment; . . . Yet away back in childhood we find the beginnings of purely intellectual curiosity, and the intelligence of abstract terms” (1899, p. 151). The implication here—and experience justifies it—is that the pupils are often brighter than their teachers: “Too many school children ‘see’ . . . ‘through’ the namby-pamby attempts of the softer pedagogy to lubricate things for them.”

The absurdity of believing that geography begins and ends with “the school-yard and neighboring hill” is a case in point. The child soon comes to think of all schooling as contemptible make-believe—and James with prophetic vision denounces the Dick-and-Jane reading books as yet unheard of: “School children can enjoy abstractions, provided they be of the proper order; and it is a poor compliment to their rational appetite to think that anecdotes about little Tommies and little Jennies are the only kind of things their minds can digest” (1899, pp. 151–152).

A principal cause of James’s impatience with spoon-feeding methods, with educational research and statistics (“those unreal experimental tests, those pedantic elementary measurements”), with theoretical advice, including his own (“a perceptive teacher . . . will be of much more value”), is his awareness of the deadly grip of habit (1899, p. 136). “Could the young but realize how soon they will become mere walking bundles of habits, they would give more heed to their conduct while in the plastic state” (1899, p. 77).

If this is true, how much more to blame are the teachers whose “method” in instruction becomes the mold of a habit imposed on the young mind. For James, a right education is precisely the power to sidestep ruts, to link ideas freely over a wide range, to exert voluntary attention, to be rich in suggestion and invention, and to be prompt in receptivity. He repeatedly contrasts the dry, prosaic mind with the witty and imaginative. And since knowledge and experience alike tell him that this balance of freedom and control which he disiderates depends on a well-furnished and strenuously trained mind, he wants teachers capable of arousing passion in their charges—the “whole mind working together.” Native deficiencies in this or that faculty can be overcome or ignored: “In almost any subject your passion for the subject will save you.” And at the same time he shows a warm understanding of the non-academic type. The student who cuts a poor figure in examinations may in the end do better than “the glib and ready reproducer,” just because of deeper passions and of “combining power less commonplace” (1899, pp. 137, 143).

It comes as no surprise, then, that James ends by defining education not in intellectual terms—though his whole impetus is toward intellect—but in terms that unite emotion and action: education is “the organization of acquired habits of conduct and tendencies to behavior. . . . To think is the

moral act:" it "is the secret of will, . . . it is the secret of memory . . . Thus are your pupils to be saved: first, by the stock of ideas with which you furnish them; second, by the amount of voluntary attention that they can exert in holding to the right ones . . . ; and, third, by the several habits of acting definitely on these latter to which they have been successfully trained" (1899, pp. 29, 186–188).

The "saving" is of course from the blind compulsion of determinism reinforced by bad habit. James's pronouncements about education rest upon a mass of physiological and psychological facts and are abundantly illustrated by reference to them. The reflex arc is as much a condition of learning as the stream of thought; the individual type of memory (visual, auditory, muscular) as determinative as the hereditary constitution of the neural synapses. But James is not a materialist, for he can find no evidence that these factors which limit or condition thought also produce it. And at the same time he finds in man's power of fixing the mind upon an idea—the power of thinking—a range of freedom to be exploited.

These considerations and conclusions bring us back to the starting point. If the nascent mind to be taught in the schoolroom is not a machine, if it is continuous and unified in kind, but diversified in quality and degree, if its operations are not exclusively analytic and directed at problem-solving, what sort of mind is it, in a single word? And what sort of educational theory will suit its needs? To answer the second question first, psychology can and ought to give the teacher help, but it is a great mistake to think that "the science of the mind's laws" can serve to define "programmes and schemes and methods of instruction for immediate schoolroom use. Psychology is a science, and teaching is an art; and sciences never generate arts directly out of themselves. An intermediary inventive mind must make the application, by using its originality" (1899, pp. 7–8).

In short, no matter which way we turn, we cannot in education get away from the work of the mind or substitute for it an ingenious abstraction. How then does the mind work? The scientific way, we saw, was but a special form of its activity; what is the inclusive mode, or as we just asked, what sort of mind? It is, so to put it, an artistic mind: it is by a kind of artistry that we perceive reality, which is the mind's most inclusive task. True, sensations hold a controlling position commanding our belief in what is real, but not all sensations are "deemed equally

real. The more practically important ones, the more permanent ones, and the more aesthetically apprehensible ones are selected from the mass, to be believed in most of all; the others are degraded to the position of mere signs and suggestions of these" (1890, p. 305). This description of the mind's seizing upon reality fairly parallels the operations of the artist upon his materials for the creation of another kind of reality: it is the pragmatic method, which only means human impulse seeking convenience and delight, seeking the permanent and the recognizable, the orderly and the satisfying. All education therefore aims at preparing the mind to fulfill its native tendencies and thereby to grasp and enjoy an enlarged order of multifarious reality.

## JEANES TEACHERS

African-American supervisors of teachers in the rural south from 1908 to 1968, Jeanes teachers (formally called Jeanes supervising industrial teachers) worked toward improving the communities of schools. They reported to the county school superintendent and the state agent for Negro education.

Jeanes teachers were mostly women and were paid in part from a fund established in 1907 by Anna T. Jeanes, a white Quaker woman who wanted to provide rudimentary education for African Americans who lived in rural areas. Additional funding came from the counties employing Jeanes teachers and the General Education Board (GEB), a private foundation created by John D. Rockefeller in 1902 to support southern education. From 1908 to 1926, Jeanes teachers received an average salary of \$45 per month for six to seven months of employment.

The portion of Jeanes teachers' salaries paid by their respective counties was based on the willingness and ability of county school board leaders to pay. County contributions varied, therefore, but until the mid-1920s were typically considerably lower than those provided by the Jeanes fund. Although some counties contributed to the traveling expenses of Jeanes teachers, others did not.

The economic situation affected county contributions as well as the teachers' workload. During the depression, for instance, the North Carolina State Board of Education made all Jeanes teachers work full time as teachers or principals, and perform their Jeanes tasks before and after school, on Saturdays and during vacations. Their salaries were paid in full by the Jeanes fund or other private donations.

### History

The first Jeanes teacher was Virginia Estelle Randolph of Henrico County, Virginia, who started to

work for the program in 1908. She was born in 1874 to former slaves. In 1890 Randolph passed the county teaching examination at the age of sixteen, beginning a fifty-nine-year teaching career. That Jeanes teachers were expected to be active not just in schools but in the community suited Randolph, who had always been active in her community. Prior to becoming the first Jeanes teacher, she organized a "Willing Workers Club" in Henrico County and a "Patrons Improvement League," composed mainly of women and aimed at improving sanitary and health conditions of homes and schools.

Impressed by Randolph's work, Jackson T. Davis, the superintendent for Negro education in Henrico County, applied for funding from the Jeanes Fund and convinced Randolph to become a Jeanes teacher. Not certain that she wanted to take on additional responsibilities such as supervising teachers in the entire county, Randolph prayed for guidance, then accepted the position. Her concern for the welfare of the entire community became the model for Jeanes teachers. Especially during the first two decades of the program, the trustees promoted Randolph's model by giving broad directions to Jeanes teachers and stressing the need to improve their communities.

By 1910, 129 Jeanes teachers worked in 130 counties in 13 southern states. In 1931 there were 329 teachers, but the figure had dropped to 303 in 1934 because of the states' financial difficulties during the Great Depression. By 1937 the figure had increased again to 426. In 1934 only 17 teachers were men, and 286 teachers were women, 177 of them married or widowed. The dominance of women was no coincidence. Dr. James Hardy Dillard, president of the Anna T. Jeanes Fund from 1908 to 1931, felt that women were better suited for the intensive work that required superb human-relations skills. The fund's administrators also argued that rural women, as opposed to urban, were best suited for the work, and women with a rural background dominated the Jeanes work during the program's first three decades.

### Goals and Duties

Jeanes Fund administrators stressed the need for the teachers to adapt to the specific needs of individual communities as well as to promote higher standards of living. Specific duties included school visits to help and encourage schoolteachers to teach sanitation, sewing, cooking, basket making, chair caning,

and mat making. Jeanes teachers were to meet with men and women in the communities to form Improvement Leagues or Betterment Associations. These organizations were to elevate living conditions and paint or whitewash schoolhouses, homes, and outhouses. The teachers also had to raise money to build better schoolhouses and lengthen school terms. Furthermore, they had to encourage and organize home and school gardens, tomato clubs, and corn clubs.

The first Jeanes teachers were considered industrial teachers but in 1918 at least two were trained nurses who taught good health and hygiene habits and how to care properly for children and sick people. The work of Jeanes teachers was often influenced by their gender. Women were expected to teach the “fundamental industries of the home.” Some women teachers taught sewing or cooking or both to other teachers, students and adults in the community. A few taught washing and ironing. Others were expert dressmakers, milliners, weavers and basket makers. The men, on the other hand, were expected to teach some “sort of bread-winning work.” They mainly taught farming and gardening but also carpentry, bricklaying, blacksmithing, shoemaking and repairing. Other male Jeanes teachers included a painter and paper-handler, a mattress-maker, a cook, and a tailor.

Most Jeanes teachers unofficially served as the county superintendent for African-American schools as white superintendents directed most of their energy toward schools for whites. Jeanes teachers encouraged mainly local African Americans and whites to give money and time to black education. They worked with principals and teachers in implementing curricula changes. They served as liaisons between black schools and white county and state school administrators. They also served as liaisons between black schools and state and local government agencies as well as federal agencies such as the U.S. Department of Agriculture.

To encourage African-American students to attend school, Jeanes teachers simultaneously addressed illiteracy and poverty throughout their communities. Jeanes teachers used Homemakers Clubs and other forms of industrial education to improve the rural food supply, health care, and their schools' finances. They raised funds to build and maintain Rosenwald and county training schools. Jeanes teachers participated in and provided leadership for numerous racial uplift organizations such as

the Federation of Afro-American Club Women, the National Association of Colored Women, the National Council for Negro Women, and church missionary associations. These organizations all provided avenues for community improvement, to support social welfare institutions such as orphanages and homes for wayward girls, and to set up and maintain recreational facilities. Providing clothing to destitute children and access to health care, along with the teachers' efforts to increase the number of schools and improve existing ones, stimulated attendance. The attendance rate increased by 22 percent between 1900 and 1920; by 1950, 69 percent of southern African-American children attended school.

### **The Homemakers Clubs**

The Homemakers Clubs were a major component of the Jeanes teachers' work and of industrial education for blacks in general during the early part of the twentieth century. They were community groups organized as early as 1913 by Jeanes teachers to instruct the locals mainly but not exclusively in the preservation of food. Homemakers Clubs were to encourage vegetable gardens, home sanitation, food preservation and sewing. The Jeanes teacher made personal visits to schools and homes and gave instruction in planting, cultivating, canning, and so forth. They placed special emphasis on the family garden.

### **Rosenwald Schools**

Jeanes teachers also encouraged people in their communities to become involved in building and maintaining schools. They used the contacts and goodwill they developed through Homemakers Clubs, churches and other organizations. Their success encouraged the GEB to increase funding for black schools. It helped efforts to attract funding for black education in the south from philanthropic organizations other than the Jeanes Fund, such as the the Julius Rosenwald Fund. Rosenwald, president of Sears, Roebuck and Company (1910 to 1924) and later chairman of the board (1925 to 1932), established the Rosenwald Fund for improving rural school buildings in the south through public-private partnerships. Jeanes teachers were directly involved in the construction of Rosenwald schools, and it probably challenged their fundraising, public-relations, and organizing skills more than anything else.

Rosenwald contracts stipulated that African-American communities match or exceed the amount

requested from the fund and demanded cooperation between state and county school authorities. The contracts also required that land, equipment and all other property be deeded to the county school. The Rosenwald program stressed industrial education. The first Rosenwald school was built in 1913 in Alabama. In 1936 the fund reported 5,357 schools built in fifteen southern states. North Carolina led the way. The Rosenwald Fund began its funding of schools there in 1915, and between 1915 and 1932 North Carolina built over 800 Rosenwald schools, far more than any other state.

Jeanes teachers worked with local and state officials, professionals such as attorneys and doctors, as well as religious and nonreligious organizations, both black and white, to promote the construction of these schools. They raised funds for equipment, including kitchen equipment. By July 1, 1932, Rosenwald contributions to school construction in the south was \$4.3 million. African Americans had contributed \$4.7 million, and local governments, \$18.8 million. Rosenwald funding increased dramatically during the last four years of the program as it built larger, six-room to seven-room schools.

State agents were important to African-American education, but Jeanes teachers facilitated their success and played the most significant role in the Rosenwald building program. Of the more than 4,000 Rosenwald schools built by the mid-1930s in all fifteen southern states, two-thirds were in counties where Jeanes teachers were employed. Although overlooked by historians, the efforts of Jeanes teachers and other women made the most significant difference in the number and quality of schools for rural African Americans.

### Health Care

In addition to providing buildings to facilitate access to education, Jeanes teachers addressed other student needs. During the first three decades of the twentieth century, hookworm disease, tuberculosis, syphilis, and to some extent malaria and pellagra wreaked havoc on southern communities. Most counties could not afford a nurse, and few health institutions existed for African Americans or the poor. As early as 1917 Jeanes teachers were selected by health departments to help combat tuberculosis. Jeanes teachers invited city nurses to talk to parent-teacher associations and organized medical examinations for students. They held preschool clinics during which nurses or doctors checked students'

tonsils, and visited homes in advance to make sure parents brought their children. Jeanes teachers organized "Clean Tooth" campaigns and National Health Week activities. They fumigated school buildings, following the county health officer's instructions.

### Contribution

Heavy workloads and high expectations from both the community and the Jeanes teachers themselves often meant that most worked long hours, even though they were not paid for much of their overtime. Some teachers visited three to four schools a week, others five to eight. Teachers sometimes spent a week at a particular school, overseeing industrial training projects, assisting teachers with reading, writing, spelling, and arithmetic instruction, visiting homes, and organizing clubs for home and school improvement.

The sheer size of their mandate and the fact that they had to develop most programs from scratch meant that Jeanes teachers could not fulfill all expectations. Jeanes teachers were allowed considerable freedom and flexibility to decide priorities based on their assessment of a community's need and the resources available. It also allowed them to manipulate a Jim Crow system to provide African Americans with some opportunities and most importantly, hope.

## JEWISH EDUCATION, UNITED STATES

---

Throughout history, the Jewish people have been a minority culture and religion. In times of peace, Judaism thrived; in times of hostility, Jews protected themselves from outside forces. In the United States today, Jews face relatively little hostility. Jews are allowed to live wherever they please, they can study and engage in any profession, and they may practice their religion openly. Fighting anti-Semitism is no longer the rallying cry that it once was for the Jewish community. The state of Israel, another center of Jewish cohesiveness, now stands strong in the Middle East and American Jews no longer worry about Israel's permanence as a nation. Furthermore, most Jewish people in the world today are free to leave their countries and move to Israel. Jews cannot rally around the cries to free Soviet Jewry as they did in the late 1980s. Those Ethiopian Jews who dreamt of immigration to Israel are already being resettled. While small pockets of Jews still live in countries that do not allow them to leave, the vast majority of Jews around the world are free.

The multitude of issues that propelled Jewish communities in the United States to come together—and drew individual Jews to work together for the good of the Jewish people worldwide—no longer have the urgency that they once did. Jews in the United States can live without Judaism; many immerse themselves in their secular lives without feeling the loss of the richness of their Jewish heritage. Many Jewish parents are failing to pass their Jewish religion and heritage to their children. In fact, less than half of all children born to at least one Jewish parent (or a parent who was born Jewish) are being raised as Jews, according to Alice Goldstein and Sylvia Fishman's 1993 study. Furthermore, the rate of intermarriage is at an all time high. Almost 50 percent of American Jews married since 1985 did not marry within the Jewish faith. Thus, the overriding concern for American Jewry in the twenty-first century is Jewish continuity—the continued existence of the Jewish people, its culture, traditions, practices and beliefs.

There are three main denominations in the U.S. Jewish community: the Orthodox, who strictly follow the traditions of Jewish life and the basic code of Jewish law; the Conservative, who embrace the central rituals and laws of Judaism but adapt them to modern life; and the Reform, who preserve the

spirit of the law, with the letter of the law as a guidepost for modern decision-making. Across all denominations and movements of Judaism, the response to threats of total assimilation and continuity is education. Jewish education is an important tool as community leaders look to ways to ensure the survival of Judaism for generations to come. Jonathan Sarna maintained in 1998 that “Jewish education serves as the vehicle through which we train successive generations of Jews to negotiate their own way as Jews, in the American arena” (p. 10). This mission is achieved through numerous educational frameworks: day schools, afternoon religious schools, Sunday schools, informal educational programs, university-based programs, and extensive adult education.

### Jewish Day Schools

Day schools are private, independent schools that teach Jewish and secular education subjects, similar to other parochial schools in the United States. The Jewish subject matter typically focuses on Hebrew language, prayers, the Bible, customs, ceremonies and rituals, Jewish history, and the state of Israel. Most day schools are not affiliated with any particular congregation or synagogue, although most are connected to one of the three main denominations of Judaism.

Reform and Conservative Jews have long been ardent supporters of public education. Public schools have typically been seen as a place where children of different backgrounds could mix with—and learn about—each other in a safe environment. Jews have often been at the forefront of efforts to oppose educational options that would lead to segregated schools. Furthermore, many Jews have long felt that Jewish day schools are outdated and not appropriate for Jewish children brought up in the modern world. For instance, in 1870, Rabbi Isaac Mayer Wise, a prominent Reform Jewish leader declared, “Education of the young is the duty of the State and that religious instruction . . . is the duty of religious bodies. Neither ought to interfere with the other” (quoted in Sarna, p. 11).

In contrast, for Orthodox Jews, day schools—including yeshivas—where Torah and other religious subjects are the primary curricula, continue to be the sole avenue for educating children. Most Orthodox day schools belong to an umbrella organization called Torah Umesorah that provides curricula, teacher training, placement services, and special ed-

education supports to the Orthodox educational community. Some Orthodox day schools continue to use Yiddish as the language of instruction, while most day schools rely heavily upon Hebrew.

At the end of the twentieth century, day school enrollment—including that of non-Orthodox day schools—increased dramatically. A census of Jewish Day Schools in the United States conducted by Marvin Schick in 2000 calculated that 185,000 students were enrolled in Jewish day schools across the United States. About two-thirds of these students were in either New York or New Jersey, which strongly correlates to the large percentage of Orthodox Jews who live in these states. In fact, Orthodox schools accounted for 80 percent of the total enrollment in Jewish day schools during the 1998 to 1999 school year.

In all day schools, enrollment is higher in the younger grades. For Orthodox schools, this is true because of increased—and high—birthrates in their communities. In non-Orthodox day schools many parents believe that better opportunities exist in public or other private, non-Jewish schools for their older children when college admissions becomes a key decision factor. Furthermore, many communities do not have non-Orthodox Jewish high school options.

For Reform and Conservative Jews, day schools are seen as a solution to the multitude of Jewish youth growing up without knowledge or commitment to Judaism or a Jewish identity. Seen as a response to the Jewish continuity crisis, new day schools are cropping up across America. Goldstein and Fishman's 1993 research indicates that youth who receive Jewish day school education are less likely to intermarry and are more likely to raise their children as Jews.

### **Synagogue Education**

While attendance at Jewish day schools increased markedly in the ten years prior to the beginning of the twenty-first century, most non-Orthodox Jewish children still receive the majority of their Jewish education in supplemental religious schools run by local synagogues. This mode of education allowed parents to avoid the fears of “ghettoization” of the day schools. Synagogue religious schools have long been given the task of educating Jewish youth in a wide range of subjects, including history, culture, holidays, Hebrew language, prayer, and Torah. Students

in some congregations attend supplementary religious school one day per week, called Sunday school. Other students, especially those affiliated with the Conservative movement, attend approximately six hours per week, one and one-half hours on two days after “regular” school and three hours on Sunday morning. Much of the focus of supplementary school education is on preparing youth for the bar or bat mitzvah at the age of thirteen. Hence, enrollment often declines after bar/bat mitzvah age.

Attendance at synagogue religious school is the central mechanism for children to learn about Judaism. Because of the part-time nature of these educational programs, numerous challenges confront these schools. One is the obvious lack of time and sustained focus available to educators. Children attend with low levels of motivation and commitment after a long day in their secular school. An even bigger challenge is the personnel crisis in Jewish education. These supplementary school classes are often taught by teachers who, although committed Jews, know little about the subjects they teach. A study of Jewish educators in three communities in the United States found that close to 80 percent of the teachers in supplementary schools have neither a degree in Jewish studies nor certification as Jewish educators. In preschools, 10 percent of the teachers are not even Jewish. In one community the figure was as high as 21 percent according to the Council for Initiatives in Jewish Education. Professional development opportunities are relatively scant as well.

However, a new generation of supplemental religious schools is emerging to refocus on both the personnel and continuity crises. Educational efforts are geared toward learners of all ages, including families. Teachers are participating in expanded educational opportunities. Synagogue communities are recognizing that if supplemental education is to be successful it will have to (1) span all age groups and (2) allow students to enter a “Jewish existence that they will recognize to be existentially, intellectually, and spiritually meaningful” (Pekarsyky, p. 39). Successful supplementary schools tend to be housed in synagogues where the educational programs are a high priority for the congregation as a whole, have favored status and commitment from all stakeholders (especially the rabbis and lay leadership), and are linked to the culture and mission of the synagogue.

### Informal Education

One of the most important developments in Jewish education is the huge increase in participation in Jewish summer camps, youth groups, organized youth trips to Israel, and family and adult education. Summer camps are places where Jewish youth can interact with one another in uniquely Jewish environments. Camps allow participants to see the value of living as more than cultural Jews. Campers are able to gain respect and appreciation for engaging in daily Jewish ritual. They experience the power of group observance, and gain their own Jewish identity, independent of that of their parents.

Jewish youth groups are also instrumental in giving Jewish children the education they need to be committed Jews. Like camps, youth groups have many purposes beyond that of education. Social, athletic, and community service activities often attract Jewish youth who may not have attended Jewish day schools, supplemental religious schools, or camps. Thus, participation in Jewish youth groups is an important mechanism to reach out to all types of youth, particularly the unaffiliated. Youth groups are often housed in Jewish community centers and other cross-denominational frameworks.

Summer youth trips to Israel are a large part of the "curriculum" of Jewish education. It was estimated by the Commission of Jewish Education in North America in 1990 that approximately 25,000 American youth annually participate in educational trips to Israel. Some supplementary religious schools mandate participation in a class trip to Israel. Many Jewish federations, a community umbrella organization for all Jewish organizations in a city, provide scholarships to make it possible for youth to go to Israel on educational trips. The educational value of trips to Israel is well documented. Those youth who experience Israel firsthand are more committed ideologically to the state of Israel and to Judaism.

Informal adult education programs provide numerous opportunities for Jewish study. Small groups of adults meet together in informal text study groups, attend retreats, and participate in noncredit courses offered by Jewish community centers, local Hebrew colleges and synagogues. Family education is considered one of the newest models of Jewish education. Young and old alike come together as families to focus on Jewish learning, holiday workshops, and cultural events.

### Conclusion

The end of the twentieth century saw a revival of interest in Jewish education. Day schools increased in popularity across all denominations. Synagogues refocused on providing quality, meaningful education to both children and adults either in a religious school setting or through adult and family education. Informal educational opportunities for youth expanded. Although it is true that, in part, this is due to the traditional Jewish emphasis on education, the increased financial support by Jewish federations and individual philanthropists was aimed at attacking trends of intermarriage, assimilation, and Jewish continuity. Formal and informal Jewish education is the rallying cry.

## JOHNS HOPKINS UNIVERSITY

Johns Hopkins University was founded in 1876 by educational pioneers who abandoned the traditional roles of the American college and forged a new era of modern research universities by focusing on the expansion of knowledge, graduate education, and support of faculty research.

### Early Years

In 1873 Johns Hopkins, a childless bachelor, bequeathed \$7 million to fund a hospital and university in Baltimore, Maryland. At that time this fortune, generated primarily from the Baltimore and Ohio Railroad, was the largest philanthropic gift in the history of the United States. Flush with funds, the new board searched the nation for appropriate models of higher education. Finding none to their liking, they opted for an entirely new model. It was to be a truly national school dedicated to the discovery of knowledge. It owed its inspiration not to America's higher educational system but to modernized Germany. By following the Germanic university example, the board animated a new spirit and structure, which moved higher education in the United States away from a focus on either revealed or applied knowledge to a concentration on the scientific discovery of new knowledge. This made Johns Hopkins the genesis of the modern research university.

### The Gilman Period

Johns Hopkins was intended to be national in scope, so it could serve as a balm for a country divided over the sectional strife of the Civil War. As such, the university's official commemoration took on great significance: 1876 was the nation's centennial year and February 22 was George Washington's birthday. Notwithstanding the care taken in selecting this date, the institution's viability depended directly on the board's choice for the first president. They chose wisely. Daniel Coit Gilman, lured away from the presidency of the University of California, helped create Johns Hopkins University and lead American higher education in new directions. In word and sometimes deed, Gilman held to some traditional goals of the denominational college but, nevertheless, he created the first American campus focused on the faculty and their research. To Gilman, Johns Hopkins existed not for the sake of God, the state, the community, the board, the parents, or even the students, but for knowledge. Therefore, faculty who expanded knowledge were rewarded.

Connected with the new university's focus was its concentration on graduate education and the fusion of advanced scholarship with such professional schools as medicine and engineering. It was the national pacesetter in doctoral programs and was the host for numerous scholarly journals and associations. Having a faculty-oriented perspective, the university did not want its professors bogged down in remedial education, but rather wanted to attract serious, prepared students who could genuinely participate in the discovery of new knowledge. Though the opposite is often mistakenly believed, Johns Hopkins has always provided undergraduate education, although Gilman had to be persuaded to include it and other early presidents attempted to eliminate the program. However, whether undergraduate or graduate, Johns Hopkins concentrates on providing research opportunities for all of its students. And its strong ties with John Hopkins Hospital, a teaching and research hospital, attract students from around the nation interested in biomedical engineering and medicine.

### Modern Times

The legacy of adroit leadership begun by Gilman has continued. Among the many able presidents, Milton S. Eisenhower, brother of Dwight Eisenhower, led Johns Hopkins during the 1950s and 1960s when the university's income tripled, endowment doubled,

ambitious building projects were undertaken, and strong ties with Washington, DC, were developed. Because of his contributions, Eisenhower was one of two men named president emeritus. Steven Muller, who served as president from 1972 until 1990, is the only other one awarded this title—and along with Gilman is one of two to be named president of both the Johns Hopkins hospital and the university.

Though privately endowed, Johns Hopkins University embodies what Clark Kerr called the “federal grant university,” as it often tops the nation in federal research and development expenditures. Johns Hopkins University also illustrates the skewed priorities of federal grants, as the school’s humanities programs cannot hope to attract research funding commensurate with that attracted by medicine, public health, engineering, and physics. Despite this imbalance, the institution remains committed to professional instruction in conjunction with academic disciplines within a true university setting. The Georgian-style Homewood campus provides an academic atmosphere that allows students to participate in extracurricular activities. In intercollegiate athletics, Johns Hopkins is famous for lacrosse and houses the National Lacrosse Hall of Fame and Museum, a fitting location because the Blue Jays have won thirty-seven national championships. At the same time, its medical school and hospital remain in their historic setting in downtown Baltimore’s harbor area. The university’s educational presence in Baltimore is supplemented by its economic role as the city’s single largest employer. Clearly, the Johns Hopkins University continues to fulfill its mission as a national university and as an academic pioneer.

## JOHNSON, MARIETTA PIERCE (1864–1938)

Founder of the School of Organic Education in Fairhope, Alabama, Johnson won international recognition as a child-centered Progressive educator. She was born near St. Paul, Minnesota, and grew up as a twin in a close-knit farming family. After attending public schools in St. Paul and graduating from the state normal school at St. Cloud in 1885, she taught in rural elementary and secondary schools, and served as a training teacher in normal schools. Johnson found success and popularity as a traditional instructor, priding herself on how quickly she could teach first graders to read.

### Organic Education

After a decade and a half of classroom work, she suddenly rejected the very methods she practiced and demonstrated so impressively. In 1901, with all the force of a religious conversion experience, Johnson was convinced that her well-intended but misguided teaching methods violated the “order of development of the nervous system. I realized that my enthusiasm was destructive, and the more efficient I was, the more I injured the pupils!” (Johnson 1974, p. 8). The catalyst for this change was a personal reading program that led Johnson from child psychology books into works by Jean Jacques Rousseau, Friedrich Froebel, and John Dewey. Through these readings as well as her own observation, she came to see that children move through distinct stages as they grow and that parents and teachers should key their educational efforts to the developmental process.

Johnson’s belief in social reform made her unusually receptive to ideas on educational reform. She and her husband John Franklin were socialists, and in 1902 they moved to the small Gulf Coast village of Fairhope, a utopian community dedicated to the single-tax philosophy of Henry George, author of

*Progress and Poverty* (1879). At home among former Midwesterners and northeasterners who seemed determined to set an example for the rest of the world, Johnson added an educational dimension to the Fairhope experiment.

Johnson immediately began searching for ways to educate each student as a complete organism—a “whole child,” as Progressive educators would soon have it—paying balanced attention to body, mind, and spirit. The School of Organic Education she founded in 1907 became known as the most child-centered progressive school in the nation. Dewey explained in *Schools of To-Morrow* (1915) that he was one of many students and experts who had made pilgrimages to this remote corner of the Deep South to see Johnson’s experiment. Dewey pronounced it a “decided success,” and his rave review helped catapult Johnson into national prominence. Soon the School of Organic Education was attracting talented teachers and well-to-do boarding students from throughout the country.

Johnson’s approach to education was genuinely radical. The once eager teacher now steered students away from books until the age of nine. Younger children, she maintained, were not ready for print. They could learn more through direct experience with the environment. Dewey and other visitors to the school were impressed with the time spent teaching and learning outdoors or in the shop, which Johnson regarded as the “most important place on our campus.” Every student did daily handwork in the shop, while students and teachers joined in daily folk dancing. Students did no homework and took no tests until high school; nor did they receive grades or report cards. Such features drew most of the attention so that observers tended to overlook the curriculum, which became more demanding and rigorous as students gained maturity.

Refusing to compare one student to another, Johnson rejected “external, competitive” standards in favor of the “inner, human” standard of simply doing one’s best. To critics who charged that the school was a “do-as-you-please” school—a common caricature of child-centered Progressive education—she countered that “children have no basis for judgment [and] do not know what is good for them” (Johnson 1974, p. 95). Teachers and parents, she insisted, were responsible for taking charge and directing young people away from “unwholesome” activities.

Such tough talk notwithstanding, Johnson was anything but authoritarian. She relied instead on personal appeal—a quiet but powerful presence—to convince people to do things her way. She was a charismatic woman who projected self-confidence. She shared some of these qualities with other women founders of early-twentieth-century progressive schools, most of which were elite private institutions. In an era when males imposed a business-oriented, measurement-driven version of progressivism on public schools, a few women opened private schools as child-centered alternatives. But Johnson was less autocratic than most of her peers, and her school also differed in significant ways.

Part of an experimental community, Organic operated as a quasi-public institution that charged local children no tuition. During Johnson’s lifetime, one-half to two-thirds of Fairhope’s white families chose to send their children to her school, which she hoped would become a model for reforming public education. She worked to create a climate of equal opportunity for females, accommodated disabled students, but reluctantly yielded to community pressure to bar African Americans.

Despite support from local tax revenue, Johnson fought an uphill battle to keep the Organic School solvent, a situation that forced her into a parallel career as a fundraiser. She spent much of her time on the lecture circuit, speaking throughout the United States and in several other countries, recruiting boarding students whose tuition and fees subsidized the attendance of local students. She was especially popular in the New York City area, where a group of socially prominent women organized the Fairhope Educational Foundation to support her efforts, particularly her work as director of the Edgewood School in Greenwich, Connecticut. A cofounder of the Progressive Education Association in 1919, Johnson tried with limited success to use the organization to promote organic education nationwide. Her efforts did inspire the founding of several private child-centered progressive schools, including the Peninsula School in Menlo Park, California, and a school in Rose Valley, Pennsylvania.

### **New Trends in Education**

While the Great Depression of the 1930s wreaked financial havoc on an already unstable Organic School, Johnson’s name lost some of its magic within the Progressive education movement, now dominated by social reconstructionists who dismissed her

as a “play schooler” despite her longstanding commitment to social reform. Disappointed that few public educators had accepted organic education, she died in poor health in 1938. Without Johnson, the Organic School has drifted far from its educational moorings at times, but unlike many such schools, it continues to offer, in the early twenty-first century, a version of its founder’s original vision.

## JOURNALISM EDUCATION ASSOCIATION

When the Journalism Education Association (JEA) celebrated its seventy-fifth anniversary in 1999, it noted that the organization’s name and location had changed several times, but the goals are still very similar to those of its founders—to support secondary school journalism teachers and media advisers.

According to its mission, JEA supports free and responsible scholastic journalism by providing resources and educational opportunities, by promoting professionalism, by encouraging and rewarding student excellence and teacher achievement, and by fostering an atmosphere that encompasses diversity yet builds unity.

In 1924 a group of teachers attending the Central Interscholastic Press Association in Madison agreed unanimously to start a national association for high school journalism teachers. The group did not settle on a name and goals until 1929 when it became the National Association of High School Teachers of Journalism (NAHSTJ). Other name changes occurred in 1930 to National Association of Journalism Advisers (NAJA), in 1935 to National Association of Journalism Directors (NAJD), and in 1939 it became a department of the National Education Association with an advisory council. After World War II the group pushed for increased membership and by late 1949 had 800 members.

The current name, Journalism Education Association, was created in November 1963. At that time, a forward-looking curriculum commission chair, Sr. Ann Christine Heintz, oversaw the publication of several booklets for teachers, including ones that went beyond JEA’s previous focus on newspapers and yearbooks to include broadcast media, classroom teaching methods, and publication trends. In 1966 the journal *Communication: Journalism Education Today* (C:JET) was established, evolving into a quarterly publication about mass media in secondary schools. When two JEA members participated in the Robert F. Kennedy Commission of Inquiry into High School Journalism, the organization embraced a new concern. The commission’s findings, which included the pervasive presence of censorship in high school media, sparked JEA’s increased support of free student expression.

With a membership topping 2,000 in 1999, JEA is the only independent national scholastic journalism organization for teachers and advisers. A volunteer organization, its elected board consists of current or retired journalism teachers. In addition to its president, vice president, secretary, and immediate past president, who acts as parliamentarian and convention coordinator, the board has regional directors and commission chairs. These commissions represent the areas of interest and concern for JEA and, as of 2002, were Scholastic Press Rights, Certification, Multicultural, Development/Curriculum,

and Junior High/Middle School. A national headquarters at Kansas State University serves as a clearinghouse for programs and activities, maintains the JEA Bookstore and membership records, and is the office of JEA's executive director.

To achieve its mission, JEA hosts two conventions per year with the National Scholastic Press Association. These spring and fall meetings offer on-site contests, break-out sessions, media tours, hands-on training, and keynote speeches from media professionals. By 2002 attendance at these four-day conventions often topped 5,000.

Other activities include a voluntary certification program; awards, including High School Journalist of the Year, Future Journalism Teacher, and High School Yearbook Adviser of the Year; Adviser Institute summer training; an Internet site; and a member listserv, JEAHELP, which offers immediate connection and support between members.

CANDACE PERKINS BOWEN

## JOURNALISM, TEACHING OF

Journalism in American secondary schools began at approximately the same time journalism programs appeared in colleges. The first known high school journalism class was in Salina, Kansas, in 1912. But student newspapers are not always tied to a class, so not surprisingly they appeared long before this date. The first recorded one, *The Student Gazette*, was handwritten by the students of William Penn Charter School in Philadelphia in June 1777. The first known printed school paper, *The Literary Journal*, was published at Boston Latin School on May 9, 1829.

The growth of journalism as part of the high school curriculum became significant in the 1920s. By the mid-1920s a number of state and national organizations had been founded to support secondary school journalism teachers and publications advisers. During the ensuing half century, substantial interest grew in such organizations as the Columbia

Scholastic Press Association, headquartered at Columbia University; the Quill and Scroll Society, an honorary organization of high school journalists at the University of Iowa; the National Scholastic Press Association, based at the University of Minnesota; and the Journalism Education Association, the only organization solely for teachers, which had several names and locations but in 1987 settled at Kansas State University.

Teachers indicate that support from such organizations is vital because a majority of journalism teachers have little specific media training and because keeping current in such a quickly changing field is difficult. Certification or licensing to teach journalism is not required at all in roughly half the states, and many others have only minimal formal academic demands, according to Marilyn Weaver of Ball State University, who conducted a 1993 survey reported in *Death By a Cheeseburger* (1994). By the end of the twentieth century, some states, such as Ohio and Oregon, offered licenses in Integrated Language Arts, which include journalism but require virtually no course work in it. The number one field of licensure among journalism teachers and advisers is English (80%). Journalism is next (26.2%), followed by social studies and speech or drama, according to respondents to a 1998 national survey reported by Jack Dvorak.

Because state requirements vary so greatly, voluntary "certification" became an option in 1990 when the Journalism Education Association launched its Certified Journalism Educator/Master Journalism Educator program. Although it is not designed to replace state licensure where it does exist, the JEA's program offers teachers a variety of ways to earn these designations and indicate their knowledge of the field, including combinations of course work, years in the classroom, tests, and projects. By 1998, 500 teachers had been named CJEs, and by 1999, 100 were MJEs.

### Curriculum and Teaching Standards

Teachers tap into state and national organizations to get help with curriculum, which changed significantly in the late twentieth century. Journalism programs range from those that offer English credit and allow students a variety of choices—from Journalistic Writing to Newspaper Production to Photojournalism—to those with only a yearbook staff meeting after school. However, a 1998 national study of the status of journalism in the nation's high schools re-

vealed that nearly 97 percent of them have at least one media-related activity—a journalism course for credit, a yearbook, a newspaper, a newsmagazine, or a television or radio station. More than 77 percent of the journalism educators who participated in the survey reported that at least one journalism class was offered at the school. About 90 percent of the schools offered a media laboratory for student journalists who work on newspaper, yearbook, or broadcast facilities. Projected onto the high school population in the United States, these percentages mean that about 453,576 students were enrolled in a course called “Journalism,” and nearly half a million students served on school media staffs in the late 1990s, as estimated by Dvorak’s research.

Course objectives and curriculum vary widely, but by the 1980s, teachers groups worked to emphasize the academic respectability of journalism. Some administrators who grew up in an era when high school publications were filled with jokes and puzzles question the educational value of the course. To combat this, the Dow Jones Newspaper Fund launched a project that offered workshops on various university campuses to train teachers for Intensive Journalistic Writing courses at their schools. The high school students in the classes they taught then took the College Board’s Advanced Placement English Language and Composition Examinations. Results since then have shown a higher percentage of journalism students than Advanced Placement English students passing the examination. This result motivated a group of JEA officers and college journalism educators to ask the College Board to create a course and corresponding test for Advanced Placement Journalism. By 2002 the College Board had surveyed educators at both the high school and college levels and was considering this.

**Standards.** National standards for journalism became a concern in the 1990s. Since so many programs are part of the English curriculum, a group of educators sought to show the parallels between the two disciplines. *Standards for the English Language Arts*, published in 1996 by the International Reading Association and the National Council of Teachers of English, established twelve standards for all language arts courses “to ensure that all students are knowledgeable and proficient users of language.” By 2002, *NCTE Standards in Practice as They Apply to Journalism* presented a series of lesson plans and vignettes to illustrate the way media and media-related projects also help teachers meet these standards.

In 2001 a committee of high school and college educators began developing national standards for journalism teacher education. Basing its work on newly created standards from Indiana, Michigan, and Kansas, the group prefaced its national standards with the following: “Educators who teach secondary school journalism must have a broad range of knowledge and performance abilities. Although their courses are frequently placed in a school’s English Department, their teaching responsibilities go beyond what most English or language arts curriculum requires. Therefore, these standards reflect their need to be skilled in teaching writing, listening, speaking, leadership skills, cooperative processes, press law and ethics, and media design and production. The combination of these helps them prepare their students as knowledgeable media producers and consumers who are essential to our democracy.”

An increasing amount of support for high school journalism came from the professional press in the late 1990s. Such groups as the Dow Jones Newspaper Fund and the Newspaper Association of America, which had sponsored programs for more than twenty years, were joined by the American Society of Newspaper Editors, which funded university training for more than 200 teachers each summer, and the Radio and Television News Directors Foundation, seeking to help advisers of all electronic media forms.

### Digital and Electronic Media in the Curriculum

The media that students study and produce shifted dramatically with the growth of digital technology in the 1990s, and teachers found the changes challenging. Instead of typing articles and pasting them on large sheets of paper as their predecessors did, students began using computers. First this was just for word processing, but soon research tools included e-mail for communication and the Internet for information gathering. Meanwhile, production switched to desktop publishing with specialized software and graphics programs, scanners, and digital cameras. By the beginning of the twenty-first century, students at a growing number of schools were creating online publications with timely updates of breaking news, reader response capabilities, and even video and audio clips of local events. Some student staffs collaborated with schools across town, across the country, or around the world to write related articles and share photos from events that would interest a wide teen audience.

In the 1990s many schools across the country found ways to acquire free broadcast equipment, so launching television stations became an option, as well. While some students merely delivered morning announcements, others hosted talk shows and created in-depth video packages for weekly viewing on area cable channels. Student-managed electronic media nearly doubled between 1991 and 1998.

### Law and Ethics

A final area of concern for journalism educators has been law and ethics. In 1974 the Robert F. Kennedy Commission produced *Captive Voices: The Report of the Commission of Inquiry into High School Journalism*. Among the findings of the 22-member commission was the extent of censorship in high school media: "(S)tudent rights are routinely denied, with little or no protest of the students." One result of the Commission was the formation of the Student Press Law Center in Washington, D.C. The SPLC is an advocate for student free-press rights and provides information, advice, and legal assistance at no charge to students and the educators who work with them. More than 2,000 of them contact the SPLC each year to get advice and support in producing media that allows free student expression and teaches journalism students the rights and responsibilities they have in a democracy.

Concern that student journalists were not learning about the First Amendment and how to apply it in their programs led a coalition of media organizations to launch the Let Freedom Ring Award in 2000. The Journalism Education Association, National Scholastic Press Association, Columbia Scholastic Press Association, Quill and Scroll, and the Freedom Forum's First Amendment Center developed a program to recognize and applaud schools that support all parts of the First Amendment in their student publications and their teaching.

## HISTORY OF JUVENILE COURTS

The juvenile court and its philosophy of treating minors who violate the criminal law differently than adults is barely a century old. Historically, juvenile criminals were treated the same as adult criminals.

### The Law Prior to the Creation of the Juvenile Court

Punishment was the central criminal law philosophy in English common law. A conclusive presumption that children under seven could not form criminal intent eliminated the youngest from the criminal justice system. Children between the ages of seven

and fourteen were presumed incompetent to form the requisite criminal intent; the prosecutor, however, could rebut that presumption by demonstrating that the child knew the difference between right and wrong. Children over age fourteen were presumed to have the capacity to form criminal intent. There were no special courts for children, and they were treated as adult criminals. Minors were arrested, held in custody, and tried and sentenced by a court that had discretion to order the child imprisoned in the same jail as adult criminals. Although children received the same punishment as adults, they were not provided with many of the due process protections accorded adult criminals. For instance, minors did not have a right to “bail, indictment by grand jury, [and] right to a public trial” (Conward, p. 41).

Although the early American colonies adopted the English common laws regarding child criminals, from 1825 until 1899 several reform movements initiated significant changes both in philosophy and in treatment of juvenile delinquents. Quaker reformers spurred the New York Legislature in 1824 to pass legislation creating a House of Refuge, which separated poor children and juvenile delinquents from adult criminals. The goal of the House of Refuge movement was both to prevent predelinquents from becoming criminals and to reform those who had already committed crimes. The judge had discretion to determine which juvenile delinquents might properly benefit from the House of Refuge; child criminals unlikely to reform were maintained in adult prisons.

### The First Juvenile Court

Progressive reformers in Illinois persuaded the legislature to pass the 1899 Illinois Juvenile Court Act creating America’s first juvenile court. The act adopted the early English common law *parens patriae* philosophy in providing that “the care, custody and discipline of a child shall approximate as nearly as may be that which should be given by its parents.” Several unique features characterized the early juvenile court. First, because reformation was the goal, the system focused more on the individual child rather than on the nature of the criminal offense. Second, because the time within which reformation could be accomplished varied with the child, indeterminate sentences often exceeded the determinate sentences that adult criminals received for committing the identical criminal act. Third, juvenile delinquents were separated from adult criminals be-

cause they were different in kind. Adult criminals were morally blameworthy; children were merely the products of their environment and therefore retributive punishment was not warranted. Fourth, because juvenile court proceedings were not criminal, children were not entitled to the full panoply of due process protections accorded adult criminals. Informality permitted the court to consider all facts relevant to determining the child’s reformation plan. Petitions replaced criminal complaints, summons replaced warrants, custody replaced arrest, detention replaced confinement, initial hearings replaced arraignments, and delinquency replaced conviction. Fifth, juvenile courts had broad discretion to fashion innovative rehabilitation programs not always available in adult courts, such as release upon informal voluntary probation conditions. Sixth, technical evidentiary rules were inapplicable in juvenile court because they impeded the judge from determining all facts necessary to determine the individualized treatment necessary to rehabilitate the minor.

Although the goals of the juvenile court were laudable, many historians have bemoaned the system’s realities. In 1970 the harshest critic, Sanford Fox, termed the reformers’ legislation “a colossal failure” (p. 1224). It became apparent that the informal procedures and almost unbridled discretion of juvenile court judges often supplied minors with less-fair procedures and treatment than adults received. In a famous 1839 Pennsylvania case, *Ex parte Crouse*, the court expressed the general view of American courts that because the goal of juvenile justice is rehabilitation, not punishment, the due process protections afforded adult criminals need not be provided to juveniles: “The House of Refuge is not a prison, but a school. Where reformation, and not punishment is the end” the formalities of the criminal court are not required. In addition, the juvenile court’s goal of individualized treatment often lacked objective criteria and conflicted with notions of justice. By the 1960s critics spoke of the demise of the juvenile court, and they “raised questions about the effect on juveniles of the lack of due process procedures and protection of individual rights” (Sarri, p. 5).

### *In re Gault* and the Constitution

The assault on the reform movement began with a 1966 case in the U.S. Supreme Court, *Kent v. United States*, which held that under a District of Columbia statute the informal process of determining whether

a juvenile should be tried in juvenile or in adult court failed to provide sufficient due process protection for children. The Court held that before a minor is transferred to adult court the child is entitled to an informal hearing where the trial court must articulate the reasons for the transfer so that the child can have an adequate record for appellate review. Additionally, in response to the state's position that juvenile cases were civil, not criminal, the Court responded, "There is evidence, in fact, that there may be grounds for concern that the child receives the worst of both worlds; that he gets neither the protections accorded to adults nor the solicitous care and regenerative treatment postulated for children." The Court thereby rejected the reform movement's justification for informality in juvenile delinquency cases. And a year later in *In re Gault*, the Court set the due process boundaries between adult criminal procedure and juvenile delinquency trials. First, the Court rejected the reformers' claims that the juvenile justice system accurately and fairly determined children's criminal responsibility: "Under our Constitution, the condition of being a boy does not justify a kangaroo court." Second, although *Gault* rejected the argument that the Fourteenth Amendment due process clause requires identical due process procedures for adults and juveniles, the Court determined that juveniles must at least receive alternative equivalents. Thus, in a juvenile delinquency trial, children are entitled to: (1) notice of the charges, (2) a right to counsel, (3) a right to confrontation and cross-examination, and (4) a privilege against self-incrimination. The U.S. Supreme Court quickly followed the *Kent* and *Gault* cases with the 1970 case *In re Winship*, which held that juvenile delinquency requires the "beyond a reasonable doubt" adult standard of proof, and the 1971 case *McKiever v. Pennsylvania*, which held that juveniles charged with a criminal law violation are not entitled to a jury trial because the Sixth Amendment right to jury trial applies only to criminal actions and because juries would substantially eviscerate the beneficial aspects of the juvenile court's "prospect of an intimate, informal protective proceeding."

The U.S. Supreme Court's juvenile delinquency due process cases ushered in a period of reform in state juvenile court systems that lasted almost a decade. In 1974 the President's Commission on Law Enforcement and Administration of Justice was established to study the deficiencies in the juvenile delinquency system. The commission urged more

nonjudicial service agency intervention for predelinquents and recommended limitations on the confinement of minors.

### Increased and More Serious Juvenile Crime

From the mid-1980s to the early 1990s the national juvenile crime rate rose dramatically; "property crime by juveniles increased 11 percent nationally between 1983 and 1992, [and] violent crime increased by 57 percent" (Feld, pp. 976-977). During this same period, media coverage of juvenile crime dramatically increased. Even though the frequency and content of news coverage often exaggerated the rise in youth crime, the coverage had an enormous impact on the public's call for more protection for citizens and for harsher treatment of juveniles committing serious criminal acts. In reality, during the decade 1987-1997 only 6 percent of American juveniles were arrested and fewer than 0.5 percent were arrested for violent crimes. Nevertheless, state legislatures quickly responded to the public's fear of rising juvenile crime rates by substantially modifying the juvenile court process.

All fifty states modified their juvenile law codes to provide that, under certain circumstances, juveniles could be tried as adults in criminal court. These procedures fall into three distinct types: (1) judicial discretion to transfer a minor from juvenile court to adult court; (2) prosecutorial discretion to decide in which court the child will be tried; and (3) legislative mandates requiring juveniles who commit certain offenses to be tried in adult court. A second statutory change lowered the age at which children were eligible to be transferred to adult court. According to Elizabeth S. Scott, writing in 2000, "Between 1992 and 1995, eleven states lowered the age for transfer; twenty-four states added crimes to automatic/legislative waiver statutes, and ten states added crimes to judicial waiver statutes" (p. 585, fn. 145). A third major juvenile law modification was the development of blended sentences, which involve lengthy juvenile law confinements coupled with the transfer of the juvenile upon reaching the age of majority to serve the remainder of the sentence in adult prison. Finally, juvenile courts have opened their proceedings to the public in cases that involve certain specified serious crimes, and legislatures have substantially reduced minors' right to seal juvenile delinquency court records.

Both liberal and conservative experts and organizations have called for the elimination of the juve-

nile court either because it is a too lenient response to the perception of increasing serious juvenile crime or because it unfairly treats poor and minority children. It is uncertain whether the public's clamor for change will be quelled by the reduction in juvenile crime that began in the mid-1990s.

WILLIAM WESLEY PATTON

#### CONTEMPORARY JUVENILE JUSTICE SYSTEM AND JUVENILE DETENTION ALTERNATIVES

The juvenile justice system under English common law and early American colonial law did not differentiate between legally competent minors and adults regarding criminal sanctions. Juveniles aged seven or older who had sufficient criminal capacity were tried in adult courts and sentenced to adult institutions. In the United States from about 1825 until 1899 a reform movement ushered in dramatic changes in the philosophy toward juveniles in the criminal law system. Children were seen not as sinners but rather as immature, malleable, and developing individuals who were very different from adults. Rather than applying the retributive justice of the adult criminal system, the reformers argued that children should be educated and nurtured so that they could become productive members of society rather than being housed with adult criminals who would further mold them into hardened recidivists. By 1899 a separate juvenile court was established in Chicago. The reformers argued that in order for a judge to properly determine the specialized care necessary for each juvenile who came before the court, the formal due process structure of the criminal court must be abandoned so that judges could assess all relevant data.

By the middle of the twentieth century it became clear that the good intentions of the reformers had never materialized and that children in the juvenile court were receiving neither the specialized care nor the due process necessary for the public to have confidence in juvenile court determinations. From the mid-1960s through the mid-1970s the U.S. Su-

preme Court on several occasions held that the informal structures of the nineteenth century juvenile court denied juveniles due process of law under the Fourteenth Amendment of the U.S. Constitution. Except for the right to a jury trial and bail, the Court held that juveniles were entitled to a panoply of due process protections, including the right to timely notice of the charges, confrontation, and cross-examination; proof beyond a reasonable doubt; and the privilege against self-incrimination.

During the 1980s the public perceived an escalation in juvenile crime, and a new reform movement developed that aimed to make the juvenile justice system more responsive to public safety and to assure personal responsibility by juvenile delinquents. States experimented with mandatory juvenile sentences, mandatory transfer of serious juvenile offenders to adult criminal court, modification of confidentiality of juvenile records, active participation by victims, mandatory victim restitution, and new correctional alternatives for dangerous juvenile offenders.

Experts have identified a juvenile justice cycle that has continued to revolve since the nineteenth century. The initial cycle starts when the public perceives a dramatic increase in juvenile crime and that the juvenile justice system is providing too lenient dispositions and too little public protection. The system responds with harsher treatment of juvenile delinquents and a reduction in informal resolution processes. Then, according to a 2000 article by Sacha M. Coupet, "following a period of extreme harshness and largely punitive policies, when the level of juvenile crime remains exceptionally high, 'justice officials . . . are forced to choose [once again] between harshly punishing juvenile offenders and doing nothing at all'" (p. 1329). From 1990 to the early twenty-first century, the American public has viewed juvenile crimes as constantly escalating in number and severity. By the early twenty-first century, U.S. society was at that point in the cycle where retributive justice had substantially overtaken the nineteenth century reformers' notions of rehabilitation and individualized treatment of juvenile delinquents.

### The Reality of Juvenile Crime Statistics

There is a substantial disconnect between the public's perceptions of juvenile crime and the reality of juvenile crime statistics. Although juvenile crime is still a major social problem, contrary to the impres-

sion portrayed by the media regarding the explosion in youth crime, the juvenile crime rate began decreasing in 1995. In 1999 juveniles comprised only 17 percent of all arrests and 12 percent of all violent crime arrests. In 1999 the juvenile murder arrest rate fell 68 percent, to the lowest level since the 1960s, and juvenile arrests for violent crime dropped 23 percent from 1995 to 1999.

Many have argued that the most significant factor in the public's misinformation is the distortion of juvenile crime by the news media. A comprehensive examination of crime in the news conducted by Lori Dorfman and Vincent Schiraldi in 2001 found that: (1) the press reported juvenile crime out of proportion to its actual occurrence; (2) violent crime, although representing only 22 to 24 percent of juvenile crime from 1988 to 1997, dominated the media's coverage of juvenile offenses; (3) the media presented crimes without an adequate contextual base for understanding why the crime occurred; (4) press coverage unduly connected race and crime; and (5) juveniles were rarely covered by the news other than to report on their violent criminal acts.

Significant changes in the demographics of juvenile crime occurred between 1988 and 1998. Not only did the number of juvenile delinquency court cases increase, but also many changes in the age, sex, and race of delinquents altered the landscape of juvenile offenders. In 1988 the juvenile courts processed 1.2 million cases; by 1997 the total had increased to 1.8 million. According to a November 2001 fact sheet issued by the U.S. Department of Justice's Office of Juvenile Justice and Delinquency Prevention, a study of California delinquency cases found that "a small percentage (8%) of the juveniles were arrested repeatedly . . . and were responsible for 55 percent of repeat cases." The most important types of cases and trends during the period from 1988 to 1998 included violent juvenile crime, juvenile property offenses, juvenile drug offenses, and juvenile gangs.

**Violent juvenile crime.** In 1988, 24 percent of juvenile court cases involved crimes of violence against a person. Of those violent crimes, 20 percent were committed by females and 62 percent by children under age sixteen. White children represented 56 percent of violent delinquents while African-American children represented 40 percent. In 1998, by contrast, 23 percent of the juvenile court caseload involved crimes of violence, females committed 28 percent of the violent crimes, children under age six-

teen accounted for 64 percent, and 62 percent were committed by white youth and 35 percent by African-American children. Thus the juvenile population of violent offenders in 1998 was comprised of more females, more white children, and younger juveniles than in 1988. The percentage of violent crimes among children, however, remained relatively constant. The dispositions for juvenile offenses also changed during that same period. In 1989, 33 percent of juveniles found in court to have committed a violent crime were placed outside the home, compared to 27 percent in 1998. Also, in 1989, 54 percent were placed on probation, compared to 58 percent in 1998. During the period between 1988 and 1997, the number of adjudicated cases resulting in out-of-home placement increased more for African-American children (60%) than for white children (52%).

**Juvenile property offenses.** From 1988 through 1994 the juvenile arrest rate for property offenses was relatively stable. Between 1994 and 1999, however, the juvenile arrest rate for property offenses dropped 30 percent to the lowest level since the 1960s. The disposition of sustained property offense petitions in 1988 resulted in out-of-home placement in 28 percent of juvenile cases; by 1997, however, the rate had dropped to 26 percent. In addition, in 1988 property offenses comprised 52 percent of all juvenile court out-of-home dispositions, but that number dropped to 42 percent in 1997, reflecting a softening juvenile court attitude toward property offenses in relation to other juvenile crimes.

**Juvenile drug offenses.** Several dramatic shifts in the numbers and demographics of juveniles arrested for drug offenses occurred between 1988 and 1999. Drug abuse violation arrests were relatively constant from the 1980s until 1993. From 1993 and 1998, however, the number of drug offenses more than doubled. In 1994 drug offenses comprised 8 percent of all delinquency cases, and in 1998 the rate increased to 11 percent. Although the number of formally processed juvenile drug cases increased by more than 50 percent from 1994 until 1998, the percentage of out-of-home placements for drug offenses decreased from 36 percent in 1989 to 23 percent in 1998. This decline has been credited to an inadequate number of out-of-home placements and/or to a shift in juvenile court attitude regarding the seriousness of drug offenses in relation to violent person offenses. The age of juveniles arrested for drug cases remained relatively constant. In 1989

children age fourteen and younger comprised 18 percent of arrested juveniles compared with 19 percent in 1998. There was a dramatic shift, however, in the race of arrested juveniles. In 1989 whites represented 58 percent of those arrested for drug offenses and African Americans comprised 40 percent. In 1998 whites represented 68 percent and African Americans only 29 percent of all juvenile drug cases. Finally, the percentage of drug arrests for girls increased from 14 percent in 1989 to 16 percent in 1998. The drug arrest rate for both sexes was twice the average of the rate in the 1980s.

**Juvenile gangs.** Juvenile gang crime was a significant social issue during the last quarter of the twentieth century. The number of cities reporting youth gang activity rose from 300 in the 1970s to nearly 2,500 in 1998. In the 1970s only nineteen states reported gang problems, but in the 1990s all fifty states reported gang crimes. In 1999 there were approximately 26,000 gangs and 840,500 gang members in the United States. Compared to the figures for 1998, these numbers represented a decrease in gangs of 9 percent and an increase in gang members of 8 percent. Also, the average age of gang members increased; gang members aged fifteen to seventeen decreased 8 percent from 1996 to 1999. In addition, the number of girl youth gang members increased greatly from the 1970s through the 1990s. It is estimated that in the 1970s girls comprised only 10 percent of juvenile gangs; in the 1990s, however, girls made up between 8 and 38 percent of many gangs. Female youth gang members are arrested most frequently for drug offenses, and arrests for prostitution increased from 0.8 percent in 1993 to 9.8 percent in 1996. Youth gangs continue to be a major problem that the juvenile justice system has not yet begun to control.

### **An Increasing Emphasis on Juvenile Crime Prevention**

Even though the 1990s and early twenty-first century have ushered in a new era of retributive juvenile justice, federal government policies still emphasize a juvenile crime prevention model formally established in 1974 when the president and the U.S. Congress created the Office of Juvenile Justice and Delinquency Prevention (OJJDP) as part of the U.S. Department of Justice's Office of Justice Programs. The goal of the OJJDP, according to its 2000 annual report, is "to provide national leadership in addressing the issues of preventing and controlling delinquency

and improving the juvenile justice system.” The OJJDP operates a host of juvenile delinquency crime prevention programs and research in the following areas: gangs, girls, mental health, safe schools, state coordination, drug education, juvenile mentoring, national youth network, violence in the media, truancy reduction, very young offenders, child development, gun violence, children’s advocacy centers, and Internet crimes.

A unique and very controversial juvenile crime prevention policy of the latter part of the 1990s and the early twenty-first century is a partnership between police departments and public schools to identify, treat, and punish juvenile delinquents. This partnership is the result of four different intersecting juvenile problems. The first is the nexus between truancy and juvenile delinquency, drug abuse, gang activity, and adult crime and poverty. According to a 2001 bulletin by Myriam L. Baker, Jane Nady Simon, and M. Elaine Nugent, “adults who were frequently truant as teenagers are much more likely than those who were not to have poorer health and mental health, lower paying jobs, an increased chance of living in poverty, more reliance on welfare support, children who exhibit problem behaviors, and an increased likelihood of incarceration” (p. 1). Research conducted in 2000 determined that 60 percent of juvenile crime occurs between 8 A.M. and 3 P.M. when children should be in school. The most common truancy delinquency prevention programs include a sharing of data between schools and police and prosecutors, holding parents criminally responsible for their children’s truancy, assessing parents fines, and requiring parents to attend parent training classes.

A second partnership between public schools and law enforcement was spurred by a few high-profile multiple-victim homicides involving teenagers that occurred between 1993 and 1998. Because of the media attention on these very few high-profile school violence cases, parents pressured school districts to develop serious school violence prevention programs. In reality, according to a 2001 article by Margaret Small and Kellie Dressler Tetrick, “school-associated violent deaths are rare . . . less than 1 percent of the more than 1,350 children who were murdered in the first half of the 1998–99 school year . . . were killed at school” (p. 4). Public schools responded, in part, by using law enforcement as references in designing preventative and emergency re-

sponse programs and in monitoring and investigating suspicious student activity.

Third, after empirical studies demonstrated that the adult criminal conviction rate of children who bullied other children in school was almost twice as high as the rate for those children who did not engage in bullying, public schools began focusing on less-violent aggressive student behavior. A 2000 study by the National Institute of Child Health and Human Development found that 1.6 million children in grades six through ten were bullied at least once a week. Many schools have instituted “zero tolerance” programs that expel students after one sustained finding of bullying. These children are also often referred to law enforcement for consideration of juvenile justice intervention.

Finally, because research has demonstrated a correlation between abused children and high rates of juvenile delinquency, schools and law enforcement have partnered in establishing programs that identify, treat, and prosecute child abusers. All states mandate that teachers report suspected child abuse to either law enforcement or to children’s services workers.

### **Modern Juvenile Law Disposition Alternatives**

Because rehabilitation is no longer the central goal of the juvenile justice system, new forms of placement have developed to assure community safety and juvenile responsibility to victims. Traditional juvenile delinquency dispositions involved individualized indeterminate terms based upon the needs of the child for rehabilitation. During the 1990s the model shifted to a determinate sentence length based not on the child’s needs but rather on the seriousness and frequency of criminal law violations, with a goal of deterrence and retribution. Further, the trend in the early twenty-first century is to shift sentencing discretion in cases of violent crime from the juvenile court judge to the legislature. In 1997 Congress enacted the Innovative Local Law Enforcement and Community Policing Program, requiring those states that accept federal funds to create accountability-based dispositions that balance the interests of the community, victim, and offender. Therefore, juveniles whose delinquency hearings are litigated in juvenile court usually face one of the following disposition alternatives. If the child committed a minor offense and does not have a prior delinquency record, it is likely that the juvenile trial judge can grant a form of probation termed a “home of parent cus-

tody” order in which the child agrees to abide by relevant probation conditions; a violation of a probation condition, however, can lead to institutionalization. In 1998, 665,500 children were under probation supervision, an increase of 56 percent since 1989. Some juveniles are released home upon the condition that they wear electronic monitoring equipment, which limits the child’s freedom without the necessity of formal incarceration. If the crime charged is minor, but the juvenile has a prior delinquency record, the judge usually has discretion to order the child detained out of home in an institutional setting until the child reaches the age of majority in that jurisdiction. If the minor commits a serious offense, a modern trend is developing for the legislature to create a mandatory minimum sentence that may also involve a “blended sentence” in which the juvenile upon reaching the age of majority is transferred to an adult institution to serve the remainder of the mandatory minimum sentence. Prior to the blended sentence movement, juvenile courts did not have discretion to hold children accountable beyond the age of majority.

Because many juveniles are being transferred to adult courts, the adult correctional systems have responded with a new variety of sentencing schemes. The total number of juvenile delinquency cases transferred to adult criminal court peaked in 1994, and the number of children tried in adult courts increased 33 percent in 1998. In 2000 approximately 14,500 children were incarcerated in adult facilities; 9,100 were housed in adult jails and 5,400 in adult prisons. There was a 366 percent increase in the number of juveniles confined in adult jails from 1983 to 1998. Juveniles are more likely to be violently victimized and five times as likely to be sexually assaulted if they are placed in an adult rather than a juvenile facility. There are fewer sentencing alternatives in adult court than in juvenile court. In “straight adult incarceration” jurisdictions, juveniles are sentenced like adults with little or no differentiation in the terms of the confinement. In “graduated incarceration” models, juveniles receive adult sentences, but they are housed in juvenile or separate wings in an adult institution and are transferred to the adult wing upon reaching a defined age. In “segregated incarceration” models, juveniles are sentenced as adults but are housed in special young offender units that have many of the rehabilitative services available to delinquents in juvenile correctional facilities.

In order to reduce cost and recidivism, some states are experimenting with community-based programs in which the child’s family can participate in necessary therapy to cure or control the conditions that led to the child’s delinquency. Another innovation involves community-based aftercare programs that provide juveniles released from secure confinement facilities intensive supervision upon release. Ironically, these aftercare programs are based upon the rehabilitation model rejected by the contemporary retributive juvenile delinquency model. In exchange for intensive monitoring by a probation officer, mandatory drug testing, and the imposition of a curfew, the juvenile receives individualized analyses of the conditions that initially led to delinquency, including assessments of the juvenile’s relationships with family, peers, and the community. The goal is to reduce recidivism by mixing intensive services and surveillance. Whether this new juvenile model of “punishment first/rehabilitation second” will be effective is yet to be determined.

WILLIAM WESLEY PATTON

## JUVENILE CRIME AND VIOLENCE

Juvenile crime is a perennial public concern, although public perceptions of juvenile crime are often shaped by misconceptions and unwarranted fears rather than by objective facts. For example, in 1996 the cover of a national magazine (*Newsweek*, March 10) made the alarming claim that “Juvenile violence is soaring—and it’s going to get worse.” In contrast, a 1999 federal report by Howard Snyder and Melissa Sickmund cited national arrest statistics and other data showing that violent juvenile crime peaked in 1993 and began a steady decline. From 1995 to 1999, juvenile arrests for violent crime declined 23 percent, and homicides declined an astonishing 56 percent, despite an 8 percent increase in the population of juveniles. The murder rate for juveniles in 1999 was the lowest since 1966. Yet in 1999, public anxiety over a series of school shootings skyrocketed when two teenage boys murdered twelve classmates and a teacher at Columbine High School in Colorado.

The Surgeon General’s Report on Youth Violence, released by the U.S. Department of Health and Human Services in 2000, identified numerous public myths about youth violence. Among these misconceptions were: (1) the belief that the United States was threatened by a new, violent breed of young super-predators; (2) nothing works in treating or preventing juvenile violence; and (3) juvenile crime could be curbed by prosecuting juvenile offenders as adults. In fact, there was no evidence that young offenders in 2000 were more vicious or callous than previous generations, only that the availability of cheaper, more lethal firearms resulted in more homicides. Further, controlled scientific studies found that well-run prevention and intervention programs do reduce violent behavior and criminal recidivism among the young. And finally, studies found no crime reduction associated with transferring juveniles to adult court; in contrast, youths tried as adults were more likely to be physically and sexually victimized in adult institutions, and were more likely to commit additional offenses upon release to the community.

## Scope and Prevalence of Juvenile Crime

Juvenile crime traditionally refers to criminal acts committed by persons under age eighteen. If one includes status offenses, such as consuming alcohol, smoking, being truant from school, running away, and violating curfews, that are crimes only because the person committing them is underage, then the majority of youth in the United States might at some point be classified as delinquent offenders! Nonstatus offenses are much less common. According to Snyder and Sickmund’s 1999 report only about 5 percent of juveniles are ever arrested, and more than 90 percent of the arrests are for nonviolent crimes. Of course, arrest statistics undercount the true numbers of offenses, since an unknown number of offenses committed by juveniles go undetected. Self-report studies generally reveal higher prevalence rates; for example, among high school seniors, the annual prevalence of committing an assault with injury to the victim was 10 to 15 percent and the prevalence of robbery with a weapon was 5 percent.

Juveniles account for only about 16 percent of serious violent crimes, but nearly one-third (32%) of property crimes, according to FBI arrest statistics from the Uniform Crime Reports. Juveniles are involved in the majority (54%) of arson arrests and disproportionate numbers of vandalism (42%), motor vehicle theft (35%), and burglary (33%) arrests. Of the 2.5 million juvenile arrests in 1999, the most frequent charges were larceny-theft, simple assaults, drug abuse violations, curfew and loitering, disorderly conduct, and liquor law violations. Arrest statistics are difficult to interpret, because they do not correspond directly with the number of youth arrested or the number of crimes committed; several youths might be arrested for the same crime, a single youth might be arrested multiple times in the same year, or a youth might be arrested once, but charged with multiple offenses. Nevertheless, comparisons of adult and juvenile offenders, again as summarized by Snyder and Sickmund, indicate that juveniles are generally not predisposed to crime, and although they commit a disproportionate number of minor crimes, they are much less likely than adults, especially young adults, to commit serious violent crimes.

## Crime in Schools

Highly publicized episodes of gun violence at schools raised national concern that schools were not safe environments. Homicides at school, though

tragic, are fortunately quite rare. In a 2001 report, the National School Safety Center concluded that less than one percent of all juvenile homicides occur in school, and that the number of homicide deaths in schools declined from forty-two in the 1993–1994 school year to eleven in 1999–2000.

Schools are not crime-free sanctuaries, however, and crime rates in schools correlate with the crime rate of the surrounding community. A 1998 study by the National Center for Education Statistics found that approximately 21 percent of high schools, 19 percent of middle schools, and 4 percent of elementary schools experienced at least one serious violent crime (primarily aggravated assaults) per year, including crimes committed by nonstudents. Nevertheless, most juvenile crime takes place in the hours immediately after school, when students are less likely to be supervised.

Property crimes are three times more prevalent than violent crimes at school (including travel to and from school). According to the National Center for Education Statistics's 1998 report on school crime and safety, approximately 12 percent of students reported thefts of their personal property in a six-month period, whereas only 4 percent reported violent crimes, defined as physical attacks or robbery with threat of violence. The annual rate of serious violent crimes (sexual assault, robbery, and aggravated assault) at school is less than half the rate away from school.

According to noted Norwegian researcher Dan Olweus, as well as reports by the U.S. National School Safety Center, bullying is increasingly recognized as a serious and pervasive problem in schools, although it is often overlooked or disregarded by parents and teachers. Common bullying behaviors, such as pushing and shoving, verbal harassment, and threats of violence, would be regarded as crimes if they took place in an adult workplace, but often go undetected or unpunished in schools. Studies indicate that most students have been bullied at some time and that bullying is most common in the middle school grades, where more than 10 percent of students may be victims of chronic bullying.

### Juvenile Offenders

There is no single profile or adequate characterization of the diverse group of youth who come to be identified as juvenile offenders. Most youths who commit crimes as juveniles desist in early adulthood,

and most who come to juvenile court never return on a new referral. However, a small group of juveniles is prone to continued offending. Marvin Wolfgang's classic 1972 study of a Philadelphia birth cohort of 10,000 boys found that about 6 percent of the boys were responsible for more than fifty percent of the crimes committed by the entire sample. Subsequent studies, summarized by Snyder and Sickmund in 1995, found that 5 to 16 percent of all referrals to juvenile court are youths with five or more arrests, and these youths account for 50 to 80 percent of all juvenile offenses.

Why do youth commit acts of violence and other crimes? Theories abound, but there is general agreement that there are multiple developmental pathways associated with different contributory factors. Youth whose onset of problem behavior begins before puberty commit more frequent and more violent crimes in adolescence, and are more likely to persist in violent offending in adulthood, than youth with later onset.

**Family factors.** Many factors increase the risk that a juvenile will engage in criminal or violent behavior, but no single factor is necessary or sufficient. For example, poverty and single parent family status are widely recognized risk factors, but most poor children raised by single parents in low-income homes do not become criminals. Global factors such as poverty and parent marital status are too broad to specify the precise problems in the child's family environment. A single mother working long hours for low wages may not be able to provide supervision for her children, she may be under too much stress to maintain a warm, supportive relationship with her children, and she may be inconsistent in disciplining them. In contrast, there are many examples of poor, single parents who nevertheless manage to provide excellent care for their children. Risk factors might be buffered by protective factors such as a mentoring relationship, religious convictions, special talents, or strong motivation to achieve.

More intensive studies reveal patterns of inconsistent or inappropriate parental discipline, as well as poor monitoring and supervision, in families of children who develop conduct problems. In one common pattern, parents fail to respond to their child's misbehavior, or when they do respond, it is often with excessive force or harsh emotion. Such parents tend to threaten, hit, grab, or yell to coerce children into compliance. Not surprisingly, their children then respond similarly (e.g. yelling, stomp-

ing, or hitting) when parents try to limit their behavior. The parents intermittently overlook or acquiesce to their children's misbehavior, thereby reinforcing it and rendering it even more resistive to discipline. Other important family risk factors include child abuse, exposure to domestic violence, and parental substance abuse.

**Social factors.** Parental influences diminish markedly in adolescence and are often superceded by peer influences. Youths who associate with delinquent peers adopt more antisocial attitudes and engage in more delinquent behavior. Youths who are unpopular with conventional peers are especially likely to seek friendships with less conventional, more antisocial youths.

As youths spend increasing amounts of time unsupervised outside the home, they become more vulnerable to the negative influence of communities characterized by a high level of social disorganization—high residential turnover, high unemployment and few job opportunities, frequent crime, drug trafficking, gang activities, and a relative lack of recreational opportunities. Youths who feel endangered in the community are more likely to carry weapons and seek protection from gang affiliation, which ironically increases the risk of involvement in violent or criminal activities. Access to handguns is particularly problematic and was linked to a three-fold increase in juvenile homicide arrests from 1984 to 1993.

Adolescents are highly influenced by the entertainment industry. As noted by the 2001 Surgeon General's Report and many other authorities, more than forty years of research demonstrates that even brief exposure to film violence causes short-term increases in aggressive behavior, including physical aggression, in youth. Longitudinal studies show small but consistent correlations between childhood television viewing and young adult aggression, even after controlling for other factors such as socioeconomic status and parental discipline. The impact of violent music and video games has not been extensively studied, but early studies show similar effects. Advocates for the entertainment industry point out that many other factors influence the development of aggressive behavior, and that the link to serious violent crime is less clear.

**Individual factors.** Social toxins like poverty, neighborhood crime, and entertainment violence do not have the same impact on all children; individual dif-

ferences in personality, temperament, and aptitude play an important role in ways not fully understood. Children with attention problems, impulsivity, and low verbal intelligence are more likely to engage in violent and criminal behavior in adolescence and adulthood. A 2001 study by Linda Teplin found that as many as two-thirds of youth involved in the juvenile justice system have one or more diagnosable mental or substance abuse disorders.

Violence and crime can be regarded fundamentally as learned behaviors, and youth involvement in such behaviors may reflect a multitude of different learning experiences. Nevertheless, children can learn alternatives to crime and violence as well. Controlled outcome studies, described in the Surgeon General's report and by Rolf Loeber and David Farrington, demonstrate that many prevention efforts—preschool family services, social competence training and structured recreational programs for at-risk children, and multisystemic family therapy or multidimensional treatment foster care for juvenile offenders—are successful and cost-effective.

## KANDEL, ISAAC L. (1881–1965)

A pioneer in the field of comparative education, Isaac Leon Kandel conducted extensive studies of educational systems around the world. Kandel was born in Botosani, Romania, to English parents. He attended the Manchester Grammar School and earned his B.A. in classics in 1902 and M.A. in education in 1906 at the University of Manchester. From 1906 to 1908 he taught classics at the Royal Academical Institute in Belfast, Ireland. After summer study with William Rein at the University of Jena, Kandel enrolled at Teachers College, Columbia University, completing his Ph.D. in 1910. Kandel served there as instructor and then as associate professor until 1923, when he became professor of education and an associate in the Teachers College International Institute until 1946. He then taught at the University of Manchester from 1947 to 1949. From 1924 until 1944, he edited the Teachers College International Institute's Educational Yearbook, the journal *School and Society* from 1946 to 1953, and *Universities Quarterly* from 1947 to 1949.

Over his long and prolific career, Kandel received many honors, including honorary doctorates from the University of North Carolina and the University of Melbourne, and the title of Chevalier of the Legion of Honor from France. Kandel's principal scholarly contributions were in the areas of the history of education, educational theory, and, notably, comparative and international education.

### **History of Education**

Kandel's *History of Secondary Education* (1930) represents his major contribution to the history of education. For Kandel, history should inform efforts to

resolve contemporary problems. As he put it, the historical study of education should be based upon

the sincere conviction that progress in any social field, and especially in education, is possible only with a clear understanding of the factors that have brought about the present situation, and with an intelligent appreciation of the forces that must be analyzed in order to construct a new philosophy or a new body of principles to guide in its further reconstruction. (p. x)

Accordingly, as he traced the history of secondary education, he devoted his greatest attention to developments that had the most direct bearing on the problems of his day.

Kandel identified liberal education as the "central tradition" in secondary education in Europe and the United States. He traced its foundations in ancient Rome and Greece and its development during the Middle Ages, Renaissance, and Enlightenment periods, and detailed the emergence of systems of secondary education in France, Germany, England, and the United States, emphasizing the latter two. He also devoted special attention to the education of girls. Kandel examined the impact of contemporary developments, including knowledge expansion, new social and economic circumstances wrought by the industrial revolution, and the widening acceptance of democratic ideals, on the tradition of liberal education in the secondary school.

Specifically, Kandel discerned among recent trends in secondary education in industrial democracies a recognition of the role of education in promoting national welfare and economic growth and an increasing respect for achieving the full develop-

ment of the individual regardless of social origins. Kandel identified the potential conflict between provision of educational opportunity to all individuals and selection for social and economic roles as a central problem of secondary education.

### Comparative and International Education

Kandel's approach to comparative education comprised more than sheer description of administrative, curricular, and instructional practices in particular countries. Such descriptions and the compilation of data pertaining, for example, to national expenditures, per pupil costs, enrollment figures, and dropout rates were necessary but insufficient tasks for understanding educational systems. He presciently warned of the limitations of comparative use of statistical measures of student achievement to determine educational purposes and standards of student performance. Kandel maintained that the sociopolitical milieu exerted a greater impact on school practice than educational theories. Kandel conceived comparative education as the study of the ways particular countries addressed educational problems in the context of their respective social, political, and cultural traditions. Comparative studies of education were therefore premised upon an understanding of the social and economic life of the culture under study.

In his most important work in the field, *Comparative Education* (1933), Kandel stated, "The chief value of a comparative approach to [educational] problems lies in an analysis of the causes which have produced them, in a comparison of the differences between the various systems and the reasons underlying them, and, finally, a study of the solutions attempted" (p. xix). Kandel viewed each national education system as a "laboratory" in which solutions to educational problems were tested and implemented. Kandel hoped that comparative education, by distilling common principles from variegated national contexts, would contribute to the development of a philosophy of education, that is, an educational theory, based not merely on metaphysical and ethical ruminations, but on practical, empirical grounds as well. Additionally, Kandel sought through comparative study of national education systems to promote international understandings and sympathies.

### Educational Theory

Kandel's work in the area of educational theory largely took the form of a critique of Progressive ed-

ucation. He wrote his most significant work in this area, *The Cult of Uncertainty* (1943), in a tone and temper marked by a vehemence uncharacteristic of his scholarship on educational history and comparative education. In this work Kandel detected "the American traditions of rootlessness, of practicality, and of desire for new sensations" manifest both in the philosophy of pragmatism and in Progressive education (p. 90). Kandel rejected the tendency of child-centered Progressives to advocate a "nothing-fixed-in-advance" approach to curriculum in which education began and ended with the individual student's present interests and inclinations. Kandel advocated inculcating "common understanding, common knowledge, common ideals, and common values" through liberal education (p. 126). Although Kandel advanced an incisive critique of the excesses of child-centered forms of Progressivism, his overgeneralization of his criticisms to all Progressive education (exclusive only of John Dewey and Boyd Bode, both of whom he evoked to attack other Progressives), undermined his argument.

An avowed essentialist, Kandel viewed subject matter not as potential evidence for the resolution of social problems, but as a stable source of values to guide social behavior. He criticized science as overly relativistic and touted the primacy of the liberal arts curriculum. Scholars have argued that Kandel's commitment to traditional liberal arts education contradicted his recognition of the need for reform engendered by changing social, economic, and political values and conditions. Indeed, Kandel's principal, if not sole, concession to Progressive education involved a recognition of its value for improving "traditional methods of instruction," although he gave principal credit for that to psychology (p. 94). Although he viewed essentialism as occupying a sort of educational middle ground between traditionalism and Progressivism, he held little hope for a synthesis of the two approaches.

### KEPPEL, FRANCIS C. (1916–1990)

Educational leader and administrator, Francis C. Keppel was born in New York City. He was raised in an atmosphere of liberal reform; his father, Frederick P. Keppel, served as a dean at Columbia University and in 1923 was appointed president of the Carnegie Corporation of New York. Among the elder Keppel's many interests was the role of education in achieving social equality, and one of his most important decisions was to sponsor Gunnar Myrdal's groundbreaking study of racial inequality, leading to Myrdal's publication of *An American Dilemma* in 1944. Francis Keppel was educated at Groton before entering Harvard in 1934, and apparently inherited many of his father's liberal proclivities, helping to cultivate a vision of equality that came to influence the course of American education.

After earning a B.A. in English literature in 1938 and being elected to Phi Beta Kappa, Keppel decided to pursue an abiding interest in sculpture, spending a year at the American Academy in Rome. In this regard Keppel exhibited a sensibility he may have acquired from his grandfather, an art dealer. Finding that his talents did not match his aspirations, however, Keppel returned to Harvard to take a position as assistant dean of admissions, marking the beginning of a long association with that institution. After several years of service as an officer in the U.S. Army's Information and Education Division during World War II, Keppel returned once again to Harvard to

become assistant to the provost. It was in this capacity, through his efforts to locate candidates to lead the university's Graduate School of Education, that he caught the eye of Harvard President James Bryant Conant. Keppel so impressed Conant, who was unsettled at the lack of suitable candidates, that he appointed him to the job. Thus, at age thirty-two Keppel became the youngest dean at Harvard.

Conant's choice turned out to be judicious. Keppel was an energetic, imaginative, and effective leader for the Harvard Graduate School of Education, helping to transform it from a small concern focused on training administrators into a dynamic center of innovation and reform. During his fourteen years as dean, the school more than quadrupled in size, applications increased tenfold, and the endowment swelled. The school grew in influence as well. The thrust of Keppel's efforts at Harvard was in keeping with his liberal disposition: improving the quality of teaching, testing reform ideas, and suggesting innovations for practice. He expanded the master of arts in teaching program, an avenue for talented college graduates interested in becoming teachers. He also promoted experiments in team teaching, programmed learning, curricular reform, and educational television. Although most of these ideas had little long-term impact on educational practice, they reflected a spirit of innovation and originality that set Harvard apart from other education schools. At the same time, the school became an important center of education scholarship, and Keppel helped to forge ties to other departments in the social sciences and humanities at Harvard. He was a widely respected leader nationally as well, serving on a number of important committees, task forces and councils during his tenure as a dean.

In 1962 U.S. President John F. Kennedy appointed Keppel to the post of U.S. commissioner of education, the start of a four-year term in federal service. It was in this capacity that Keppel's liberal predilections and his abilities as a leader exerted their greatest influence. He was an aggressive proponent of civil rights, and threatened to withhold federal funds from racially segregated school districts under provisions for equal educational opportunity in the Civil Rights Act of 1964. It was this posture of assertive enforcement that many observers believe led southern schools to begin complying with desegregation directives in the 1960s.

In addition to this, Keppel generally is credited with being a major force behind the drafting and

passage of the Elementary and Secondary Education Act (ESEA) of 1965, which substantially increased the federal role in public education. Working closely with President Lyndon Johnson and legislative leaders, Keppel helped to craft provisions leading to the establishment of Title I of the act, providing funds for schools serving poor children. He was a strong believer in providing educational opportunities to all children, declaring that education “must make good on the concept that no child within our society is either unteachable or unreachable.” When the cabinet-level office of Health, Education and Welfare was established in 1965, Keppel became assistant secretary for education.

Keppel also played a leading role in the establishment of the National Assessment of Educational Progress (NAEP), which was intended to be a means of comparing the performance of schools in different parts of the country and helping to raise academic standards. He helped to secure the passage of groundbreaking federal legislation in the areas of higher education, workforce training, and library services. In each of these instances, the federal role in general education was expanded significantly.

Keppel’s reform propensities eventually landed him in trouble, and he departed Washington under a cloud of controversy. In 1965 he threatened to withhold some \$32 million in funds from the Chicago Public Schools in response to charges that the system was illegally segregated by race, a decision based largely on an investigation conducted by the U.S. Civil Rights Commission. This was a volatile issue in Chicago, where local leaders were under intense public criticism for inequities between schools attended by black and white students. Exercising his considerable political clout, Chicago Mayor Richard J. Daley made a decisive phone call to the White House that eventually resulted in a number of changes in the administration of federal funds. As a consequence, Chicago’s schools received their federal monies, and shortly thereafter Keppel left government service. Ultimately, responsibility for supervising withholding actions was shifted from the Office of Education to the Justice Department.

After leaving Washington, Keppel became chief executive officer of the General Learning Corporation, a publishing and broadcasting venture. In 1974 he became director of the Aspen Institute for Humanistic Studies for a Changing Society for several years before returning to Harvard in 1977 as a senior lecturer in the Graduate School of Education. He

also served on a number of boards in these years, including those of Harvard, the City University of New York, the International Development Research Centre in Ottawa, and Lincoln Center for the Performing Arts, as well as education reform commissions in New York and elsewhere. During the 1980s he continued to provide commentary on the state of American education from his post at Harvard, giving a final interview in tandem with his longtime colleague Harold Howe just before his death in 1990.

Equipped only with a B.A. in English literature, Francis Keppel enjoyed a career as one of the nation’s leading educational figures in the twentieth century. He helped to establish a prominent graduate school of education, and contributed directly to one of the greatest eras of educational expansion and reform in American history. An energetic proponent of expanding the federal role in education, he lived to see these ideas fall out favor toward the end of his life. Even this, however, cannot diminish the magnitude of his accomplishments, and the considerable imprint he has left on the schools of the early twenty-first century.

## KERSCHENSTEINER, GEORG (1854–1932)

---

A dominating figure in the German Progressive education movement, Georg Kerschensteiner gained an international reputation as promoter of activity schools, civic instruction, and vocational education.

Born into an impoverished merchant family, Kerschensteiner taught at elementary schools (*Volksschule*) before he attended gymnasium and university, passed the state examination for secondary school teachers (1881), and earned the Ph.D. degree at the University of Munich (1883). In 1895, after twelve years of teaching at a gymnasium, he was elected school superintendent of Munich, a position he held until his retirement in 1919. In this capacity, he devoted his energies to a reorganization of elementary and vocational education, implementing in particular two innovations: the "activity school" (*Arbeitsschule*) and the "continuation school" (*Fortbildungsschule*). To the activity school, Kerschensteiner introduced workshops, kitchens, laboratories, and school gardens for the upper grades of the elementary school, and developed a kind of project method, with the intent to increase and elevate the students' learning motivation, their problem-solving capacities, their self-esteem, and their moral character. Kerschensteiner's continuation school was a mandatory part-time school for all boys and girls between the ages of fourteen and seventeen who had finished the compulsory eight-year elementary school and were working. As apprentices and young laborers they received eight to ten hours of instruction weekly; in addition to practical training they attended classes in religion, composition, mathematics, and civics—subjects that were taught in close connection with their specific trades.

In this way Kerschensteiner tried to foster their liberal education and further their social advancement; he stressed, however, that the main aim of education had to be citizenship (*staatsbürgerliche Erziehung*). The activity school and the continuation school were to make useful and purposeful citizens: first, by guiding the student to his proper life work;

second, by planting the idea that each vocation had its place in serving society; and third, by teaching the student that through a vocation society grew to a more perfect community. Kerschensteiner appealed to the students' practical bent by building the learning process upon their active participation in work projects and extracurricular activities chosen in accordance with their own interests. Participation and project work were to convert the school from a place of individual and intellectual singularity into a place of practical and socially serviceable plurality.

His work brought him high recognition, making Munich the "pedagogical Mecca" for educators from all over the world. He received invitations to lecture in Europe, Russia, and America; his books were even translated into Turkish, Chinese, and Japanese. An admirer of John Dewey and his foremost interpreter in Germany, Kerschensteiner toured the United States in 1910 on behalf of the National Society for the Promotion of Industrial Education. By this he hastened the most vigorous debate of the Progressive era with Dewey, David Snedden, Charles Prosser, Charles McCarthy as protagonists, resulting in the Munich system of vocational education (e.g. dual control and continuation schools) becoming in part the model for Wisconsin's Cooley Bill of 1911 and the Federal Smith-Hughes Act of 1917.

In England, Switzerland, and Japan his concept of compulsory continuing education had a similar impact on school reform and legislation. From 1912 to 1918 Kerschensteiner was, on the liberal ticket, member of the German Parliament (Reichstag) in Berlin. After his retirement, from 1918 to 1930, he served as professor of education at the University of Munich, publishing numerous books and articles, among them *Die Seele des Erziehers und das Problem der Lehrerbildung* (1921; The soul of the educator and the problem of teacher education), *Theorie der Bildung* (1926; Theory of culture), and *Theorie der Bildungsorganisation*, (1933; Theory of the educational system).

Kerschensteiner's philosophy of education was influenced by contemporary Neoidealists and opposed to the classical ideal of culture as conceived by Wilhelm von Humboldt. Whereas Humboldt (and Dewey for that matter) claimed that general education had to precede specific education, Kerschensteiner maintained that vocational, not general, education was to be the focal center of teaching and the "golden gate to culture and humanity." Only the individual, he claimed, who finds himself through

his work can, in the course of his development, become a truly cultivated person. Having worked his way up from humble beginnings, Kerschensteiner based all his educational innovations on a democratic impetus that was designed to overcome the rigid caste structure of German society, break up its inflexible school system, and increase the occupational opportunities for talented youth from the lower classes.

Apart from *Die Entwicklung der zeichnerischen Begabung* (1905; The development of talent for drawing) and *Wesen und Wert des naturwissenschaftlichen Unterrichts* (1914; Nature and value of science instruction), his most important books and articles published before World War I are available in English: *Education for Citizenship* (1911; *Die staatsbürgerliche Erziehung der deutschen Jugend* [1901]); *Three Lectures on Vocational Education* (1911); *A Comparison of Public Education in Germany and in the United States* (1913); *The Idea of an Industrial School* (1913; *Begriff der Arbeitsschule* [1912]); *The Schools and the Nation* (1914; *Grundfragen der Schulorganisation* [1907]).

## KILPATRICK, WILLIAM H. (1871–1965)

Progressive educational philosopher and interpreter of John Dewey’s work, William Heard Kilpatrick was born in White Plains, Georgia, the son of a Baptist minister. Educated in village schools, he graduated from Mercer University in Macon, Georgia, moving on to do graduate work in mathematics at Johns Hopkins University. Kilpatrick served as a public school principal in Georgia before returning to his alma mater to teach and briefly serve as Mercer’s acting president. In 1906 he became embroiled in a series of controversies with the institution’s president that resulted in the board of trustees holding a “heresy” trial, after which Kilpatrick resigned. In 1908 he moved to New York City to begin his doctoral studies at Teachers College, Columbia University, where John Dewey, one of his major professors, called him the best student he ever had. His dissertation, which he defended in 1911, was a history of colonial Dutch schools in New York. Beginning his work at Teachers College as a part-time administrator in the Appointment Office and a history of education instructor, Kilpatrick eventually attained a full-time teaching appointment in the philosophy of education, which he held from 1912 to 1937.

Kilpatrick’s meteoric rise in educational circles began with the publication in 1918 of his article “The Project Method” in the *Teachers College Record*. In that article Kilpatrick provided a practical approach to implementing John Dewey’s educational philosophy. Drawing on Dewey’s earlier work, *Interest and Effort*, he attempted to demonstrate how students could engage in purposeful activity at the intellectual, physical, and affective levels. The inclusion of projects matched the child-centered approach advocated by Progressive educators at this time. The emphases that projects placed on individual learning, on reflective activity, and on the development of the whole child struck a resonant chord with teachers of the period. “The Project Method” was an immediate bestseller among educators and launched Kilpatrick’s national public career.

Other reasons for Kilpatrick's rising influence in American education were his effective teaching and charismatic public-speaking ability. Often teaching classes in excess of 600 students, he was able to use group work, discussion, and summary lectures to enrich the educational experience for his students. Kilpatrick was known for his cultured Georgian accent, his thick mane of white hair, and his perceptive blue eyes, all contained within a small, energetic frame. His popularity was such that the New York City press gave him the moniker "Columbia's Million Dollar Professor." Although his salary never approached that figure, the tuition his classes generated for the coffers of Columbia University did exceed that amount during his quarter century of service to Teachers College.

Kilpatrick's career at Teachers College came to a close amid controversy. Dean William Russell decided to enforce the institution's mandatory retirement age, and his action set off a national firestorm among educators when Kilpatrick was the ruling's first casualty. It became a cause célèbre at several national conferences during 1936, with John Dewey wading into the controversy to support Kilpatrick's continued appointment. Kilpatrick's final class in 1937 consisted of 622 students, bringing to 35,000 the number of students he had taught at Teachers College. Living almost another three decades, Kilpatrick was active in his retirement, leading the New York Urban League, the Progressive Education Association, and the John Dewey Society as its first president. He continued writing and speaking in addition to teaching summer school classes at such universities as Stanford, Northwestern, and Minnesota. His involvement in organizations often brought him into conflict with the major conservatives of the day, including Robert Hutchins, Father Charles Coughlin, and William Randolph Hearst. Kilpatrick's activities also placed him within the ranks of influential liberals in post-World War II America, including Eleanor Roosevelt, Ralph Bunche, and Bayard Rustin.

Kilpatrick's consistent Progressive message was that schools needed to be more child-centered, democratic, and socially oriented. After World War II, critics attacked many of the ideas and practices of Progressive education. They saw a curriculum that lacked rigor and students who were academically unprepared to compete with in a global economy. Specific criticism aimed at Kilpatrick emerged in the school reform literature of the 1980s and 1990s. Sup-

porters of a traditional curriculum, such as E.D. Hirsch and Diane Ravitch, viewed the Progressive philosophy that Kilpatrick had espoused as the principal cause for what, in their opinion, was a decline in the academic standards of American schools. Over the same period, though, numerous Progressive-oriented pedagogies were implemented in the nation's classrooms. These innovations included cooperative learning, team teaching, individualization of instruction, and the experiential elements of the middle school movement. These student-centered practices, along with Kilpatrick's unswerving commitment to democratic principals in the schools, form the bedrock of his legacy. In one of his final statements, John Dewey said that Kilpatrick's works "form a notable and virtually unique contribution to the development of a school society that is an organic component of a living, growing democracy" (Tenenbaum, p. x).

### KNOWLEDGE BUILDING

In what is coming to be called the “knowledge age,” the health and wealth of societies depends increasingly on their capacity to innovate. People in general, not just a specialized elite, need to work creatively with knowledge. As Peter Drucker put it, “innovation must be part and parcel of the ordinary, the norm, if not routine.” This presents a formidable new challenge: how to develop citizens who not only possess up-to-date knowledge but are able to participate in the creation of new knowledge as a normal part of their work lives.

There are no proven methods of educating people to be producers of knowledge. Knowledge creators of the past have been too few and too exceptional in their talents to provide much basis for educational planning. In the absence of pedagogical theory, learning-by-doing and apprenticeship are the methods of choice; but this does not seem feasible if the “doing” in question is the making of original discoveries, inventions, and plans. Rather, one must think of a *developmental trajectory* leading from the natural inquisitiveness of the young child to the disciplined creativity of the mature knowledge producer. The challenge, then, will be to get students on to that trajectory. But what is the nature of this trajectory and of movement along it? There are three time-honored answers that provide partial solutions at best. Knowledge building provides a fourth answer.

One approach emphasizes foundational knowledge: First master what is already known. In practice this means that knowledge creation does not enter the picture until graduate school or adult work, by which time the vast majority of people are unprepared for the challenge.

A second approach focuses on subskills. Master component skills such as critical thinking, scientific method, and collaboration; later, assemble these into competent original research, design, and so forth. Again, the assembly—if it occurs at all—typically occurs only at advanced levels that are reached by only a few. Additionally, the core motivation—advancing the frontiers of knowledge—is missing, with the result that the component skills are pursued as ends

in themselves, lacking in authentic purpose. Subskill approaches remain popular (often under the current banner of “twenty-first century skills”) because they lend themselves to parsing the curriculum into specific objectives.

A third approach is associated with such labels as “learning communities,” “project-based learning,” and “guided discovery.” Knowledge is socially constructed, and best supported through collaborations designed so that participants share knowledge and tackle projects that incorporate features of adult teamwork, real-world content, and use of varied information sources. This is the most widely supported approach at present, especially with regard to the use of information technology. The main drawback is that it too easily declines toward what is discussed below as shallow constructivism.

Knowledge building provides an alternative that more directly addresses the need to educate people for a world in which knowledge creation and innovation are pervasive. Knowledge building may be defined as the production and continual improvement of ideas of value to a community, through means that increase the likelihood that what the community accomplishes will be greater than the sum of individual contributions and part of broader cultural efforts. Knowledge building, thus, goes on throughout a knowledge society and is not limited to education. As applied to education, however, the approach means engaging learners in the full process of knowledge creation from an early age. This is in contrast to the three approaches identified above, which focus on kinds of learning and activities that are expected to lead eventually to knowledge building rather than engagement directly in it.

The basic premise of the knowledge building approach is that, although achievements may differ, the *process* of knowledge building is essentially the same across the trajectory running from early childhood to the most advanced levels of theorizing, invention, and design, and across the spectrum of knowledge creating organizations, within and beyond school. If learners are engaged in process only suitable for a school, then they are not engaged in knowledge building.

#### **Learning and Knowledge Building: Important Distinctions**

An Internet search turned up 32,000 web pages that use the term “knowledge building.” A sampling of

these suggests that business people use the term to connote knowledge creation, whereas in education it tends to be used as a synonym for learning. This obscures an important distinction. Learning is an internal, unobservable process that results in changes of belief, attitude, or skill. Knowledge building, by contrast, results in the creation or modification of public knowledge—knowledge that lives “in the world” and is available to be worked on and used by other people. Of course creating public knowledge results in personal learning, but so does practically all human activity. Results to date suggest that the learning that accompanies knowledge building encompasses the foundational learning, subskills, and socio-cognitive dynamics pursued in other approaches, along with the additional benefit of movement along the trajectory to mature knowledge creation. Whether they are scientists working on an explanation of cell aging, engineers designing fuel-efficient vehicles, nurses planning improvements in patient care, or first-graders working on an explanation of leaves changing color in the fall, knowledge builders engage in similar processes with a similar goal. That goal is to advance the frontiers of knowledge as they perceive them. Of course, the frontiers as perceived by children will be different from those perceived by professionals, but professionals may also disagree among themselves about where the frontier is and what constitutes an advance. Dealing with such issues is part of the work of any knowledge building group, and so students must learn to deal with these issues as well. Identifying the frontier should be part of their research, not something preordained. The knowledge building trajectory involves taking increasing responsibility for these and other high-level, long-term aspects of knowledge work. This distinguishes knowledge building from collaborative learning activities. Keeping abreast of advancing knowledge is now recognized as essential for members of a knowledge society. Knowledge building goes beyond this to recognize the importance of creating new knowledge. The key distinction is between learning—the process through which the rapidly growing cultural capital of a society is distributed—and knowledge building—the deliberate effort to increase the cultural capital of society.

### Shallow versus Deep Constructivism

“Constructivism” is a term whose vagueness beclouds important distinctions. Knowledge building is clearly a constructive process, but most of what

goes on in the name of constructivism is not knowledge building. To clarify, it is helpful to distinguish between shallow and deep forms of constructivism. The shallowest forms engage students in tasks and activities in which ideas have no overt presence but are entirely implicit. Students describe the activities they are engaged in (e.g., planting seeds, measuring shadows) and show little awareness of the underlying principles these tasks are to convey. In the deepest forms of constructivism, people are advancing the frontiers of knowledge in their community. This purpose guides and structures their activity: Overt practices such as identifying problems of understanding, establishing and refining goals based on progress, gathering information, theorizing, designing experiments, answering questions and improving theories, building models, monitoring and evaluating progress, and reporting are all directed by the participants themselves toward knowledge building goals.

Most learner-centered, inquiry-based, learning community, and other approaches labeled “constructivist” are distributed somewhere between these extremes of shallow and deep constructivism. Participants in this middle ground are engaged to a greater or lesser extent with ideas and they have greater or lesser amounts of responsibility for achieving goals, but the over-arching responsibility and means for advancing the frontiers of knowledge are either absent or remain in the hands of the teacher or project designer. The idea of “guided discovery” suggests this middle ground. Middle-level constructivist approaches are best categorized as constructivist learning rather than knowledge building. Knowledge building calls for deep constructivism at all educational levels; it is the key to innovation.

### Knowledge Building Environments

In knowledge building, ideas are treated as real things, as objects of inquiry and improvement in their own right. Knowledge building environments enable ideas to get out into the world and onto a path of continual improvement. This means not only preserving them but making them available to the whole community in a form that allows them to be discussed, interconnected, revised, and superseded.

Threaded discourse, which is the predominant Internet technology for idea exchange, has limited value for this purpose. Typically, ideas are lodged within conversational threads, contributions are un-

modifiable, and there is no way of linking ideas in different threads or assimilating them into larger wholes. By contrast, CSILE/Knowledge Forum, a technology designed specifically to support knowledge building, has these required provisions and scaffolding supports for idea development, graphical means for viewing and reconstructing ideas from multiple perspectives, means of joining discourses across communities, and a variety of other functions that contribute to collaborative knowledge building. Contributions to a community knowledge base serve to create shared intellectual property, and give ideas a life beyond the transitory nature of conversation and its isolation from other discourses. Thus the environment supports sustained collaborative knowledge work, integral to the day-to-day workings of the community, as opposed to merely providing a discussion forum that serves as an add-on to regular work or study.

A shared workspace for knowledge building enables a self-organizing system of interactions among participants and their ideas and helps to eliminate the need for externally designed organizers of work. Advances within this communal space continually generate further advances, with problems reformulated at more complex levels that bring a wider range of knowledge into consideration. Thus there is a compounding effect, much like the compounding of capital through investment. Supporting such compounding and social responsibility for the collective work is the main challenge in the principled design of knowledge building environments.

In keeping with the belief that the process of knowledge building is fundamentally the same at beginning and advanced levels, and across sectors and cultures, Knowledge Forum is used from grade one to graduate school, and in a variety of knowledge-based organizations in countries around the world.

### **Social Aspects of Knowledge Building**

Educational approaches of all kinds are subject to what is called the “Matthew effect”: The rich get richer. The more you know the more you can learn. This is as close to a law of nature as learning research has come. It can be used to justify loading the elementary curriculum with large quantities of content. However, another potent principle is that knowledge needs to be of value to people in their current lives, not merely banked against future needs. This is part of the justification for activity and project-based methods where work is driven by students’ own

interests. In knowledge building this Deweyan principle is carried a step farther: Advances in understanding produce conceptual tools to achieve further advances in understanding. Thus there is a dynamism to knowledge building that can be a powerful motivator.

The Matthew effect foretells a widening gap between haves and have-nots in education, one that may already be manifesting itself in the widening income gap between the more and the less well-educated. No educational approach can be expected to solve the related equity problems, but knowledge building offers signal advantages. The knowledge building trajectory offers value all along its course, not just at its upper reaches. At all stages people are building authentic knowledge that is immediately useful to themselves and their community in making sense of their world. They are also developing skills and habits of mind conducive to lifelong learning. It is not assumed that everyone will come out equal in the end, but possibilities for continual advancement remain open for all.

From a social standpoint, the ability to connect discourses within and between communities opens new possibilities for barrier-crossing and mutual support. Successful knowledge-building communities establish socio-cognitive norms and values that all participants are aware of and work toward. These include contributing to collective knowledge advances, constructive and considerate criticism, and continual seeking of idea improvements. Grade one students, participants with low-literacy levels, and workers in knowledge-creating organizations can all adopt such norms, which then serve as a basis for cooperation across the developmental trajectory and among culturally diverse groups.

Knowledge building has been shown to yield advantages in literacy, in twenty-first century skills, in core content knowledge, in the ability to learn from text, and in other abilities. However, it is the fact that knowledge building involves students directly in creative and sustained work with ideas that makes it especially promising as the foundation for education in the knowledge age.

## KNOWLEDGE MANAGEMENT

Due to the wealth of information, the knowledge explosion, and the rapid development of information and communication technologies at the start of the twenty-first century, it is essential to handle complex information and knowledge intelligently and responsibly. Therefore, it is necessary to manage knowledge on an individual as well as on an organizational level. Knowledge management basically encompasses the deliberate and systematic handling of knowledge and the precise use of knowledge in organizations (companies, schools, universities etc.). However, if knowledge management is to be established as a long-term strategy, it must address the following factors simultaneously: *individual, organization, and technology*.

In most cases an organization's involvement with knowledge management is not the end in itself

but connected to specific goals, that can be deduced from the organization's superordinate goals, either directly or indirectly. In other words, to be economically justifiable, knowledge management has to contribute added value to the organization's efforts to meet its overacting goals. This "value added" must be specific and measurable in relationship to organizational goals and their achievement.

### Basics of Knowledge Management

The formulation of knowledge goals is the starting point of knowledge management on an individual as well as on an organizational level. The process of knowledge evaluation can be seen as the end of the knowledge management processes. There is a feedback loop from evaluation to goals in that the results of the evaluation may lead to changes in the knowledge goals. A wide range of possible tasks and processes are relevant between goal setting and evaluation. These can be grouped into four kinds of processes that are closely connected and interactive: *knowledge representation, knowledge communication, use of knowledge, and development of knowledge*. These categories describe the knowledge management processes on an individual as well as on an organizational level.

**Knowledge goals.** The formulation and identification of knowledge goals is necessary to provide the initial direction for the knowledge management activities. Carefully planned knowledge management processes are the basis of knowledge goals on an individual as well as on an organizational level.

**Evaluation.** Evaluation can be seen as the final stage of the four knowledge management processes. On both an individual as well as on an organizational level it is necessary in evaluation to estimate if the knowledge goals have been reached within this context.

**Knowledge representation.** Knowledge representation describes the process of knowledge identification, preparation, documentation and actualization. The main goal of this category is to transform knowledge into a format which enhances the distribution and exchange of knowledge.

**Knowledge communication.** In knowledge communication, processes are combined which concern the distribution of information and knowledge, the mediation of knowledge, knowledge sharing, and the co-construction of knowledge, as well as knowledge-based cooperation. These activities necessitate two

or more people communicating directly, indirectly face-to-face, or in a virtual environment.

**Development of knowledge.** The development of knowledge includes not only processes of external knowledge procurement (i.e. through cooperative efforts, consultants, new contacts, etc.) or the creation of specific knowledge resources like research and development departments. The formation of personal and technical knowledge networks are also part of the development of knowledge.

**Use of knowledge.** Use of knowledge focuses on the *de facto* transformation of knowledge to products and services. This category is of special interest because it shows the effectiveness of the preceding actions in the range of the categories such as knowledge representation, knowledge communication and development of knowledge.

### **Knowledge Management in the Organization**

With the goal of knowledge management to develop the potential for learning of individuals and organizations by developing, exchanging, and using knowledge, knowledge management can be seen as a prerequisite for innovations in organizations.

In this context knowledge management is often regarded as a concept and instrument for the realization of the metaphor of the learning organization. Concepts regarding the learning organization emphasize almost the same goals as knowledge management; but in actuality knowledge management can be regarded as a prerequisite for the creation and maintenance of a learning organization. If an organization (company, school, university etc.) is able to handle its knowledge resources well, it can react to shifts in the marketplace faster and more flexibly. Thus it demonstrates its capability to learn. The learning ability of employees provides a major competitive advantage in the framework of the increasing market pressure. In this context, individual and team-based learning are as important as the documentation and distribution of knowledge within an organization.

### **Knowledge Management and the Individual**

The individual as the initial point of knowledge management has been neglected, especially as knowledge management has become a topic important in the business world. Most companies at first relied on technology-based knowledge management, which has mostly led to the implementation of databases.

On the basis of an intensive analysis of the subject of knowledge management, the conclusion can be drawn that most attempts to manage the resource of knowledge have failed. Today it is clear that knowledge management approaches can only be successful if the individual plays a major role in the process. But it is the individual acting as a member of a community that is critical. Etienne Wenger introduced the idea of communities of practice in the workplace as providing added value to companies. According to Wenger, a *community of practice* is a community in which the members are informally bound by what they do together and by what they have learned through mutual engagement in these activities. Communities are highly self-organized, and it is the responsibility of the members to control the community and distribute the work among its members. Thus self-management, communication skills, the capacity for teamwork and the handling of knowledge are valuable skills for the members of communities. These individual knowledge management competencies are not only important in the range of communities but also for life in a knowledge society. To be able to cope with the new challenges of a knowledge society these skills become core competencies of every individual.

### **Knowledge Management in Formal Education**

It is the task of schools and universities to provide students with basic knowledge management skills needed for life in a rapidly changing society. However, the traditional system of schools and universities does not meet the requirements of a knowledge society. Schools and universities should be transformed into learning organizations where knowledge management comes to life. The core aim should be the mediation of deep understanding of topics and the development of individual knowledge management skills. This new orientation requires a holistic change process in schools. In schools the analog of communities of practice is learning communities. Learning communities offer multifaceted possibilities for the integration of knowledge-management processes in schools and universities. Communities can be developed among the learners within the school. Thus long-term and deep engagement with a topic, interdisciplinary learning, and the development of social skills can be facilitated. At the same time, the exchange of knowledge between the teachers can be stimulated by implementing communities among teachers. In this context the initiation of a commu-

nity that reaches out over the school boundaries can further enhance this process of knowledge sharing and mutual learning.

### Issues in Implementation

In this context the question arises of how the implementation of knowledge management processes to organizations can be facilitated. Within the field of knowledge management, research activities are still limited primarily to case studies. On the basis of several case studies with focus on small and medium-sized companies, six critical success factors for the implementation of knowledge management processes have been found. These factors can also be applied to different kinds of organizations (companies, schools, universities, etc.).

**Corporate culture.** Successful implementation of knowledge management is closely related to the corporate culture. However, these cultural changes need time. In the context of the implementation of knowledge management activities, it is important to know how knowledge management initiatives interact with the culture and to determine how the culture should be changed.

**Qualification of employees.** The competencies and motivation of employees strongly influence the success of knowledge management. Thus human resource development and the design of incentive-systems are highly important.

**Learning culture.** The implementation of knowledge management can be seen as a step-by-step learning process which has to be nurtured.

**Management support.** Knowledge management activities only have the opportunity to be successful if they are supported by the executive board.

**Integration of knowledge processes to organization's processes.** It is important to connect knowledge management closely to the organization's processes in order to gain acceptance and for reasons of economical legitimacy.

**New information and communication technologies.** The implementation of knowledge management does not necessarily have to be connected to an investment in

new information and communication technologies. The potential for such technologies evolves only if the cultural and organizational conditions exist.

To confirm and empirically verify these findings further research—basic as well as applied research—is needed in the field of knowledge management. Basic and applied research should be closely connected. Moreover, research questions should be oriented on authentic and current problems. Research initiatives on knowledge management should be designed to be interdisciplinary and extremely precise. Furthermore they should be based on a wide range of methods.

## KOHLBERG, LAWRENCE (1927–1987)

---

Lawrence Kohlberg virtually developed the fields of moral psychology and moral education through his pioneering cognitive developmental theory and research. Kohlberg's work grew out of a lifelong commitment to address injustice. After graduating from high school at the end of World War II, he volunteered as an engineer on a ship that was smuggling Jewish refugees from Europe to Palestine through the British blockade. He was captured, interred in Cyprus, escaped, fled to a kibbutz in Palestine, and made his way back to the United States where he joined another crew transporting refugees.

A passionate reader of the Great Books throughout his life, Kohlberg completed his undergraduate degree from the University of Chicago in one year. In 1958 he received his doctoral degree in psychology after writing a dissertation on developmental changes in children's moral thinking. This dissertation, which evaluated children's responses to the fictional dilemma of an impoverished man who steals an expensive drug for his dying wife, became one of the most cited unpublished dissertations ever. Kohlberg taught briefly at Yale, then at the University of Chicago, and finally at Harvard's Graduate School of Education, where he established the Center for Moral Education.

When Kohlberg began his graduate studies, American psychologists, who were for the most part behaviorists, did not even use the word *moral*. Kohlberg's broad intellectual pursuits, which embraced philosophy, sociology, and psychology, led him to challenge mainstream thinking. In his dissertation and subsequent research, he drew on a moral philosophical tradition extending from Socrates to Kant that focused on the importance of moral reasoning and judgment. Although Kohlberg was heavily influenced by Jean Piaget's research and played a major role in advancing Piaget's cognitive developmental paradigm in the United States, James Mark Baldwin,

John Dewey, and George Herbert Mead also significantly affected Kohlberg's thinking.

Kohlberg's empirical research yielded an original and fecund description of moral development. In his dissertation, he presented a cross-section of children and adolescents with a set of moral dilemmas and asked them to justify their judgments with a series of probing questions. Using an abductive "bootstrapping" method, he derived a sequence of moral types, which became the basis for his well-known six stages of moral judgment.

### Stages of Moral Judgment

Kohlberg modified his descriptions of the stages and method for coding them from the time of his dissertation to the publication of the *Standard Issue Scoring Manual* in 1987. Stage one is characterized by blind obedience to rules and authority and a fear of punishment. Stage two is characterized by seeking to pursue one's concrete interests, recognizing that others need to do the same, and a calculating instrumental approach to decision-making. Stage three is characterized by trying to live up to the expectations of others for good behavior, by having good motives, and by fostering close relationships. Stage four is characterized by a concern for maintaining the social system in order to promote social order and welfare. Stage five is characterized by judging the moral worth of societal rules and values insofar as they are consistent with fundamental values, such as liberty, the general welfare or utility, human rights, and contractual obligations. Stage six is characterized by universal principles of justice and respect for human autonomy.

Kohlberg hoped that his stages could provide a framework for moral education. He noted, however, that one could not simply assume that a higher stage was a better stage; one had to make a philosophical argument that the higher stages were more adequate from a moral point of view. It was only then that educators could find a warrant for pursuing moral development as an aim of education. In his provocative essay, "From Is to Ought: How to Commit the Psychological Fallacy and Get Away with It in the Study of Moral Development," Kohlberg demonstrated a parallelism between psychological descriptive and philosophical-normative analyses of the stages, a parallelism, which, he contended, led to a complementarity and even convergence of the two analyses.

In addition to the moral hierarchy of the stages, Kohlberg made four other fundamental claims for

his moral stage approach that are directly relevant to moral education. First, he, like Piaget, conceived of the stages as constructed and reconstructed by individuals through interacting with their social environment. Kohlberg sharply distinguished his constructivist/interactionist approach from approaches which emphasize primarily the environment (socialization approaches) or the individual (maturationist approaches). Second, he posited that the stages of moral development are universal. Third, he held that the stage formed an invariant sequence of development without skips or reversals. Finally, he maintained that his stages were holistic structures or organized patterns of moral reasoning. Kohlberg and his colleagues attempted to support these claims through twenty years of longitudinal and cross-cultural research.

### Moral Education

When he turned his attention to moral psychology to moral education, Kohlberg was faced with the objection that any form of teaching virtue involved the imposition of an arbitrary personal or religious belief. Kohlberg appealed to the U.S. Constitution to demonstrate the principles of justice upon which the American government is based are, in fact, the very principles at the core of his highest stages. For Kohlberg civic and moral development are one and the same. Kohlberg endorsed Dewey's view that development (intellectual as well as moral) ought to be the aim of education and that schools ought to provide an environment conducive to development. As a constructivist, Kohlberg advocated that schools provide an environment that encouraged active exploration rather than passive learning. Later Kohlberg would put these ideas into practice when he instituted the just community first in prisons and later in schools.

Kohlberg's first research-based contribution to moral education was the moral discussion approach. He started working on the approach in 1967 after his graduate student, Moshe Blatt, had found that the discussion of moral dilemmas led to a modest but significant development in moral reasoning. The moral discussion approach offered educators a way of promoting moral development while avoiding the Scylla of indoctrination and Charybdis of values relativism. The key to the moral discussion approach was to stimulate a lively exchange of points of view that would lead to the disequilibrium necessary for cognitive development. The discussion leader acted

as a facilitator and Socratic questioner, encouraging students to consider the perspective of others and to examine the adequacy of their own arguments.

The moral discussion approach should not be confused with the values clarification approach that was very prevalent in the 1960s and 1970s. The values clarification approach, which started with the assumption that values were a matter of individual preference, represented the extreme of individual relativism. According to this approach, the role of the teacher was limited to helping individual students to become aware of their own values and to tolerate the values of others.

Kohlberg saw the moral discussion approach as one way of promoting development to higher stages of moral reasoning through thoughtful and critical dialogue about moral issues. He was concerned that traditional approaches to character education with their emphasis on exhortation and role-modeling oversimplified the process of moral development and encouraged conformity. Kohlberg wanted an approach to moral education that could address the social issues of his day, such as racism and social inequality. He also wanted an approach to moral education that went beyond cultural relativism. Moral education, he believed, ought to be about fostering universal principles of justice, not transmitting the values of one's particular culture or subculture.

Kohlberg's abiding concern for building a more just society through moral education led him to question whether the moral discussion approach was sufficient. Classroom moral discussions focused on hypothetical dilemmas or problems in history and literature, but not the problems that students encountered in school. Dilemma discussions stopped at individual students' moral reasoning and did not address the school environment. Kohlberg challenged schools to take a more radical approach and become "little republics" ruled not by an aristocracy of philosopher-teachers but by a democracy of teachers and students, engaged in philosophical deliberation about the good of their community.

Kohlberg's most significant contribution to moral education was the just community approach, which he developed over the last thirteen years of his life by working closely with teachers and students in three alternative high schools. The just community approach has two major features: direct-participatory democracy and a commitment to building community, characterized by a strong sense

of unity. Direct participatory democracy not only involves students in moral discussions about problems in school, but also helps students to feel responsible for solving those problems. The role of democracy in the just approach cannot be understood, however, apart from the role that community plays in providing a goal for the democracy and shared expectations for student participation.

Kohlberg's view of community was heavily influenced by his observations of a kibbutz high school in Israel and his appropriation of Émile Durkheim's collectivist theory of moral education. Kohlberg believed that American schools were too focused on individual achievement and failed to offer students an opportunity to become attached to a group that could offer them a rich social and moral experience. He urged that teachers become advocates of community in democratic meetings by challenging students to commit themselves to upholding shared values of caring, trust, and collective responsibility. While asking teachers and students to devote themselves to promoting the welfare of the community, he established procedures for checking the power of the group over the individual. Kohlberg believed that the just community approach was needed not only to promote moral development but also to revitalize a sense of democratic civic engagement in a culture that had become excessively focused on private interest.

## **LABRANT, LOU L. (1888–1991)**

Lou L. LaBrant served as a language arts teacher and a Progressive-education leader from 1906 through 1971. Born in Hinkley, Illinois, LaBrant began her teaching career in public high schools and experimental schools throughout the Midwest during the first two decades of the twentieth century. She completed an undergraduate degree in Latin at Baker University (1911) and, after making a final commitment to education, pursued an M.A. from the University of Kansas (1925), followed by a Ph.D. from Northwestern University (1932). Her professional career spanned eight decades: She was a founding staff member of the University School of Ohio State University (1932–1942), a professor of education at New York University (1942–1953), president of the National Council of Teachers of English (1953–1954), and head of the humanities division at Dillard University (1958–1971), where she implemented the nationally recognized pre-freshman program for African-American students.

### **Teaching Reading and Writing**

An early and consistent proponent of Deweyan progressivism, LaBrant championed holistic and child-centered approaches to teaching reading and writing. She stood at the beginning of the nearly century-long debate between isolated and integrated instructional strategies for language arts classes. Throughout her career LaBrant focused on student choice in reading instruction. From her first years in teaching LaBrant both promoted and practiced free reading programs at experimental schools and major universities. John Dewey (1859–1952) had argued that educators could not know the exact needs of

students in their lives, and consequently LaBrant believed teachers had to provide students with conceptual understanding that could be applied in chaotic and unpredictable situations. Essentially, she argued that the reading process was far more important than the specific works students read. She rejected movements such as Great Books and traditional approaches to the canon of required works of literature.

From a late-twentieth-century perspective, LaBrant also spoke for holistic approaches to writing instruction. Isolated grammar instruction, a traditional approach (often taught through text or workbook exercises), had proved to have little or no transfer to student writing, LaBrant emphasized; thus students needed to choose their own topics and writing forms that would be polished after the piece was written—and if the content warranted polishing. LaBrant often chastised teachers who had students correct surface features of empty, mechanical writing. Her ultimate, though not simple, stance was that students learned to write by writing and grew as readers by reading.

### **Educational Leader**

As a writer, editor (*Journal of Educational Method*, 1939–1943), and educational leader (notably as president of the National Council of Teachers of English), LaBrant voiced her support for integrated language arts methodologies; further, she took a variety of stances on the many issues facing education and humanity through much of her career. Paradoxically, she always believed that reading and writing instruction should not be a separate course, traditionally called English, but an integrated part of all content areas. At the center of many of her beliefs

was her contention that language contributed directly to mental health; she warned repeatedly against belief in “word magic”—that saying something could make it happen or be true. Her focus on language instruction was a direct attack on provincialism. She offered, as many Progressives did, the scientific method as the touchstone for growing as a learned individual—a focus she contributed to and carried from her years at the University School of Ohio State University.

Further, she advocated experimental education, especially experimental schools that worked to move students toward content instead of imposing content on the student. As a member of the University School’s faculty at Ohio State University, she was directly involved in the eight-year study concerning Progressive education. Her interest in experimentalism included a call for educational methods to be research-based and child-centered. Since she lived through several back-to-basics movements, she also hoped that progressive measures would curb the many moves to standardized education: in her mind, an approach that stifles students’ abilities. Her work in research-based and child-centered educational methodologies places her in the constructivist camp of learning theory and in opposition to the traditional behaviorist slant of public education.

A more subtle contribution from LaBrant was her work with disenfranchised and minority students over her career. She applied her progressive methodologies to Native American students in the Midwest, Hispanic and multiethnic classes in New York (P.S. 65), and African-American students entering Dillard University. Her body of work helps to show that traditional education often failed minority students, and Progressive education could and did help bridge the gap left by traditional schooling.

### Teaching Teachers

LaBrant was characterized by those who knew her as a demanding person—a teacher with the highest of standards. Many recognized a rigidness and arrogance in LaBrant. She challenged teachers, especially when training them in the teaching of reading and writing.

Whether in her graduate courses or during her many lectures, LaBrant promoted research-based progressive ideas, presenting them assertively, even perhaps excessively so. She appeared to care little for feelings hurt, and was driven to seek and apply the

best practices known at that time to ensure that each student receive the most fulfilling and lasting education possible. In the wake of the advocate LaBrant were devoted followers and a sprinkling of angered opponents.

## LAND-GRANT COLLEGES AND UNIVERSITIES

America’s land-grant colleges and universities were brought into being through the Morrill Act of 1862. This unprecedented federal legislation supported a new vision for higher education flowing from a confluence of agricultural, industrial, scientific, political and educational interests in the years before the U.S. Civil War.

By 1873, 26 land-grant colleges and universities were in operation; by 1900, 65; by 1975, 72; and by 2000, 106 (see Table 1). As these institutions developed, they influenced American higher education (and its more than 4,000 postsecondary institutions) well out of proportion to their number. According to the scholar Clark Kerr, the grant movement had a profound effect on the modern American university system and shaped its development throughout the late nineteenth and twentieth centuries.

By the beginning of the twenty-first century, U.S. land-grant colleges and universities had become a model for developing nations seeking to harness their own institutions of higher learning to promote economic development and higher standards of living. The motives typically attributed to the land-grant college movement include the democratization of higher education to serve the working class; the development of an educational system designed to meet utilitarian and “useful” ends; and a desire to emphasize the emerging applied sciences, particularly agricultural science and engineering.

New scholarship has shown that before the Civil War a number of American colleges had begun to accommodate these emerging needs. But these institutions were local in orientation and lacked the collective ability to call attention to the ways in which they were adapting to the demands of a growing nation. By contrast, the land-grant colleges were the outgrowth of a movement that culminated in conscious, organized action to affect federal and state policy. What made the land-grant colleges unique in American higher education was their exclusive relationship with the federal government and a shared set of obligations to their sponsoring states.

The 1850s saw unrelated efforts by Jonathan B. Turner, a professor at Illinois College, and U.S. Senator Justin S. Morrill of Vermont to champion bills calling for federally sponsored agricultural or industrial colleges, but these initiatives failed. Morrill’s penultimate bill passed Congress in 1859, but it was vetoed by President James Buchanan—largely on the grounds that a federal role in education was unconstitutional.

The Morrill Act of 1862, signed by President Abraham Lincoln, granted vast holdings of federal lands to states based on the size of their congressional delegations. The lands were to be sold to provide an endowment for the establishment of “at least one college where the leading object shall be, without ex-

cluding other scientific and classical studies and including military tactics, to teach such branches of learning as related to agriculture and the mechanic arts . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life.” Most states did a poor job of selling their lands, however. The meager profits used for the endowments were insufficient to sustain these growing educational institutions, which offered free tuition but had yet to receive any state funds.

The first institutions to function as land-grant colleges during the Civil War were two agricultural schools that had been chartered by their respective states in 1855: Michigan Agricultural College (now Michigan State University) and the Agricultural College of Pennsylvania (now The Pennsylvania State University). By 1873, twenty-four land-grant institutions enrolled 2,600 students—about 13 percent of the total U.S. collegiate population. Despite this early success, the quarter-century following the Civil War was a dismal period for land-grant colleges. Their facilities were sparse and primitive, and critics began to marshal their forces. Congress launched an investigation, which vindicated the schools. The farmers’ organization, the Grange, launched a similar inquest, condemning the colleges for their failure to attract agricultural students. Well into the twentieth century, engineering—not agriculture—was the most popular course of study at land-grant schools.

Land-grant colleges turned the corner from struggle to stability around 1890, chiefly because of two federal acts. The Hatch Act of 1887 established and annually funded agricultural experiment (research) stations at land-grant colleges. Then came the Morrill Act of 1890, best known for giving states the right to designate “separate-but-equal” land-grant colleges for blacks. Soon after this, seventeen such schools were operating in Southern and border states. But the act’s main purpose was to create annual federal appropriations to support general educational programs, from English to engineering. This dependable flow of funds provided the long-sought financial foundation the colleges needed and encouraged state governments to make annual appropriations as well. The pivotal figure in these legislative victories was George W. Atherton, president of The Pennsylvania State College. When his lobbying force of land-grant college presidents and agricultural scientists congealed in 1887 into the Association of American Agricultural Colleges and Experiment

Stations—the first formal organization of peer higher education institutions in America—Atherton was elected its first president.

Since 1900, land-grant institutions have been strengthened by more than a dozen federal acts. For example, the Smith-Lever Act of 1914 established the Cooperative Extension Service in agriculture and home economics, to be carried out by land-grant institutions in connection with U.S. Department of Agriculture. Eighty years later, in 1994, the Elementary and Secondary Education Reauthorization Act conferred land-grant status on twenty-nine Native American colleges.

The major land-grant universities are powerhouses of research and graduate education. Of the top twenty institutions in total research-and-development spending for fiscal 1998, eleven (55%) were land-grant universities, according to the National Science Foundation. Of the top twenty institutions awarding the most earned doctorates in fiscal 1998, twelve (60%) were land-grant institutions. The fruits of these research and graduate programs have profoundly benefited the world. The production of pure uranium, pioneering developments in television and the transistor, advances in meteorology, the field ion microscope and the cyclotron, the isolation of helium, new plant strains resistant to disease and

insects—these and much more have come from land-grant institutions.

The land-grant college movement has forged an enduring legacy. Egalitarianism and educational populism, practical or useful education, applied science and research, public service and outreach, and, perhaps most importantly, the idea that the federal government has a key role to play in educational policy—these tenets have become generalized throughout the whole of American higher education.

## LANGUAGE ACQUISITION

Almost every human child succeeds in learning language. As a result, people often tend to take the process of language learning for granted. To many, language seems like a basic instinct, as simple as breathing or blinking. But language is not simple at all; in fact it is the most complex skill that a human being will ever master. That nearly all people succeed in learning this complex skill demonstrates how well language has adapted to human nature. In a very real sense, language is the complete expression of what it means to be human.

Linguists in the tradition of Noam Chomsky tend to think of language as having a universal core from which individual languages select out a particular configuration of features, parameters, and settings. As a result, they see language as an instinct that is driven by specifically human evolutionary adaptations. In their view, language resides in a unique mental organ that has been given as a “special gift” to the human species. This mental organ contains rules, constraints, and other structures that can be specified by linguistic analysis.

Psychologists and those linguists who reject the Chomskyan approach often view language learning from a very different perspective. To the psychologist, language acquisition is a window on the operation of the human mind. The patterns of language emerge not from a unique instinct but from the operation of general processes of evolution and cognition. For researchers who accept this emergentist approach, the goal of language acquisition studies is to understand how regularities in linguistic form emerge from the operation of low-level physical, neural, and social processes. Before considering the current state of the dialog between the view of language as a hard-wired instinct and the view of language as an emergent process, it will be useful to review a few basic facts about the shape of language acquisition and some of the methods that are used to study it.

## The Basic Components of Human Language

Human language involves both receptive and productive use. Receptive language use occurs during the comprehension or understanding of words and sentences. Productive language use involves idea generation and the articulation of words in speech. Both reception and production utilize the four basic structural components of language:

1. **Phonology:** The system of the sound segments that humans use to build up words. Each language has a different set of these segments or phonemes, and children quickly come to recognize and then produce the speech segments that are characteristic of their native language.
2. **Semantics:** The system of meanings that are expressed by words and phrases. In order to serve as a means of communication between people, words must have a shared or conventional meaning. Picking out the correct meaning for each new word is a major learning task for children.
3. **Grammar:** The system of rules by which words and phrases are arranged to make meaningful statements. Children need to learn how to use the ordering of words to mark grammatical functions such as subject or direct object.
4. **Pragmatics:** The system of patterns that determine how humans can use language in particular social settings for particular conversational purposes. Children learn that conversations customarily begin with a greeting, require turn taking, and concern a shared topic. They come to adjust the content of their communications to match their listener's interests, knowledge, and language ability.

These four basic systems can be extended and elaborated when humans use language for special purposes, such as for poetry, song, legal documents, or scientific discourse. The literate control of language constructs additional complex social, cognitive, and linguistic structures that are built on top of the four basic structural components.

## Methods for Studying Language Acquisition

The methods used to study language development are mostly quite straightforward. The primary method involves simply recording and transcribing what

children say. This method can be applied even from birth. Tape recordings become particularly interesting, however, when the child begins systematic babbling and the first productions of words. Using videotape, researchers can link up the child's use of verbal means with their use of gesture and non-linguistic cries to draw attention to their desires and interests.

Methods for studying comprehension are a bit more complicated. During the first year, researchers can habituate the infant to some pattern of sounds and then suddenly change that pattern to see if the infant notices the difference. From about nine months onward, children can be shown pictures of toys along with their names, and then researchers can measure whether the children prefer these pictures to some unnamed distracter pictures. Later on, children can be asked to answer questions, repeat sentences, or make judgments about grammar. Researchers can also study children by asking their parents to report about them. Parents can record the times when their children first use a given sound or word or first make some basic types of child errors. Each of these methods has different goals, and each also has unique possibilities and pitfalls associated with it. Having obtained a set of data from children or their parents, researchers next need to group these data into measures of particular types of language skills, such as vocabulary, sentences, concepts, or conversational abilities.

## Phases in Language Development

William James (1890) described the world of the newborn as a "blooming, buzzing confusion." It is now known, however, that, on the auditory level at least, the newborn's world is remarkably well structured. The cochlea (in the inner ear) and the auditory nerve (which connects the inner ear with the brain) provide extensive preprocessing of signals for pitch and intensity. In the 1970s and 1980s, researchers discovered that human infants were specifically adapted at birth to perceive contrasts in sounds such as that between /p/ and /b/, as in the words *pit* and *bit*. Subsequent research showed that even chinchillas are capable of making this distinction. This suggests that much of the basic structure of the infant's auditory world can be attributed to fundamental processes in the mammalian ear. Moreover, there is evidence that some of these early perceptual abilities are lost as the infant begins to acquire the distinctions actually used by the native lan-

guage. Beyond this basic level of auditory processing, it appears that infants have a remarkable capacity to record and store sequences of auditory events. It is as if the infant has a tape recorder in the brain's auditory cortex that records input sounds, replays them, and accustoms the ear to their patterns.

Children tend to produce their first words sometime between nine and twelve months. One-year-olds have about 5 words in their vocabulary on average, although individual children may have none or as many as thirty; by two years of age, average vocabulary size is more than 150 words, with a range among individual children from as few as 10 to as many as 450 words. Children possess a vocabulary of about 14,000 words by six years of age; adults have an estimated average of 40,000 words in their working vocabulary at age forty. In order to achieve such a vocabulary, a child must learn to say at least a few new words each day from birth.

One of the best predictors of a child's vocabulary development is the amount and diversity of input the child receives. Researchers have found that verbal input can be as great as three times more available in educated families than in less educated families. These facts have led educators to suspect that basic and pervasive differences in the level of social support for language learning lie at the root of many learning problems in the later school years. Social interaction (quality of attachment; parent responsiveness, involvement, sensitivity, and control style) and general intellectual climate (providing enriching toys, reading books, encouraging attention to surroundings) predict developing language competence in children as well. Relatively uneducated and economically disadvantaged mothers talk less frequently to their children compared with more educated and affluent mothers, and correspondingly, children of less educated and less affluent mothers produce less speech. Socioeconomic status relates to both child vocabulary and to maternal vocabulary. Middle-class mothers expose their children to a richer vocabulary, with longer sentences and a greater number of word roots.

Whereas vocabulary development is marked by spectacular individual variation, the development of grammatical and syntactic skills is highly stable across children. Children's early one-word utterances do not yet trigger the need for syntactic patterns, because they are still only one-word long. By the middle of the second year, when children's vocabularies grow to between 50 and 100 words, they

begin to combine words in what has been termed "telegraphic speech." Utterances typical of this period include forms such as "where Mommy," "my shoe," "dolly chair," and "allgone banana."

At this same time, children are busy learning to adjust their language to suit their audience and the situation. Learning the pragmatic social skills related to language is an ongoing process. Parents go to great efforts to teach their children to say "please" and "thank you" when needed, to be deferential in speaking to adults, to remember to issue an appropriate greeting when they meet someone, and not to interrupt when others are speaking. Children fine-tune their language skills to maintain conversations, tell stories, ask or argue for favors, or tattle on their classmates. Early on, they also begin to acquire the metalinguistic skills involved in thinking and making judgments about language.

As children move on to higher stages of language development and the acquisition of literacy, they depend increasingly on broader social institutions. They depend on Sunday school teachers for knowledge about Biblical language, prophets, and the geography of the Holy Land. They attend to science teachers to gain vocabulary and understandings about friction, molecular structures, the circulatory system, and DNA. They rely on peers to understand the language of the streets, verbal dueling, and the use of language for courtship. They rely on the media for role models, fantasies, and stereotypes. When they enter the workplace, they will rely on their coworkers to develop a literate understanding of work procedures, union rules, and methods for furthering their status. By reading to their children, telling stories, and engaging in supportive dialogs, parents set the stage for their children's entry into the world of literature and schooling. Here, again, the parent and teacher must teach by displaying examples of the execution and generation of a wide variety of detailed literate practices, ranging from learning to write through outlines to taking notes in lectures.

### **Special Gift or Emergence?**

Having briefly covered the methods used to study language acquisition and the basic phases in development, it is now possible to return to this question: Is language development best characterized as the use of a "special gift" or as an emergent result of various cognitive, neural, physiological, and social pres-

tures? There are good arguments in favor of each position.

The special gift position views language as an instinct. People are often overpowered by the “urge to speak.” Young children must feel this urge when they interact with others and have not yet learned how to use words correctly. It is important to recognize, however, that crickets, birds, snakes, and many other species can be possessed by a similar urge to produce audible chirps, songs, and rattling. In themselves, these urges do not amount to a special gift for language learning. Better evidence for the special gift comes from the study of children who have been cut off from communication by cruel parents, ancient Pharaohs, or accidents of nature. The special gift position holds that, if the special gift for language is not exercised by some early age, perhaps six or seven, it will be lost forever. None of the isolation experiments that have been conducted, however, can be viewed as providing good evidence for this claim. In many cases, the children are isolated because they are brain-injured. In other cases, the isolation itself produces brain injury. In a few cases, children as old as six to eight years of age have successfully acquired language even after isolation. Thus, the most that can be concluded from these experiments is that it is unlikely that the special gift expires before age eight.

The second form of evidence in favor of the notion of a special gift comes from the observation that children are able to learn some grammatical structures without apparent guidance from the input. The argumentation involved here is sometimes rather subtle. For example, Chomsky noted that children would never produce “Is the boy who next in line is tall?” as a question deriving from the sentence “The boy who is next in line is tall.” Instead, they will inevitably produce the question as, “Is the boy who is next in line tall?” That children always know which of the forms of the verb *is* to move to the front of the sentence, even without ever having heard such a sentence from their parents, indicates to Chomsky that language must be a special gift.

Although the details of Chomsky’s argument are controversial, his basic insight here seems solid. There are some aspects of language that seem so fundamental that humans hardly need to learn them. Nevertheless, the specific structures examined by linguistic theory involve only a small set of core grammatical features. When looking more generally at the full shape of the systems of lexicon, phonology,

pragmatics, and discourse, much greater individual variation in terms of overall language proficiency appears.

To explain these differences, it is necessary to view language learning as emerging from multiple sources of support. One source of support is the universal concept all humans have about what language can be. A second source of support is input from parents and peers. This input is most effective when it directly elaborates or expands on things the child has already said. For example, if the child says “Mommy go store,” the parent can expand the child’s production by saying “Yes, Mommy is going to the store.” From expansions of this type, children can learn a wide variety of grammatical and lexical patterns. A third source of support is the brain itself. Through elaborate connections among auditory, vocal, relational, and memory areas, humans are able to store linguistic patterns and experiences for later processing. A fourth source of support are the generalizations that people produce when they systematize and extend language patterns. Recognizing that English verbs tend to produce their past tense by adding the suffix *-ed*, children can produce overgeneralizations such as “goed” or “runned.” Although these overgeneralizations are errors, they represent the productive use of linguistic creativity.

Individual children will vary markedly in the extent to which they can rely on these additional sources of support. Children of immigrant families will be forced to acquire the language of the new country not from their parents, but from others. Children with hearing impairments or the temporary impairments brought on by otitis media (ear infections) will have relatively less support for language learning from clear auditory input. Blind children will have good auditory support but relatively less support from visual cues. Children with differing patterns of brain lesions may have preserved auditory abilities, but impaired ability to control speech. Alternatively, other children will have only a few minor impairments to their short-term memory that affect the learning of new words.

Because language is based on such a wide variety of alternative cognitive skills, children can often compensate for deficits in one area by emphasizing their skills in another area. The case of Helen Keller is perhaps the best such example of compensation. Although Keller had lost both her hearing and her vision, she was able to learn words by observing how her guardian traced out patterns of letters in her

hand. In this way, even when some of the normal supports are removed, children can still learn language. The basic uses of language are heavily overdetermined by this rich system of multiple supports. As a child moves away from the basic uses of language into the more refined areas of literacy and specific genres, progress can slow. In these later periods, language is still supported by multiple sources, but each of the supports grows weaker, and progress toward the full competency required in the modern workplace is less inevitable.

#### LANGUAGE AND EDUCATION

In discussions of language and education, language is usually defined as a shared set of verbal codes, such as English, Spanish, Mandarin, French, and Swahili. But language can also be defined as a generic, communicative phenomenon, especially in descriptions of instruction. Teachers and students use spoken and written language to communicate with each other—to present tasks, engage in learning processes, present academic content, assess learning, display knowledge and skill, and build classroom life. In addition, much of what students learn is language. They learn to read and write (academic written language), and they learn the discourse of academic disciplines (sometimes called academic languages and literacies). Both definitions of language are important to understanding the relationship between language and education.

As suggested by M. A. K. Halliday, the relationship between language and education can be divided

into three heuristic categories: (1) learning language, (2) learning through language, and (3) learning about language.

### Learning Language

In their early years, children are learning both spoken and written language. They are developing use of complex grammatical structures and vocabulary; communicative competence (rules for the appropriate and effective use of language in a variety of social situations); comprehension of spoken and written language; and ways to express themselves.

Educational programs for young children often emphasize curriculum and instruction to facilitate language learning. With regard to spoken language, instructional programs may emphasize opportunities to comprehend a variety of genres from directions to narratives and opportunities to experiment with modes of expression. With regard to written language, classrooms for young children provide opportunities to learn alphabetic symbols, grapho-phonemic relationships (letter-sound relationships), basic sight vocabulary, and comprehension strategies; and also feature the reading of stories designed for young children. Young children may also have opportunities to learn how to express themselves through written language, including opportunities to form letters, words, sentences, and text structures, and opportunities to learn how to put together a written story.

There is debate about the extent to which classrooms for young children's language learning should provide didactic, teacher-centered instruction or student-centered instruction. Those who support a didactic approach argue that children whose language performance is below that of their peers need explicit instruction to catch up. These advocates argue that the home and community environments do not provide all children with the experiences needed to be proficient and effective users of language and that direct instruction with grammatical forms, vocabulary, and pronunciation can help certain students catch up with their peers. A similar argument is made for the didactic instruction of written language. Written language, it is argued, is sufficiently different from spoken language as to require explicit instruction. Research noting the importance of phonological awareness to reading development is cited as rationale for a parts (letters and sounds) to whole (fluent oral reading) curriculum.

The alternative argument is that children are inherently *wired* as language learners and that providing them with a stimulating, rich language environment supplies them with the tools they need for further developing their spoken and written language abilities. Although teachers may provide instruction, the instruction should follow the student's needs and interests rather than being prescribed in a predetermined manner. The complexity of language processes requires that children be allowed to engage in complete or whole-language activities rather than in isolated skill instruction activities that distort language processes by stripping them of their complexity (and also making them harder to learn). The learning of written language is not viewed as being much different from the learning of spoken language, and thus learning processes similar to those used in learning spoken language are advocated for the learning of written language.

In the United States another set of debates surrounds language learning by children whose native language is other than English. First, there are debates with regard to goals. Some educators advocate for a sole emphasis on the learning of English, whereas others advocate for continued language growth in English and in the child's native language. Arguments focus on the role of the public school in providing a common language that can produce national unity. Although few argue against the importance of learning English, questions are raised about whether national unity depends on English only as opposed to English plus additional languages. With regard to the learning of English, one side advocates for an immersion approach that prohibits use of the child's native, first language. Immersion is believed to provide the child with motivation and language input for becoming a fluent English speaker. The other side argues that stripping children of their native language also strips them of their culture and heritage. Further, these advocates point to studies that show that learning English is not inhibited by continued language growth in a native language or by bilingual educational programs. Learning to read in one's native language has been shown by research studies to provide a useful foundation for students learning to read in English.

At the secondary and postsecondary level, students learn the language of a broad range of disciplines. They must learn how to argue in discipline-specific ways and to read and write discipline-specific texts each with their own set of language

conventions. Studies have suggested, however, that in some classrooms and schools there is little difference in the texts or written assignments across disciplines. In both science and social studies, for example, students may encounter the same pattern of reading a textbook chapter and answering end-of-chapter questions.

### Learning through Language

Learning in classrooms is primarily accomplished through language. Teachers lecture, ask questions, orchestrate discussions, and assign reading and writing tasks. Students engage in academic tasks through reading, writing, exploring the Internet, giving verbal answers to teacher questions, listening to teacher lectures and student presentations, participating in whole-class and instructional peer group discussions, memorizing written text and vocabulary, and so on. A major thrust of classroom research since the 1970s has focused on the following question: What forms of classroom language practice facilitate what kinds of learning?

One classroom language practice of interest to educational researchers has been *scaffolding*. Scaffolding is the process through which teachers and students interact with each other by building on each other's immediately previous statement or utterance. For example, after making a statement, a teacher might ask a student a question intended to help the student elaborate or probe the academic topic a bit further. The student, building on the teacher's question or comment, produces a statement with more depth, complexity, or insight. The teacher might then ask another question to scaffold the learning even further, and so on. Through scaffolding, teachers may be able to help students explore and understand academic issues beyond what they are able to do on their own. Scaffolding can occur between teachers and students and also among students.

Another classroom language practice that has received a great deal of attention from educational researchers has been the teacher initiation–student response–teacher feedback/evaluation sequence (known as I-R-F). It is also referred to as the asking of known-information questions and recitation questioning. Of concern to researchers and educators are the constraints that such a conversational structure places on academic learning. I-R-F sequences rarely provide students with opportunities to provide long or in-depth responses, and the

knowledge displayed is contextualized by feedback or evaluation that subsequently comes from the teacher. I-R-F sequences rarely allow opportunities to explore explanations or to debate issues. The teacher always generates the topics, and thus students do not have opportunities to ask questions. Further, I-R-F sequences provide students with few opportunities to practice the creation of extended spoken text. Research on I-R-F sequences has also shown, however, that they may be more complex and malleable than previously recognized. For example, instead of just providing an evaluation of the correctness of a student response, a teacher might provide additional information and *revoice* a student response in a way that models for students how to phrase the statement in the academic jargon. Such revoicings can be considered a kind of scaffolding. I-R-F sequences may also be useful to display to the whole class what counts as the knowledge for which they are accountable. And I-R-F sequences may also be used by teachers as a classroom management tool, ensuring that students complete assignments and that they are paying attention.

A third classroom language practice that has received a lot of attention has been sharing time (also known as show-and-tell). Sharing time provides an opportunity for young children to develop narrative performance skills such as topic coherence, sequencing of events, structuring narrative events, and adjusting a narrative to an audience. Research shows that how students construct a narrative during sharing time may reflect narrative practices from their own families and communities. In such cases, the narrative produced by the child may differ from the narrative models that a teacher is using to evaluate the child's language performance, and as a result the teacher may negatively evaluate the child. The research on sharing time and similar classroom language practices shows that there is great variation in the narrative models, structures, and devices used across cultures and that children may experiment with many different types of narratives. Children adopt and adapt narrative models from a broad range of sources. In addition to suggesting the need for educators to be sensitive to cultural variation in narrative performance and in assessment of children's language abilities, the studies of sharing time show the close connections among education, language, and cultural variation.

Beyond questions about the effectiveness of various classroom language practices are questions

about who is able to engage in what language practices and language processes, when, and where. In other words, what constitutes equitable classroom language practices? Research on turn-taking practices has shown that a broad range of factors influence who gets a turn to talk during classroom conversations and who is less likely to get a turn. These factors may include race, gender, class, native language, and where the student is seated, among others. Some students may get or seek few turns to talk. Those students who do not get or seek turns to talk and who feel alienated from the classroom are sometimes referred to as having been *silenced*. Although students can be silenced by the behavior of the teacher or of other students, more often silencing involves a deeper social process whereby a student is inhibited from bringing into the classroom his culture, language, heritage, community, personal experience, and so on.

### Learning about Language

Perhaps the most obvious classroom practice for learning about language is through the study of grammar and spelling. As linguists point out, the grammar taught in school is a prescriptive grammar and is not what linguists mean by grammar (they mean a descriptive grammar). For those students who use Standard American English, prescriptive grammar is often very close to the language they speak. But for students who speak a variation of English other than Standard English or who speak African-American Language (which is also referred to as African-American English, Black Dialect, and Ebonics, among others), the teaching and learning of prescriptive grammar does not necessarily map onto the language they speak, and thus they are learning about a language different from the language they speak.

Another typical classroom practice for learning about language is the instruction of a second language. Learning a second language can mean one of two things: the learning of a foreign language (such as the learning of Latin, French, and Spanish in the United States) or the learning of English by those in the United States whose native language is not English. It is often the case that the teaching of a second language includes coverage of the grammar, vocabulary structures, and history of the language.

Beyond the teaching of prescriptive grammar and the explicit teaching of a second language, there is very little taught about language in K–12 class-

rooms. Although there have been experimental and one-off programs in K–12 schools that have taught students the practices of linguists, engaged them in sociolinguistic studies, helped them develop language autobiographies, and sensitized students and teachers to language variation, there exists no broad-based trend.

### African-American Language and Classroom Education

The lack of education about language and about language variation may explain, in part, the strong popular reaction to the issue of African-American Language and classroom education. In Ann Arbor, Michigan, and in Oakland, California, the issue of African-American Language and education created controversy. Despite substantial linguistic evidence as to its nature and characteristics, some observers characterized African-American Language as a non-language, as slang, or as sloppy English. As stated by a federal court in Ann Arbor in 1978 (in the case of *King v. Board of Education*), teachers sometimes negatively evaluated students' academic abilities and potential because they spoke African-American Language. The court offered a remedy designed to provide educators with the knowledge they needed to make appropriate assessments of students' academic abilities. In the popular press and in the general public there was a great deal of misunderstanding about the issues involved in the court case, with many mistakenly assuming that recognition of African-American Language as a language was either an attempt to force teachers to teach in African-American Language or an attempt to not teach African-American students to use Standard English effectively.

A similar problem occurred in 1996 when the Oakland School Board created a policy that recognized Ebonics as a language. It was widely assumed by the public that the board was recommending the use of African-American Language as a medium of instruction, and hence was abandoning African-American students to what was assumed to be a second-rate curriculum. Again popular views included mistaken assumptions: that African-American Language was not a language, that the Oakland School Board would not provide instruction in the effective use of Standard English, and that speakers of African-American Language would never be successful in the workplace. Both in the documents on which the resolution was based and in their response to the

controversy, however, the Oakland School Board made clear that their resolution was an attempt to focus attention on the educational needs of those students who spoke African-American Language and to provide them with effective instructional programs for reading, writing, academic subjects, and the learning of Standard English. The members of the board pointed out that their resolution was built on established linguistic principles and knowledge and on proven educational practices. In 1997 the Linguistic Society of America passed a resolution supporting the resolution of the Oakland School Board. That resolution pointed out that African-American Language was not slang, sloppy, or incorrect and asserted the importance of the maintenance of what the society termed "vernacular" languages.

The controversy over African-American Language in education points to the complex of relationships among language, education, national politics, and cultural politics. The languages that are spoken in schools, the languages that are taught, the use of language for learning and instruction, are all more than simple matters of pedagogical effectiveness. The definition and use of language and language education in schools are part of broader cultural and political debates about how the nation will be defined and about the structure of power relations among various ethnic, racial, economic, and linguistic groups.

## LANGUAGE ARTS, TEACHING OF

*Language arts* is the term typically used by educators to describe the curriculum area that includes four

modes of language: listening, speaking, reading, and writing. Language arts teaching constitutes a particularly important area in teacher education, since listening, speaking, reading, and writing permeate the curriculum; they are essential to learning and to the demonstration of learning in every content area. Teachers are charged with guiding students toward proficiency in these four language modes, which can be compared and contrasted in several ways. Listening and speaking involve oral language and are often referred to as *primary* modes since they are acquired naturally in home and community environments before children come to school. Reading and writing, the written language modes, are acquired differently. Although children from literate environments often come to school with considerable knowledge about printed language, reading and writing are widely considered to be the school's responsibility and are formally taught.

A different way of grouping the language modes is according to the processing involved in their use. Speaking and writing require constructing messages and conveying them to others through language. Thus they are “expressive” modes. Listening and reading, on the other hand, are more “receptive” modes; they involve constructing meaning from messages that come from others' language. (For those who are deaf, visual and spatial language modes—watching and signing—replace oral language modes.)

When one considers how children learn and use language, however, all of these divisions become somewhat artificial. Whatever we label them, all modes involve communication and construction of meaning. In effective language arts teaching, several modes are usually used in each activity or set of related activities. For example, students in literature groups may read literature, discuss it, and write about it in response journals. In 1976 Walter Loban published a study of the language growth of 338 students who were observed from kindergarten through grade twelve. He found positive correlations among the four language modes both in terms of how students developed competency in each, and of how well students ultimately used them. His study demonstrated the inter-relationships among the four language modes and influenced educators to address and more fully integrate all four of them in classrooms.

### Models of Language Arts Instruction

Many changes in language arts instruction have taken place in American schools since 1980. To understand these changes, one must be conversant with the three basic models that have given rise to variations in language arts curriculum over the years: the heritage model, the competencies model, and the process or student-centered model. Each model constitutes a belief system about the structure and content of instruction that leads to certain instructional approaches and methods. The *heritage model*, for example, reflects the belief that the purpose of language arts instruction is to transmit the values and traditions of the culture through the study of an agreed-upon body of literature. It also focuses on agreed-upon modes and genres of writing, to be mastered through guided writing experiences. The *competencies model*, on the other hand, emanates from the belief that the chief purpose of language arts instruction is to produce mastery of a hierarchy of language-related skills (particularly in reading and writing) in the learner. This model advocates the teaching of these skills in a predetermined sequence, generally through use of basal readers and graded language arts textbooks in which the instructional activities reflect this orientation. The majority of adults in this country probably experienced elementary level language arts instruction that was based in the competencies model, followed by high school English instruction that primarily reflected the heritage model. Instruction in both of these models depends heavily on the use of sequenced curricula, texts, and tests.

The third model of language arts instruction, the *process model*, is quite different from the other two models. The curriculum is not determined by texts and tests; rather, this model stresses the encouragement of language processes that lead to growth in the language competencies (both written and oral) of students, as well as exposure to broad content. The interests and needs of the students, along with the knowledge and interests of the teacher, determine the specific curriculum. Thus reading materials, writing genres and topics, and discussion activities will vary from classroom to classroom and even from student to student within a classroom.

“Authentic” assessment is the rule in these classrooms, that is, assessment that grows from the real language work of the students rather than from formal tests. Clearly the process model leads to more flexible and varied curriculum and instruction than

the other two models. While the heritage and competencies models have come under criticism for being too rigid and unresponsive to student differences, the process model has been criticized as too unstructured and inconsistent to dependably give all students sufficient grounding in language content and skills. In actuality, teachers of language arts generally strive to help their students develop proficiency in language use, develop understanding of their own and other cultures, and experience and practice the processes of reading and writing. Thus it seems that the three models are not mutually exclusive. They do, however, reflect different priorities and emphases, and most teachers, schools, and/or school systems align beliefs and practices primarily with one or another model.

### Focus on Outcomes

From a historical perspective, marked shifts in language arts instruction have taken place. In the early twentieth century, textbooks and assigned readings, writing assignments, and tests came to dominate the language arts curriculum. Instruction was characterized by a great deal of analysis of language and texts, on the theory that practice in analyzing language and drill in “correct” forms would lead students to improved use of language and proficiency in reading, writing, and discourse. Instruction was entirely teacher-driven; literature and writing topics were selected by the teacher; spelling, grammar, and penmanship were taught as distinct subjects; and writing was vigorously corrected but seldom really taught in the sense that composition is often taught today. In the 1980s a shift toward the process model emerged in the works of many language arts theorists and the published practices of some influential teachers including Donald Graves, Lucy M. Calkins, and Nancie Atwell. In 1987 the National Council of Teachers of English and the Modern Language Association sponsored a Coalition of English Associations Conference. Educational leaders from all levels came together at the conference to discuss past and present language arts teaching and to propose directions and goals to guide the teaching of language arts in the years leading up to and moving into the twenty-first century. The conference report specified the ideal outcomes of effective language arts instruction, in terms of the language knowledge, abilities, and attitudes of students. These outcomes were largely process oriented, as illustrated by the following examples of outcomes for students leaving the ele-

mentary grades, as reported by William Teale in *Stories to Grow On* (1989):

- *They will be readers and writers*, individuals who find pleasure and satisfaction in reading and writing, and who make those activities an important part of their everyday lives.
- *They will use language to understand themselves and others and make sense of their world*. As a means of reflecting on their lives, they will engage in such activities as telling and hearing stories, reading novels and poetry, and keeping journals.

Principles to guide curriculum development evolved from the conference participants’ agreed upon student outcomes, and, like the outcomes, the principles were broad and process-focused. For example, two of the original principles are: *Curriculum should evolve from a sound research knowledge base* and *The language arts curriculum should be learner-centered*. Elaborations on these and other curriculum goals deviated from earlier recommendations in that they included classroom-based ethnographic research, or action research, as well as traditional basic research in the knowledge base that informs the teaching of language arts. There was also agreement that textbooks serve best as resources for activities, but that the most effective language arts curricula are not text driven; rather they are created by individual teachers for varying communities of students.

### Language Arts Standards

During the 1990s a movement toward greater accountability in education gained momentum, leading to the development of articulated standards. Standards grow from the endeavor to link curriculum and instruction with specific outcomes—what students can demonstrate they know and are able to do. In response to this movement, the National Council of Teachers of English (NCTE) and the International Reading Association (IRA), two of the leading professional organizations in the language arts field, joined in developing a common set of national standards for the English Language Arts. These standards are more specific, detailed, and comprehensive than the guidelines from the earlier coalition conference, although that work provided a starting point for the development of the national standards. Advances in technology and communication have been rapid since 1987. In the national standards, the definition of English language arts in-

cludes viewing and visually representing as well as reading, writing, listening, and speaking. Perhaps the factor that has had the greatest impact on American schools is the immigration that has led to steadily increasing linguistic and cultural diversity in the population. The changing demographics of school populations are reflected in the newer national standards; students for whom English is not the first language are explicitly considered in the goals and recommendations.

### **IRA/NCTE Standards for the English Language Arts**

The following standards are taken from *Standards for the English Language*, published in 1996 by the National Council of Teachers of English.

Students read a wide range of print and nonprint texts to build an understanding of texts, of themselves, and of the cultures of the United States and the world; to acquire new information; to respond to the needs and demands of society and the workplace; and for personal fulfillment. Among these texts are fiction and nonfiction, classic and contemporary works.

Students read a wide range of literature from many periods in many genres to build an understanding of the many dimensions (e.g., philosophical, ethical, aesthetic) of human experience.

Students apply a wide range of strategies to comprehend, interpret, evaluate, and appreciate texts. They draw on their prior experience, their interactions with other readers and writers, their knowledge of word meaning and of other texts, their word identification strategies, and their understanding of textual features (e.g., sound-letter correspondence, sentence structure, context, graphics).

Students adjust their use of spoken, written, and visual language (e.g., conventions, style, vocabulary) to communicate effectively with a variety of audiences and for different purposes.

Students employ a wide range of strategies as they write and use different writing process elements appropriately to communicate with different audiences for a variety of purposes.

Students apply knowledge of language structure, language conventions (e.g.,

spelling and punctuation), media techniques, figurative language, and genre to create, critique, and discuss print and non-print texts.

Students conduct research on issues and interests by generating ideas and questions, and by posing problems. They gather, evaluate, and synthesize data from a variety of sources (e.g., print and non-print texts, artifacts, people) to communicate their discoveries in ways that suit their purpose and audience.

Students use a variety of technological and informational resources (e.g., libraries, databases, computer networks, video) to gather and synthesize information and to create and communicate knowledge.

Students develop an understanding of and respect for diversity in language use, patterns, and dialects across cultures, ethnic groups, geographic regions, and social roles.

Students whose first language is not English make use of their first language to develop competency in the English language arts and to develop understanding of content across the curriculum.

Students participate as knowledgeable, reflective, creative, and critical members of a variety of literacy communities.

Students use spoken, written, and visual language to accomplish their own purposes (e.g., for learning, enjoyment, persuasion, and the exchange of information).

### **Evolving Issues**

Evolving issues in language arts pedagogy hark back to the three models of instruction described earlier. The IRA/NCTE standards are process oriented, for the most part. Many individual state departments of education have developed their own language arts standards for students at various grade levels; these range from rigidly imposed standards and controlled curricula in the tradition of the skills-based model to process oriented standards and a good deal of local control over the curriculum. Educators are left with the task of reconciling such differences and designing curriculum and assessments that reflect their highest priorities. Issues similar to those in the United States have led to reforms in England—a leader, for many years, in the implementation of meaning-

based instruction in reading and writing. Recent reforms in England and Ireland maintain an emphasis on integrating language arts in instruction, while recommending increasingly structured curriculum and assessments geared toward student achievement of specified outcomes.

Large-scale immigration, one of the most important social developments of the late twentieth and early twenty-first centuries, is a global phenomenon, as noted in *Children of Immigration* (2001). As a result, increasing numbers of districts, schools, and educators in other countries as well as in the United States are faced with the necessity of adjusting the curriculum and the use of standards to make them appropriate for students of multiple language and cultural backgrounds. The tension between students' individual backgrounds and developmental levels on the one hand, and universal achievement goals in the language arts as reflected in standards on the other, provide the largest challenges to language arts teachers of the early twenty-first century.

## LANGUAGE MINORITY STUDENTS

#### SCOPE

Reynaldo F. Macías

#### IMPACT ON EDUCATION

Reynaldo F. Macías

#### SCOPE

Some nations across the globe are becoming more linguistically diverse as a result of the transnational migration of peoples. Others are experiencing an increase in their language diversity as a result of differential growths of their populations, resurgence of language and ethnic nationalism, language revitalization movements, and the official recognition and promotion of multiple languages. Governments may be recognizing the needs of regional or immigrant populations within their borders, or they may be recognizing the fruits of foreign language programs in their nations. This increase in linguistic diversity is taking place at the same time that the estimated total number of different languages in the world is decreasing. While most nations have a multilingual history they recognize as part of their heritage, some view themselves as predominantly monolingual in a dominant language—the United States is one such country. Language diversity in the United States is

not a new phenomenon, but language minorities begrudgingly receive recognition and continue to struggle for acceptance.

### Who Are Language Minorities?

Around the world, defining language minorities often sparks controversy. What constitutes a language? How big must a group be to be identified and recognized? In the United States there are some generally accepted definitions and concepts for describing these populations. Within the national population, there are groups of individuals who may be called *language minorities* or *non-English-language background* populations. These individuals are people who speak a language other than English, whether or not they also speak English, and/or they may have grown up, or lived in, an environment where a non-English language was present and influential (whether they were born in the United States or any of its jurisdictions, or because they were born and raised in a different country). It also includes the deaf and hearing-impaired. Often, there is also an ethnic dimension to these groups where language helps define identity. They are referred to as “minorities” not only because they are not a numerical majority in the nation (although they may be at more local levels), but also because they often wield little influence or power within the country. American Indians may be considered language minorities even if they speak only English because their history includes a non-English language and repressive language and cultural policies by the U.S. federal government, so that their current use of English was affected by that history.

Very often there is a concern for a subgroup of the language minority population that does not speak, understand, read, or write the dominant language—English—well enough to participate effectively in an English-only classroom. This group has been referred to in many government documents and academic studies as persons who are *non-English proficient* or *limited English proficient*. Beginning in 2000, some states have changed their official definitions for language minority students who do not know enough English to participate effectively in an English-only classroom and have begun to refer to them as *English language learners*. There is some controversy over whether this new label is sufficiently descriptive to be adequate and whether it is distinctive enough, because all school students in the United States are required to learn and master En-

glish throughout their schooling, whether or not they knew English when they entered the schools, and thus are also English language learners.

### The Size and Diversity of the Language Minority Population

In 2000 there were nearly 45 million people in the United States, about 17.6 percent of the national population (not including outlying jurisdictions such as Puerto Rico and Guam) over the age of five years, who spoke a language other than English at home. This was an increase of more than 14 million (41.1%) from the total in 1990. The largest single language spoken in the United States, after English, was Spanish, with about 26.8 million speakers (almost 60 percent of all persons who spoke a language other than English; see Table 1). The proportion of persons who spoke a language other than English who were approximately school-age (five to seventeen years of age) was just over one-fifth (21.7%) in 2000.

Three-fourths of the people who could speak a language other than English also reported that they could speak English very well or well, reflecting a high degree of bilingualism (see Table 2). This proportion varied slightly by language groups, with almost 72 percent of Spanish speakers, 86.8 percent of those who spoke another Indo-European language, 77.3 percent of those who spoke an Asian or Pacific Islander language, and 90.2 percent of those who spoke other non-English languages being able to speak English very well or well.

The number of language minority students in the public schools who were not proficient enough in English to participate effectively in an English-only classroom is more difficult to estimate than the total language minority population. The estimate for the fifty states and the District of Columbia of limited English proficient (LEP) students for 2000 was about 3.7 million. This represented about 8 percent of the total public school K–12 enrollment for the nation (46.6 million) and was an increase of about 10 percent over 1997–1998.

The largest numbers of LEP students were in the larger population states—California (about 1.5 million LEP students representing 24.9 percent of the state’s public school enrollment), Texas (555,000; 13.9%), Florida (235,000; 9.9%), New York (229,000; 8%), and Illinois (144,000; 7.1%).

In addition to the LEP students in the fifty states and the District of Columbia, there were about

SOURCE: Courtesy of author.

685,600 LEP students in the seven outlying U.S. jurisdictions (Guam, Marshall Islands, Micronesia, Northern Mariana Islands, Palau, Puerto Rico, and the Virgin Islands). In four of these U.S. jurisdictions (Marshall Islands, Micronesia, Palau, and Puerto Rico), the entire public school enrollment was reported as limited in their English proficiency. Every state and jurisdiction in the United States included LEP students in their public schools in 2000, ranging from just under 1 percent to 100 percent.

The language backgrounds of these LEP students was fairly stable over the 1990s. The largest language background reported for the public school enrollment by the states in 2000 was Spanish (76.6 percent of all students with limited proficiency in English), followed by Vietnamese (2.3%), Hmong (2.2%), Haitian and French Creole (1.1%), Korean (1.1%), and Cantonese (1%). All other languages were represented with less than 1 percent of LEP students.

Regarding the literacy abilities of the national population, data from 1992 indicated that 89 percent of the national adult population, sixteen years and older (191.3 million), reported being literate (able to read and write very well or well) in English only, 7 percent biliterate in English and another language, and 3 percent literate only in a language other than English. About 1 percent reported they were not literate in any language.

While all of these data provide a profile of the language and literacy diversity of the United States, the data describe an even more diverse population. Many of these students were foreign born and immigrants or refugees from different parts of the world.

Many more were children of immigrant or refugee parents, and a smaller number were native born of native-born parents. The number and proportion of limited English proficient students tended to coincide with those groups who have a large proportion of foreign-born members—Latinos and Asian Americans in particular. Immigration from Mexico, Latin America, and Asia was relatively high in the 1980s and 1990s—representing, during the 1990s, 27.7 percent, 13.5 percent, and 22.5 percent, respectively, of all immigration (in comparison, immigrants from Europe and Canada represented 11.4 percent and 1.7 percent, respectively, of all immigrants during the 1990s). This reflects, in part, the reversal of the explicitly selective and restrictive immigration policy priorities favoring northern and western Europe in force between 1917 and 1965. It also reflects the foreign policies of the federal government in receiving refugees from Cuba beginning in the 1960s, Vietnam in the 1970s, and Communist Eastern Europe in the 1980s, and its involvement in the civil wars of El Salvador and Nicaragua during the 1980s and 1990s.

Aside from the association with immigration, language diversity is also correlated with low academic achievement—primarily as a result of the inability of the public school systems in the country to meet the communicative and learning needs of these students. There is much controversy over whether to teach limited English proficiency students using English alone as the language of instruction or to allow the use of languages other than English for communicative, informational, and instructional purposes in the classroom—despite evidence domestically and

TABLE 2

Non-English-speaking populations, United States, 2000, by English ability							
Language	Total		English ability of non-English-language speakers (percent)

globally that bilingual instruction can work well. This is complicated by the lack of adequate numbers of teachers able and credentialed to teach bilingually. In addition, a nativist English-only movement begun in the early 1980s has targeted bilingual education and the public and private uses of non-English languages for elimination through efforts to make English the official languages of jurisdictions, to mandate English as the dominant or exclusive language of instruction, or to otherwise officially regulate or prohibit the use of non-English languages. This movement has aligned itself with restrictive immigration groups and policies and has created a chilling climate for the use of languages other than English by individuals in schools as well as in workplaces.

### Language Trends

The changes in the numbers of speakers of languages across generations is known as language shift or maintenance. There are many reasons for each of these changes. Research involving European immigrants revealed that the dominant pattern established in the United States during the first half of the twentieth century was a three-generation immigrant process: the immigrant generation was monolingual or dominant in their non-English language, the children born and raised in this country tended to be bilingual in their heritage language and English, and their children were often monolingual in English. This research did not take into account the different intergenerational language patterns of indigenous language minorities, such as American Indian communities/nations, nor did it take into account those colonial language groups incorporated into the

country through war, such as Mexicans in the southwest, or the people of Puerto Rico.

More recent research indicates that the language shift from the non-English heritage language to English takes place much more quickly today—some even argue within a single generation—as a result of the more universal schooling and the much longer time spent in schools than in the beginning of the twentieth century. This change also seems to be a result of the increasing influence of the communications media, which are dominated by monolingual English networks and programming; the chilling atmosphere created by the English-only movement and other nativist activities; and other factors. Most of these studies have been short-term studies of individual language change or para-longitudinal in design. They have not been life-cycle studies or even biographical retrospectives of individuals that reflect different language uses at different times of a person's life.

One often-stated situation that results from these changes involves the interactions between parents who are dominant or exclusive speakers of a language other than English and their children who begin to acquire English, especially through the schools, and whose acquisition and development of the non-English language is arrested. In the case of many of these non-English languages, minority children often refuse to speak the non-English language with their parents and sometimes are unable to do so, thereby disrupting the natural and nurturing interactions within these families. This situation also results from the recognition of the low status that many non-English languages have in the country and the advice of many well-meaning but uninformed and ill-advised teachers who believe that one

must give up the heritage language in order to acquire English, and so they advise the students and their families to stop using the non-English language.

What these complex processes of language change mean is that the number of English monolinguals increases among language minorities across generations, at the same time that the numbers of speakers of these non-English languages increases in the country, fed by immigration, cross-generational language sharing, and language revitalization efforts.

#### IMPACT ON EDUCATION

In 2000, the number of school-age persons (five to seventeen years of age) who spoke a language other than English in the United States was 9,769,120, or about one out of every five students (the national enrollment of public school students in 2000 was 46,857,321). This assumes, for the sake of argument,

that all of these school-age language minority children and youths were in the public schools. About 8 percent (3.7 million students) of the national public-school enrollment in 1999–2000 consisted of language minority students who were not able to use English well enough to participate effectively in an English-only classroom. The proportion of the total enrollment varies by state: In California, 25 percent of the public-school enrollment in 1999–2000 was *limited English proficient* (LEP), while the proportion was 24 percent in New Mexico, 15 percent in Alaska and Arizona, 14 percent in Texas, and 12 percent in Nevada. LEP students represent nearly 100 percent of the total public-school enrollment in the outlying areas of the United States (Marshall Islands, Micronesia, Palau, and Puerto Rico).

The diversity of students with limited ability in English is great. Some of these students are foreign-born immigrants to the United States—some with and some without prior schooling. Some of them are literate in their native language. They came to the United States at different ages and for different reasons—some to escape civil war or strife and political persecutions, while some were attracted to the opportunities in the United States, and still others drawn by its various programs of refuge and asylum. Most LEP students, however, are born in the United States to immigrant parents, and they start school with a native language other than English and with varying degrees of speaking ability in English (and so are increasingly referred to as *English language learners*, or ELLs).

The responses of the public schools to this language diversity vary, but they are generally neither comprehensive nor adequate. There are many reasons this is the case, not the least of which is the mismatch between the needs of the students and the resources and expectations of the school systems. A second reason is the ideologically based resistance to meeting language minority student needs promoted by the ethnocentric English-only movement and pro-assimilation groups throughout the country. These groups influence public and educational policy, curriculum and instruction, and school reform. The issues facing language minority students in the public schools are thus varied. Those faced by students with limited proficiency in English are particularly salient—involving the acquisition and development of English, access to the core curriculum, and high-stakes assessments.

## Learning English

Many surveys of immigrants to the United States have concluded that learning English is one of three priorities they have immediately after arriving in the country—along with gaining employment and finding a place to live. Parents of native-born language minority students also respond that they see learning English as a high priority for their children, even while they desire their children to keep their heritage languages. Unfortunately, despite the increasing numbers and proportions of language minority LEP students, most schools are neither prepared nor equipped to meet the needs of these students in teaching them English, or in providing them access to the core curriculum in other subject areas. Often the schools will sacrifice access to the core curriculum in favor of first teaching English to these students.

Students who speak a language other than English will often learn to speak and understand English before learning to read and write it, in and out of school. Much of this English-language acquisition and development depends on the age of their arrival in U.S. schools. The earlier they arrive, the more they are exposed to English—and the earlier and more easily they acquire a native-like pronunciation of the language. However, the older they are in age when they arrive, the more easily they are able to develop vocabulary in English (and the more likely they are to acquire English pronunciation with an accent). How much prior schooling students have received in their country of origin is also a factor affecting English-language acquisition. The more schooling they have had before they enter U.S. schools, the quicker they are able to adjust and excel. The more literate they are in their native language, the easier it is to learn to read and write English and succeed in U.S. schools. In addition, the kind of program students receive when they enter U.S. public schools can affect the learning of English.

Language minority students will often learn a conversational form of English before they learn an academic form of the language. It may take a relatively short time (one to three years) to gain fluency in conversational English, but it will take longer (five to seven years) to be proficient in academic English, assuming adequate instruction.

The acquisition and development of English reading and writing for language minority students who are limited in their English proficiency depends

as well on whether the students have already learned to read and write in their non-English language. If these students have learned to read in their native language first (*mother-tongue*, or *native-language literacy*), then much of the general knowledge about reading (e.g., one can make sense of print) can be transferred to learning English reading and writing (*second-language literacy*). If a student's native language uses a phonemic or alphabetic system of writing, then additional knowledge about the writing system can also be transferred to second-language literacy in English.

It is a more difficult task for a language minority student who is not proficient in English to learn how to read and write initially in English. These students must develop their oral English-language abilities *and* learn how to read and write English. The older the student, the more frequently this is required by the schools to be done simultaneously rather than sequentially (oral language development before literacy). This is more difficult for these language minority students than for native English speakers because it is being done in a more compressed time period and includes learning more language skills at one time than what is required of native English speakers (who bring to elementary school a fully-developed ability in English).

## Language of Instruction

Most language minority students with limited English abilities receive their instruction entirely through English. While there is not much good data on the services that LEP students receive in the schools, some generalizations can be made based on several national surveys. In 1993, less than 50 percent of elementary school students limited in their English proficiency received at least a quarter of their instruction in their native language. In middle schools, the percentage was 28 percent, and in high schools, 25 percent. This study also indicated that LEP students of Spanish-language background were more apt to receive this instruction in their heritage language than LEP students of other language backgrounds. In 1998, twenty-six states (which included about 40 percent of the national LEP student enrollment for that year), provided information to the federal government on the language of instruction used to teach these students. They reported that almost 26 percent of all LEP students received some of their instruction in the non-English language through bilingual education (academic instruction through

English and a non-English language); while 14 percent received all of their instruction in English only—through various forms of English-as-a-second-language programs. About 12 percent of these students received no special instructional services at all. The language of instruction was not reported for the other 48 percent of LEP students.

The size of the language minority LEP enrollment with a common language background seems to be a good predictor of the use of a non-English language for instruction. In a 1998 survey of big city school districts, the use of a non-English language (along with English) as the language of instruction was found to be more frequent for the largest language group of students of the district (usually Spanish, except for two school districts in Minnesota, which reported Hmong language LEP students as their largest group), and usually in the elementary grades. Otherwise, the preferred language of instruction was exclusively English through some form of an English-as-second-language program.

California enrolls about 40 percent of all of the LEP students in the country. The language of instruction for the great majority of these students has been exclusively English since the adoption of an initiative in 1998 that mandated the language of instruction for the state to be English and the default program for LEP students to be structured English immersion (a form of English-as-second-language instruction in which English is used exclusively or predominantly for instruction). In the spring of 2001, California school districts reported that 46.6 percent of the 1,511,299 LEP students in the state were receiving all of their instruction in English; another 26.6 percent were receiving almost all of their instruction in English, but with a small amount of the non-English language used for communication support; and 5.4 percent were receiving no special instructional services at all. Only 11.1 percent of California's LEP students were receiving bilingual education—academic instruction in both languages—as compared to 30 percent prior to the adoption of the 1998 initiative.

While most language minority students with limited English abilities are receiving some special instructional services, it is clear that almost all of these services use English as the medium of instruction. The most successful model of bilingual instruction—two-way bilingual immersion—was used in only 260 programs in twenty-three states in 2001. In addition, only half of the those enrolled in these pro-

grams were LEP students—hardly a major impact on the instructional services received by this population.

### **Access to the Core Curriculum**

The single most difficult aspect of the schooling of language minority LEP students is providing them adequate access to the core curriculum. Most school districts have opted to enforce a policy of learning English first—before these students can be taught other subject matter. This puts language minority LEP students in a precarious academic situation. Many schools are beginning to require special preparation, professional development, and even licensing for their teachers to instruct these students in English. Many language minority students who enter the schools early in their life can sometimes catch up academically with native English speakers when they work harder than these peers. However, the concentrations of language minority students are in high-minority, high-poverty schools, which are often under-resourced and struggle with hiring a fully credentialed and qualified teaching workforce. Receipt of adequate instruction is the exception, not the rule, for language minority students.

### **School–Home Communication**

The absence of teachers and other school staff who can communicate with parents of language minority students is also a problem in informing parents about the academic performance of their children, about the activities of the schools, or even about the expectations of the teachers. As language minority students, especially children, acquire some English, they often abandon the use of their heritage language. This creates another communication difficulty between children and parents in these homes that strains the quality of family interactions.

### **High-Stakes Testing**

During the 1990s the amount and frequency of high-stakes, standardized testing of students increased dramatically. Much of this testing was used as an accountability measure to identify unsuccessful schools and to measure progress towards educational standards set by the states and the federal government. These tests were given exclusively in English to all students. Language minority students with limited English abilities were often excused from this testing in the early 1990s, but increasingly were included throughout the decade and into the first de-

cade of the new millennium. This practice increased despite the fact that LEP students could not understand the language of the tests (which made the results invalid), despite the ethical concerns about such high-stakes testing, and despite the apparent violation of the Office for Civil Rights regulations on language minority testing. In contrast, local school districts tend to use a variety of tests for identification, classification, and reclassification of LEP students, and a set of multiple criteria for these administrative decisions.

## LATCHKEY CHILDREN

*Latchkey child* was a term coined to describe children who wore or carried house keys to school so that they could let themselves into their home when they returned from school. Those children were at home without adult supervision until their parents returned from work, school, or other occupations away from home.

Currently, the term *self care* is used to refer to elementary and middle school children who are without adult supervision during the after-school hours whether they are at home, at friends' houses, or in public places. Preschool children usually have not been included in studies measuring self care because it is considered inappropriate for preschool children to be unsupervised for any amount of time. However, one national study that included preschool children found that 67,000 (less than 1 percent of the preschool population) spent some time in self care. Adolescents attending high school also have not been included in studies of self care because researchers and the public consider it developmentally appropriate for high school students to care for themselves after school without direct adult supervision.

Several studies of large nationally representative samples in the United States have measured how many children are in self care by surveying parents about their children's after school care. Those studies have found that a very small percentage of families use self care as the main arrangement for their elementary and middle school age children. For example, researchers estimate that, overall, 12 percent of children between the ages of five and twelve years old care for themselves at least one afternoon per week. That report is probably an underestimate for several reasons. For one, parents have an interest in underreporting self care. Although very few states have laws governing self care, many people do not perceive self care as an optimal arrangement. For another, most families depend on a patchwork of arrangements during the week. The evidence indicates that self care is used for part of the after-school hours either regularly or on occasion by far more than 12 percent of families with elementary school children. For example, a study in one U.S. city found that approximately 33 percent of the third-grade children, 44 percent of the fourth-grade children, and slightly more than half of the fifth-grade children spent some part of the after school hours in self

care. A recent estimate of the time lag between when schools are dismissed and when parents return from work suggests that time can amount to twenty to twenty-five hours per week. Self care is one type of arrangement that fills in part of that time for the many families struggling to maintain supervision of their children during the after school hours.

Parental discretion is important in determining when and how much self care children experience. In determining when children can be unsupervised, parents often consider age, emotional maturity, and competence of the child. In general, time spent in self care increases with the age of the child. Most parents gradually transition their children to self care. Families usually start using self care by having their children spend short amounts of time unsupervised after school. As children demonstrate that they are mature enough to handle those short bouts of time alone, most parents increase the frequency and duration of self care about the time that children are entering middle school. Often, children of about ten years of age begin to desire greater autonomy than is afforded by many formal after-school programs. At about that age, children sometimes lobby their parents for more time in self care, especially if the children are dissatisfied with available after-school programs.

More boys than girls experience self care during elementary school, probably because parents tend to be more protective of daughters than sons. However, according to the findings of a large nationally representative study, boys and girls are equally likely to be unsupervised after school during eighth grade.

Family and neighborhood characteristics also are factors affecting when and how often children experience self care. Single parents employed full-time use self care more than dual parent families or than families with part-time adult workers or unemployed adults. Contrary to popular belief, children from families with higher incomes spend more time in self care than children from families with lower incomes. The reason for this is probably related to safety considerations because those families with higher incomes usually live in suburban neighborhoods that the parents rate as being safe. Indeed, urban children are in self care less often than suburban and rural children.

Researchers who have studied self care have described variations in the situations unsupervised children are in after school. Some children are alone,

others are with siblings, and yet others are with peers. Generally, children who are with siblings less than fourteen years of age have been considered to be in self care because they are unsupervised by an adult. Some self care children are at home after school. Others are out and about in their neighborhoods and communities. For example, a national study of public libraries found that the vast majority of librarians reported that latchkey children regularly used their libraries as a place to be after school. Other studies in local areas have found that some young adolescents who are unsupervised after school "hang out" with friends at shopping malls, video arcades, parks, and other such public locations.

Teachers and principals have expressed concern about their students who care for themselves after school. Those educators believe that the self-care children are not safe and that the children are at risk for academic and social emotional problems. There is some indication from surveys that the public agrees with them that self-care children are at risk developmentally. Researchers have been interested in investigating the developmental consequences of self care to determine whether those children who experienced self care suffer negative consequences. Surprisingly, despite the concern of educators and the public about safety, few studies have examined the physical dangers of self care. One report from the early 1980s found that self-care children were more likely than supervised children to be injured. No recent studies were found estimating the number of injuries from accidents, fire, or crime when children were unsupervised. Studies from the 1970s and 1980s appeared to report contradictory results about academic, behavioral, and social emotional development associated with self care. Some studies reported that there were no negative effects of self care for children's academic and social emotional adjustment. Other studies reported poorer academic and social-emotional adjustment of children experiencing self care. Since that time, a number of studies described below that were conducted in the 1990s have found that the effects of self care depend on the type and amount of self care, characteristics of the children in self care, and the circumstances in which the children live. Most of the available studies, however, have used small, nonrepresentative samples in one city or state. So, the findings of those studies must be interpreted cautiously.

Characteristics of the children themselves have been found to contribute to outcomes of self care.

The Child Development Project conducted in Tennessee and Indiana by Gregory Pettit and his colleagues investigated the associations between self care during first grade or third grade and developmental outcomes in sixth grade. That longitudinal study of 466 children from economically diverse circumstances took children's previous behavioral functioning into account in analyzing the effects of first-grade self care on sixth-grade functioning. The researchers found that, for children who were well adjusted in kindergarten, there was virtually no relationship between self care experienced during first grade and the children's behavior problems in sixth grade. However, sixth-grade children who experienced self care in first grade and who were above average in aggression and acting out behavior in kindergarten had far higher scores on aggression and acting out behavior problem scales than those children who experienced no self care in first grade.

Researchers from the Child Development Project also considered the child's age as a factor. They found that more self care in either first or third grade (second-grade self care was not measured) was associated with negative academic and social development in sixth grade. Children who experienced more self care during the primary grades received lower grades, lower achievement test scores, and lower teacher ratings of social competence in sixth grade than did children who experienced less than three hours of self care per week in first or third grade.

Deborah Lowe Vandell and Jill Posner followed 216 low-income urban children living in a Midwestern industrial city from third grade through fifth grade and examined the adjustment of the children by the children's age and the type of self care children experienced. They found that the amount of time children spent alone in third grade predicted children's behavior problems in both third and fifth grade. However, the amount of time alone in fifth grade did not predict subsequent behavior problems.

Posner and Vandell also investigated the effect of unsupervised time with peers. The amount of unsupervised time children spent with peers predicted behavior problems at home and school as well as lower academic functioning. Like Posner and Vandell, Michele Goyette-Ewing investigated the association between types of self care and developmental consequences. She studied the after-school experiences of suburban seventh graders. Those unsupervised children who were "hanging out" with peers

were more likely to report behavior problems, alcohol use, susceptibility to negative peer pressure, and lower school achievement than were children who were at home alone or with siblings. Laurence Steinberg found that, among unsupervised middle school students, those who hung out with peers at malls and other public locations were more susceptible to peer pressure than the students who were at a friend's house or at home. Another study of sixth graders conducted by Nancy Galambos and Jennifer Maggs found that girls who hung out with peers after school were more likely to report engaging in problem behaviors than were boys who hung out with peers after school. Taken together, these studies suggest that unsupervised time with peers is detrimental to both the academic and behavioral adjustment of children throughout elementary and middle school.

The amount of time young adolescents spend in self care has been related to their academic, behavioral, and social emotional functioning. The Michigan Middle Start study included 46,000 young adolescents who reported how often and how many hours they were without adult supervision after school. The researchers found that the amount of self care each day mattered a great deal in predicting outcomes. Those young adolescents who experienced self care for less than three hours at a time did not differ from young adolescents who were supervised at all times on depression, self-esteem, behavior problems, or academic success. However, young adolescents who were in self care more than three hours at a time had dramatically lower adjustment scores on all measures when compared to young adolescents who experienced less than three hours of self care. A study of middle school students by Peter Mulhall and his colleagues found that young adolescents in self care more than two days per week used alcohol far more often than young adolescents who were always supervised by an adult after school. Those young adolescents who were not monitored two or more days per week got drunk after school four times more often than their supervised peers. Yet another study, by researchers in Southern California, found that those young adolescents who were unsupervised more than eleven hours per week were truant from school 1.5 times more often than young adolescents who were not unsupervised after school. Researchers who analyzed data from the National Educational Longitudinal Study (NELS) of 1988, a large nationally representative sample of more than 20,000 eighth-grade students, examined associations

between amount of self care and the academic performance and after school activities of those students. Those eighth graders who were unsupervised for more than one hour at a time had lower academic achievement than students who were supervised more often.

One reason that self care might contribute to problematic development is that there are limited activities available for children when they are home alone. For example, the NELS study found that television watching was related to the amount of self care such that more hours spent unsupervised after school predicted more hours of television watching. Television watching has been related to self care in several other studies, as well. There have been many studies on the consequences of watching television for children's academic achievement and aggression. In her longitudinal qualitative study of children in Boston, Deborah Belle found that the children were more likely to be lonely, bored, afraid, and unengaged in productive activities during the time they spent in self care than when supervised. Those negative feelings might be related to rules parents establish for safety purposes such as requiring children to stay in the house alone.

Family and neighborhood characteristics have been related to whether self care is problematic for children. Self care has been associated consistently with problematic adjustment among children who live in distressed circumstances such as low-income families and dangerous inner city neighborhoods. However, self care has not been shown to be detrimental to the development of children from middle class families who live in rural or suburban communities. The Child Development Project investigated associations between self care during first grade and developmental outcomes in sixth grade. The researchers found that the relationships between first-grade self care and sixth-grade externalizing behavior problems (aggression and delinquency) as reported by their teachers (who used a standardized checklist of behavior problems) were more pronounced for children from low-income families than for children from middle-income families. Nancy Marshall and her colleagues studied the after school arrangements of 206 urban first- through fourth-grade children in a multiracial sample in Boston. The children's families ranged in socioeconomic status from low to middle income. The researchers asked parents to report about their children's externalizing and internalizing behavior problems using

scales developed for that purpose. Externalizing behavior problems were measured by parent reports about the conduct disorders, restlessness, disorganization, and hyperactivity of the children; internalizing behavior problems were measured by parent report about the anxiety-shyness and psychosomatic symptoms of the children. Time spent in self care was associated with externalizing behavior problems for the children from lower but not middle income families. Internalizing problems were not related to self care among children from either lower- or middle-income families.

In cross-cultural studies of children conducted in traditional societies, some anthropologists have described developmental benefits for children who care for younger siblings. There have been few investigations of possible developmental benefits of self care in the United States. Goyette-Ewing did investigate that question and failed to find any developmental benefits associated with self care. Self-care children were not found to be more competent or mature than their counterparts who were supervised.

In conclusion, the developmental impact of self care appears to depend on the circumstances. Research findings suggests that child characteristics, type and amount of self care, and family circumstances are factors in the outcomes of self care. Younger children and children who were experiencing behavior problems before self care began appear to be more adversely affected by it. Children and young adolescents who hang out with peers and who spend long amounts of time unsupervised also seem to experience more negative outcomes than other children. Children from low-income urban families also appear to be at greater risk from self care.

LEE SHUMOW

## LATIN AMERICA AND THE CARIBBEAN

---

Countries in Latin America and the Caribbean (LAC) that are undergoing (or expecting to undergo) rapid economic growth are in need of better-trained workers, but the education system in these countries is still far behind the developed world. Latin American nations have tried hard to advance toward universal education and to increase enrollments in secondary and higher education, but they have not been able to improve the quality levels. While universal coverage in primary education is close to being a reality, quality levels in primary and secondary education are rather low and unequally distributed. Higher education has also increased at a fast pace—25 percent of college-age individuals were enrolled in postsecondary institutions in 2001. However, the quality of the higher education faculty is poor, and there is a need for an effective agenda for action.

The 12 billion dollars invested in LAC nations in the 1990s, with the support of the World Bank (WB) and the Inter-American Development Bank (IADB), has been instrumental in providing universal access to primary education (showing that the region really wants to improve its education). The famous Jomteín meeting of 1990 generated the International Education for All program to be implemented in the 1990–2000 decade. A world meeting in Dakar in 2000 discussed a World Report, in which the Education for All evaluation for Latin America shows that 95 percent of each age group eventually enrolls in primary school, but only 33 percent gets some type of infant or preschool education. In addition, socioeconomic factors drastically reduce enrollment in secondary and higher education.

Comparative information on learning in the region—made available through the UNESCO Regional Office for Latin America and the Caribbean (OREALC) regional study on learning in third and fourth grades—shows that the average student in eleven Latin American countries answered about 50 percent of the questions of the UNESCO test correctly, compared to about 85 percent for Cuban students. The study also shows that student scores in rural areas are lower than in urban areas; capital-city scores are better than in smaller urban areas; and private-school scores are better than in public schools. The Third International Mathematics and Science Study (TIMSS 99) confirmed the OREALC findings by that eighth grade Chilean students had lower achievement levels than students in OECD-member countries.

### **Development Expectations and Quality Education**

Demands for better quality education in the LAC region are supported by a growing awareness of the role education played in successful economic changes in East Asia, as well as by recent research on the multiple impacts of education and international comparisons of educational achievement. The experience of East Asian nations has been widely commented on in the LAC region. Mass media and academic groups have noted that better education and reduced inequality contributed to economic growth in East Asia and how, in turn, economic growth contributed to investment in education. Mass media also paid attention to the World Economic Forum's World Competitiveness Report, which showed that the weakest aspect of LAC countries was related to their human resources. This was confirmed by a 2000 report on functional literacy published by the Organization for Economic Cooperation and Development (OECD).

The International Adult Literacy Survey (ILAS) carried out by OECD in 2000 showed that 80 percent of Chilean workers were not able to perform at the minimum levels required to participate in the labor market of a developed country. Given that Chilean students perform above the regional average, the ILAS report confirmed the need to raise the quality of all levels of education. In spite of the low quality of education, the rates of return obtained on the amount of money invested in one additional school year generated by salaries (before the economic crisis of the late 1990s) were near 20 percent for primary

and secondary education and more than 10 percent for higher education. In spite of these important incentives for general training, market salaries have not provided enough incentives for further technical training.

### **Universal Education**

Since the 1960s remarkable progress has been made in LAC countries in expanding access to education and increasing the number of days students attend per year. However little has changed in most classroom processes (e.g., group work, reading and discussion, interviews, visits, formative evaluation, types of questions), and "scores on national and international exams are alarmingly low," according to Partnership for Educational Revitalization in the Americas. More children than ever are involved in the educational system, and access to basic education is almost universal. Primary school access jumped from 60 percent in the early 1960s to more than 90 percent in the 1990s, with enrollment for nine-year-olds close to 95 percent.

In the early twenty-first century, more than two-thirds of eligible children attend secondary school. In addition, between 1960 and 1990, higher education enrollment ratios increased from 6 percent to 25 percent in LAC nations. However, while several countries have established a comprehensive structure for advanced training, the actual research produced by universities has had very little impact on the economies of these countries.

Scholastic productivity is low in LAC nations. Students attend, on average, more than six years of schooling, but students generally pass only four grades. Income inequality has not been a constraint for enrolling in primary education, but it has played a role in the ability to achieve minimal levels of learning and enrollment in secondary education. The majority of public schools have not been able to deliver adequate education on a sustained basis, and research productivity is low in Latin American universities. On the other hand, there are enough successful education projects to suggest that effective reform can be implemented.

### **Quality of Education**

In spite of the expansion of student enrollments and multiple reform attempts, both the quality and relevance of the education that students receive are inadequate in most countries of the region. In addition to lineal expansion (more of the same educational

policies and methods), countries have: (1) enacted curricular reforms and constitutional provisions for minimum budgets or free education; (2) launched educational radio and TV programs and adult literacy campaigns; (3) organized nuclear groupings of schools and created comprehensive secondary schools; (4) instituted on-the-job training of teachers; (5) decentralized decisions and changed administrative structures; and (6) launched testing programs. However, the testing programs have shown that students are learning at roughly half the expected levels (those achieved by students in good private schools), and that only half of the students in the fourth grade are able to understand what they read. Furthermore, only in the elite private schools do students perform close to the average of students in developed countries. International comparisons carried out by the International Association for the Evaluation of Educational Achievement (IEA) show that cognitive achievement in Trinidad and Tobago and Venezuela—which are representative of the best systems in the LAC region—is closer to the levels of Africa than East Asia. In addition, there are serious equity problems. Even in the case of Chile, which has improved most inputs (e.g., teacher time, books, rooms, libraries, remedial training, buses, food) and effectively implemented structural reforms, achievement scores remained constant between 1982 and 2000 for every socioeconomic group.

As detected in the IEA study, achievement scores of students in marginal urban public schools and in rural primary schools (especially among indigenous populations) are usually equivalent to half the scores of wealthy students. Poor public schools also have a shorter school year and daily schedule, which, in many cases, give students less than 800 hours per year of potential learning opportunities (compared with 1200 or more hours offered to students in good private schools, a figure close to the average in developed countries). This limited amount of time for learning is usually due to using public school space in double shifts, and to a lack of teachers' time, even though this is mainly related to poor allocation of the public teaching staff in countries with a student/teacher ratio below thirty to one. In poor schools, a substantial amount of the time available for learning is, in fact, wasted in unproductive activities such as silence (discipline), roll call, and disruptions.

### Possible Causes of the Low Quality of Education

These poor regional results seem to be linked to the lack of formal evaluations of most of the implemented projects, and to poor professional review of the strategies included in each project. Most of these educational investments were made on the basis of untested or partially tested assumptions about the cost-effectiveness of particular interventions. This is because current knowledge about cost-effectiveness in education is extraordinarily inadequate, especially considering the amount of money that goes into education. In fact, education projects implemented in this region in the 1990s did not include the three highest cost-effective strategies suggested by a group of ten world experts (M. Carnoy and H. Levin, Stanford; N. McGinn and F. Reimers, Harvard; C. Moura Castro, Inter-American Development Bank; S. Heyneman, H. Martinez, and E. Velez, World Bank; J. Velez, PREAL; and J.C. Tedesco, UNESCO). According to their estimations, countries should start by undertaking interventions that do not cost much but do have an impact. For example, the best teacher should be assigned to the first grade in order to help students to learn to read as well as possible (this is particularly relevant in Latin America, where there is such a poor reading and writing record). These experts also highlighted the need for students to have enough time to learn, and they suggest that the official length of school year should be enforced. The third priority was given to a policy not to switch the classroom teacher during the year. It appears that not a single project undertaken during the 1990s in LAC countries supported these strategies.

It is also puzzling that the approaches and methodologies used in a successful Colombian program, *Escuela Nueva*, have not been adapted in education projects designed to develop basic education in other Latin American countries. In spite of being one of the few programs successfully evaluated in the region, it has only been used by the U.S. Agency for International Development (USAID) to improve primary education in Guatemala and Nicaragua.

Above all, the poor quality of the public education system in LAC countries is linked to a vicious circle, perpetuated by complex social factors resistant to reform. Few high school graduates are interested in a teaching career, as low salary levels and poor student achievement levels have created a low level of professional satisfaction. Therefore, most teachers select the profession not due to its intrinsic interest, but because they are not accepted in more

prestigious careers. The difference between the required and actual levels of training tends to raise demands for salaries because all teachers assume they meet the required standards. There are, in fact, no effective methods for assessing the individual ability of teachers. Salary demands are also affected by gender and by time schedules. More than two-thirds of all teachers are female, and all teachers have a part-time schedule, but the expected salary level is the salary of a full-time male teacher.

The problem in the public system is more serious because the best teachers tend to move to good private schools, where salaries may be five times higher than in the public system. Thus, there is continuous pressure for better salaries in the public sector. The pressure also involves annual strikes, because public school teachers make up a large share of the civil servants, which are organized in powerful unions and backed by congress members and political leaders. In addition, some teachers are leading local figures who play a critical role in elections. Even though salaries have not increased, strikes have eroded achievements levels and unions have not tried to improve teaching methods.

Most teachers use a *frontal*, or *whole-class*, teaching method, neglecting the needs of individual learners and distorting key educational objectives. Some 80 percent of Chilean secondary school teachers dictate their classes to students. Furthermore, frontal teaching implies an acceptance of an authoritarian teaching structure, the need to learn by rote, a single correct answer (and no opportunity to discuss divergent answers), lack of peer group discussion, and failure to link teaching with the local context.

There is consensus that improving primary and secondary education requires better educated teachers, but change strategies cannot rely on additional voluntary time spent by teachers or recruitment of better trained replacements. Since most teachers in these countries have poor training (there are few “good” teachers available for hire), teachers must be upgraded and provided with relevant tools such as learning guides. In addition, to get an extra effort from present teachers they must be paid more (e.g., one extra hour per day would increase the total cost by 20 to 25 percent). These tough conditions have been fulfilled in only a few successful projects. In these cases, suitable textbooks have played a key role in helping teachers to complement frontal teaching with other teaching models that support an active

role for students. However, evaluations of textbooks in several countries have shown that they: (1) do not suggest activities that students should carry out to grasp the main concepts; (2) contain no instructions for effective group work; (3) present no options for the student to make decisions about how to engage in the learning experience; (4) give few instructions for writing conclusions or reporting the work carried out; (5) do not include activities to be carried out with the family; and (6) provide limited opportunity (in the book) for students to self-evaluate their work. Usage of traditional books is constrained by the inability of teachers to change the predominant frontal teaching method used during their training.

### Teacher Training

Basic inputs are a required condition for learning, but they are not the only required condition. Without basic inputs, little learning may occur, but basic inputs do not necessarily generate expected achievement levels. Key inputs include classroom activities, the amount of time available for learning, materials for students to carry out their work (paper, pencils, learning guides and textbooks, and computers), and, of course, buildings. In addition, food and health programs are important, especially for deprived students. However, provision of these (and other) basic inputs does not guarantee that learning will improve, as observed in Chile. On the other hand, multigrade teaching without learning guides—learning materials with clear instructions for the students and teacher to generate an interesting learning experience—will be a failure. Without these guides, which complement the learning process, learning will be drastically reduced.

Even in LAC countries where more time, computers, and learning materials have been provided, no improvements have been measured, mostly due to the traditional frontal teaching style. Forty percent of students repeat the first grade, a fact that can only be explained in terms of poor teaching techniques. Lack of student discussions, learning tasks that are not related to context or expectations, few opportunities for composition writing, and lack of formative evaluation of students’ writing and homework are all related to the lack of suitable training of teachers. In fact, it has been determined that while most training institutions provide theoretical training (e.g., structural grammar, linguistic, or learning models), they do not train teachers with specific

strategies for teaching. In LAC countries, “teachers are poorly trained, poorly managed, and poorly paid. Superior teaching is seldom recognized, supported, or rewarded” according to Partnership for Educational Revitalization in the Americas. The training of future teachers is not likely to change as long as those doing the training continue using the frontal techniques now prevalent in teacher training institutions.

### Effects of Higher Education

Higher education has expanded the supply of teachers (mainly through private programs) and increased tuitions in professional careers, but less than one-fifth of the faculty has training in doctoral programs. Net enrollment rates of those between eighteen and twenty-two years of age increased from less than 4 percent in 1960 to nearly 25 percent in the late 1990s. Unfortunately, this rapid expansion of undergraduate enrollment was not preceded by an increase in graduate training. Therefore, graduates from undergraduate programs (those training for professional careers) were recruited to fill the additional higher education faculty positions.

Poor training in secondary education and professional careers starting in the first year of postsecondary studies are linked to high dropout and repetition rates in the first years of higher education, and to transfers to other programs. Some universities are trying out one or two years of college (similar to community colleges in the United States) to reduce the wastage of time and tuitions and the high levels of disappointment and rage found among the student population.

Master’s degree programs in certain areas, particularly those sought by private business, are being offered by joint ventures of local and foreign universities. Some distance education or visiting professors are usually included in the training packages. The Technological Institute of Monterrey (Mexico) is one of the leading institutions in this area, and has students all over Latin America. But improving the quality of the higher-education staff requires doctoral training linked with research. During the 1990s less than 20 percent of the higher education faculty had completed training in doctoral programs. Furthermore, there are few doctoral programs available for academic personnel willing to improve their training; salaries do not provide incentives for faculty with doctoral degrees; almost no scholarships are available for potential candidates; and few research

grants are available for preparing the doctoral thesis required for graduating. However, some advances were made in the 1990s in the allocation of research grants.

### Lack of Relevant Research

UNESCO and the OAS recommend that financing of research should be increased to reach at least 1 percent of gross domestic product (GDP), which for many LAC countries would be a twofold increase. In the past, the additional funds provided to universities were not channeled to research, but to many competing objectives. Therefore, present trends to allocate grants through competitive research contests should be reinforced, and contributions by private business (with some reduction in taxes) should be explored in order to link research activities with the problems faced by the private sector.

In some areas more public support seems to be required. For example not enough time has been devoted to identifying, understanding, and defining key educational problems, especially those that happen at the classroom level in primary and secondary education and those related to the development of a tradition of empirical research at the university level. Conventional wisdom has prevailed, however, and too much time has been spent in addressing irrelevant problems (e.g., class size, outdated curricula, labs, and libraries). According to research findings (for example, Gene Glass), class size is not related to achievement. Labs have been provided in most LAC countries through loans, but most of them are used as regular classrooms. Libraries are not used in primary and secondary education. All these elements are used when teachers have been trained in a different way. There is a lack of analysis of the real nature and causes of the poor quality of education observed in LAC countries, and of the probable effects of reforms (in most cases reform means gradual, complex changes, rather than drastic simple changes). Even though everything seems to have been tried in LAC education, the effective fight for quality reform has yet to start.

### Lack of Relevant Incentives

The staffs of ministries of education and of development cooperation agencies (and their children) are enrolled in private schools—they do not use the public schools they are managing and thus are not affected by the classroom impact of their projects, nor are their professional careers. They therefore

have limited incentives for searching out better strategies to improve the performance of the education system. Fortunately, personal commitment often compensates for this lack of built-in incentives.

The learning process is affected by the gap between the educational background of decision makers and the education delivered to students in rural areas or in urban marginal schools of developing countries. The gap is so wide that policymakers or lending and project officials have problems understanding the key elements of the educational development process. Furthermore, these leaders, who enroll their children in private schools, are not going to be affected by the final outcomes of the recommended strategies or projects, so the effort spent in the design of good education projects only depends on their personal values and commitment. The lack of incentives for educational leaders to do their utmost to achieve success with their policies seems to be sadly reflected in poor educational outcomes.

The lack of evaluation of the impact of projects in students' achievement (and, ideally, in the personal development of students) and the lack of good estimations of the cost-effectiveness of specific strategies, constrain professional judgment and tend to support old approaches focused on traditional goals or on timely implementation of disbursements. Therefore, progress in a teacher's professional career is not related to student improvement. Educational policies have thus been detached from improvement of human resources in the LAC region.

## LATIN IN SCHOOLS, TEACHING OF

---

Since it was first instituted as a formal course of study—first for Roman children, and then for members of the ever-expanding Roman Empire—Latin has been a staple of formal curricula. And for almost all of that time, controversy has swirled around the methodologies that should be used to teach Latin, its precise role in the curricula, and the aims and goals of teaching Latin. As the arguments and counterarguments have evolved, definite (and cyclical) trends have emerged.

### Enrollments

At the turn of the twentieth century, more than 50 percent of the public secondary-school students in the United States were studying Latin. Until 1928 Latin enrollments in U.S. secondary schools were greater than enrollments in all other foreign languages combined, and in the mid-1930s the number of Latin students rose to 899,000. This is not surprising, since Latin was commonly required for admission to college and was seen as the mark of an educated individual. Latin continued to be the front-runner for about another twenty years, until Spanish took the lead. Still, over the next ten years, Latin enrollments generally kept pace, rising 46 percent, compared to 56 percent for Spanish and 90 percent for French. Despite a sudden postwar drop in Latin studies (the number of students fell to about 429,000), Latin was fairly secure in the curriculum, and the numbers grew steadily thereafter.

In 1958 in response to a national concern in the United States over the nation's global status in mathematics and science, Congress passed the National Defense Education Act, which omitted support for all Latin, except at the graduate level. Latin soon began a gradual decline, though it retained much of its old cachet. This would soon change, however. In

1962 there were 702,000 students enrolled in Latin classes in U.S. secondary schools. By 1976 the number had dropped 79 percent, to 150,000, largely due to pressure for more relevant and elective courses at all education levels. The classics profession began a swift counteroffensive, and by 1978 enrollments were on the rise once more. More recent data suggest a slight leveling off at grades nine through twelve, with a total enrollment of 188,833 students in 1994, representing some 1.6 percent of the total enrolled population. New growth areas include middle-school Latin, with more than 25,349 enrolled in grades seven and eight, and 4,265 elementary students of Latin.

At the college level, the overall number of Latin students has changed less dramatically, with 39,600 reported in 1965 and 25,897 in 1995. But given the surge in college enrollments, this represents a percentage drop from .669 percent in 1965 to only .180 percent in 1995. While hard data are not readily available, it is fair to say that the 1980s and 1990s saw a definite decline in traditional classics majors (concentrating in Latin and Greek language study) and an increasing move toward those minoring, and majoring, in classical civilization or classical studies, a curriculum that demands only the rudimentary study of the actual languages. As a result, while K–12 Latin enrollments have increased slightly, an aging population of Latin teachers is facing retirement, with an inadequate number of qualified teachers available to take their place.

Latin is also taught at the junior college level, but with no regularity. Here also, courses in classical civilization, history, and mythology are far more common than the actual study of the languages themselves. It is also worth noting that Latin retained its special status in countries such as England and Germany far longer than it did in the United States. But recent curricular reforms in these countries have put Latin at risk there as well.

### Teaching Methods and Textbooks

Few methodologies have been both as traditional and as innovative as those associated with Latin. For the Romans themselves, the goal of learning Latin was totally utilitarian—to learn, as Quintilian put it, “the ability to speak Latin properly and to elucidate the poets” (*recte loquendi scientiam et poetarum enarrationem*) (Marrou, p. 274). In its higher forms, of course, it aimed at the proper use of the language in the fine art of rhetoric, for the way to success in the

Roman world was through the effective use of oratory. What we know of the way in which Romans taught their children Latin would not stand the scrutiny of twenty-first-century educational theorists for very long, for there was a heavy emphasis on rote memorization and corporal punishment. Once the students had the rudiments down, they moved on to the grammar school, where, from roughly age six through age twelve, they began the acquisition of Latin grammar under the tutelage of the appropriately named *grammaticus*. Historian Henri Marrou carefully defines the subject matter as a dull analysis of each word in a text from as many perspectives as possible.

But the ultimate goal of Roman education was the *enarratio poetarum*, and to this day most claim that the sole aim of studying Latin is to acquire a proper appreciation of the Latin classics. Roman students were expected to be able to read, aloud and with expression, a given passage from the works of a poet. Then they were grilled, line by line and word by word, on the many intricacies of the grammar, rhetorical figures, and mythological allusions. Advanced students went on to rhetorical studies to prepare them for public life.

In the Middle Ages Latin continued to be taught as a living tongue. Though no country had Latin as its language, the ability to speak, read, and write Latin was still essential for advancement in church or state circles. Thus, in the elementary schools, “the chief objective and emphasis of teachers and pupils was the ability to speak Latin with ease. Success in this almost automatically entailed ability to read and write it as well” (Ganss, p. 122). A well-written survey of teaching methods, some of them rather innovative, remains to be written for this and subsequent periods.

Much has been made about the emphasis on the study of Latin and Greek in early America. To be sure, any educated American needed Latin and Greek to enter college, but Latin was commonly charged with being irrelevant, poorly taught, and dull. Throughout the nineteenth century, and until 1924, the *grammar/translation* method held sway. In this method the grammar was laid out in orderly charts for the student to memorize. Only after endings and forms were memorized and usage had been thoroughly explained was the new material to be applied to practice sentences and, finally, to translation from the Latin. This method traditionally exposed the student to all the basic grammar in Latin in one

year. The second year was traditionally given over to reading Caesar, the third to Cicero, and the fourth to Virgil. In these courses the emphasis was on accurate translation and meticulous grammatical explanation of the text. Under this methodology, it was found that in the mid-1920s only about 30 percent of students continued beyond the second year, and only 15 percent beyond the third. In 1924 the American Classical League commissioned a study of the teaching of Latin. The so-called Advisory Committee published its *Classical Investigation*, in which it recommended some forward-thinking reforms for Latin teaching, such as adding cultural materials to be read in English, a change from the traditional grammar/translation paradigm (and a move to have students read Latin more naturally as Latin), and the inclusion of other authors in the curriculum. The report was farsighted, but largely ignored. As Judith Sebesta has shown, textbooks remained essentially unchanged until well after the sharp decline in enrollments of the 1960s and 1970s. Several of these grammar/translation texts are still in use in the early twenty-first century (e.g., Wheelock, Jenney) and other, newer texts, still follow their essential format (e.g., Goldman and Nyenhuis, Johnson).

A major break with this tradition was in response to the theories of behaviorism and structural linguistics, which led to Waldo Sweet's text based on *programmed learning*, where the student is allowed to acquire forms at the student's own pace. Glenn Knudsvig's *Latin for Reading* (1986) was influenced by Sweet and relied heavily on linguistic theory to help the student learn how to read Latin in a less rigid and more flowing fashion.

Cognitive psychology and the theories of Noam Chomsky led to the creation of a series of textbooks generally referred to as *reading method* texts. These texts have as their main goal enabling students to read extensive passages in Latin with relative ease. They are marked by their lack of formal grammar explication, use of stories with a connected plot written for the volumes, little if any use of authentic texts in the earlier volumes, and a reliance on illustrations to help students grasp new concepts. Only after a student has seen a new construction used several times is the construction explained. These textbooks are widely used at all levels today, and similar textbooks have been created for special use at the elementary and middle school levels.

## Trends, Issues, and Controversies

Latin has made a remarkable comeback in U.S. schools at the start of the twenty-first century. In many districts it ranks as the second most popular language—second only to Spanish. Yet the continued presence of Latin in K–12 curricula depends on the profession's prompt attention to many different forces at work in education. The first problem is a direct result of the profession's aggressive promotion of Latin in the face of the dramatic decline in Latin study during the 1960s and 1970s. The United States is facing an increasingly severe shortage of Latin teachers. Many school districts drop Latin programs each year for lack of teachers, and each year the standard placement services show many more openings for Latin teachers than job applicants.

The placement services also show an increasing call for Latin teachers who can teach one other language, most commonly Spanish. Since Spanish is closely related to Latin it represents a natural alliance that has had great success in pilot programs combining the two languages. Further, as Latin continues to expand at the elementary and middle school levels, the field will be increasingly called upon to devise further curricula and materials suitable for these levels.

Many national initiatives have influenced Latin in the K–12 curriculum. For example, both block scheduling and the International Baccalaureate (which initially did not accommodate the study of Latin) have, over recent years, caused Latin professionals once more both to mount proactive campaigns and to modify outdated teaching methodologies. Such change is facilitated by alliances between such national groups as The American Classical League (ACL; traditionally a K–12 organization) and the American Philological Association (APA; traditionally a college and university organization). As such alliances increase, insularity among Latin teacher groups is becoming a thing of the past. Likewise, the national classics organizations have increasingly allied themselves with modern language groups such as The American Council for the Teaching of Foreign Languages (ACTFL) and the Modern Language Association (MLA). As a result, Latin is routinely included whenever issues affecting all languages are discussed.

This was never more evident than in the matter of the national standards movement. The resurgence of Latin occurred along several tracks at once, with

markedly different goals and target audiences. The profession first took note of the disparity among curricula in the late 1980s and early 1990s. This insight was spurred on by ACTFL's *Standards for Foreign Language Learning: Preparing for the Twenty-First Century* and a broad coalition of classicists from all levels gathered to produce *Standards for Classical Language Learning*, which was jointly published by the ACL and APA and has become the accepted standard in its field.

The future of Latin in the schools is somewhat unclear at present. The president of a major state university, looking back at the "good old days" put it well: "I do not know, of course, what is to become of classical study in this country, but personally I should regard it as a great blow to the development of some of the finest and most important sides of American life if the study of Greek and Latin should fall to the relatively unimportant place now occupied by the study of Assyrian and Babylonian, as some people think it is bound to do" (West, p. 188). This nervous statement, however, was made in 1917 by Edmund J. James of the University of Illinois. The study of Latin, it seems, will always have its challenges, and its doubters, but if the past is any indication, it will rise to meet the future as well as it has the past.

## LAW EDUCATION

The law deals with all aspects of human life in its individual and collective expression, searching for economic and social justice, addressing past injustice, and ruling on divisive issues. As dynamic as the society it represents, the law changes as the zeitgeist or spirit of the times reflects emerging interests and concerns. Those interested in a career in law will find it a route to understanding American culture in all its dimensions.

A career in law requires dedication, persistence, and the analytical skills that are essential for interpreting past and current legal decisions. Liberal arts undergraduate programs or degree programs that have a concentration on critical thinking skills, along with a number of advanced courses—such as logic, English literature, foreign language, business and/or education law, sociology, and philosophy—prepare students for law school. Pre-law school advisers are available on campuses to assist students in planning for a career in law and choosing law schools. Mentoring services are available in most law schools.

Each law school has its own unique culture and admissions process. Although law schools differ in many aspects, a common goal is training well-qualified graduates to represent the highest ideals of the profession in practice. Prospective students are encouraged to review the specifics of individual law school policies and procedures through campus visits and/or websites that are comprehensive and detailed. All law schools now have websites with information about admissions processes.

## Criteria for Admission to Law School

Law schools are highly competitive and selective, and there is a wide range of criteria used for admissions. Students can find a law school whose admissions acceptance rates meet their individual profiles.

Although some law schools admit students from the third year of undergraduate studies, most require a bachelor's degree. Since applying to law schools is a time-consuming and costly process, students are encouraged to use a centralized processing agency (Law School Data Assembly Service, or LSDAS), which for a fee will assist them in preparing multiple applications. Law school admission review boards examine a student's GPA (grade point average), Law School Admission Test (LSAT) score, plus a variety of other factors including extracurricular experiences such as leadership activities, debate clubs, foreign language, and travel. A student's résumé should include volunteer service, work experience, and extracurricular activities together with the LSAT test score, also a personal statement about long-term and short-term goals, reasons for choosing law as a profession, and any other information that candidates wish to share. Three or four personal recommendations should be included. It is very important to carefully proofread materials submitted to assure accuracy and grammatical correctness. Admissions offices are inundated with applications; those not correctly filled out may be discarded.

There is no specific formula for admission to law school beyond a good academic record and LSAT score, along with experiences that show a commitment toward community improvement. Students who have low grades in first-year undergraduate courses but who show marked improvement in later studies demonstrate improved achievement and often the review committee will review these applicants favorably. Students need to apply to several law schools to ensure their admission. Applications a year or a year and half before matriculation dates are advised, except for students transferring from other law schools at home or abroad, who should apply earlier than regular law students. Law school admissions officers must receive letters of good standing from previous law schools. Law schools differ in the time frame but applying for the fall term should take place from October through February.

Law schools are interested in having a faculty and student body representative of the larger society.

To ensure ethnic and cultural diversity in enrollment the Council on Legal Education Opportunity, the Association of American Law Schools, the National Bar Association, and the American Bar Association (ABA) support special programs, mentors, individual and group tutors, and remedial courses in reading, writing, and grammar together with practice examinations. In addition, efforts to fund students' tuition costs based on financial need are continuing.

The American Bar Association's list of approved schools provides detailed information about a number of factors important to review prior to submitting applications. Some of these include the credentials of part-time and full-time law school faculty, percentages of dropouts through the three or four years, advanced and joint degree offerings, professional associations program approval, library and special facilities, gender and minority enrollment statistics, costs including available grants, loans, job assistance for spouses, and availability of housing and costs.

### Applying to Law School

Students interested in applying to a law school should engage in networking to learn about the school's culture, history, and curriculum. It is helpful to contact current and former students to discuss the admission process as well as to learn about the campus, instructional methods, competitive ranking, and the quality of students, faculty, and administrators. Applying to three or four law schools can give students a range of options from highly competitive institutions with international reputations to "safe schools," or those that have a broader range of admissions acceptance. Study guides and tutorial programs are available to aid in preparation for the LSAT, which is a multiple-choice test given four times a year at strategic sites throughout the country. The Law School Admission Council offers publications such as *The Right Law School for You* and *Financing Your Law School Education*.

### Curriculum and Degrees

Full time students are expected to complete a three-year program, while part-time students often take four or more years for completion. Both full-time and part-time students complete their degree more quickly by taking summer school courses. The first year of law school is the most challenging, with the greatest dropout rate. Law schools with the fewest

dropouts have very selective admissions processes. Although there are a number of students who drop out at the second year, generally most students who complete the first year of law school complete the degree requirements. Few drop out in the third and fourth year of law school.

A typical first-year law school curriculum includes contracts, criminal law, constitutional law, civil procedure, civil law, property, and torts. Second and third year courses offer students a variety of concentrations such as business and tax law, commercial law, constitutional law, labor and employment law, civil liberties and civil rights, and environmental law. Generally there is no formal second and third year curriculum, but some law schools require legal research and writing courses.

There are a variety of law degrees, including the most common J.D. (Juris doctor), LL.M (Master of Laws), and S.J.D. (Doctor of Juridical Science). Joint degrees are available, including the J.D./M.B.A. (Master of Business Administration), J.D./M.Ed. (Master of Education), and the J.D./Ph.D. (Doctor of Philosophy). Non-ABA-accredited law degree programs offer J.D. degrees. They are often accredited by state agencies. In many states practicing lawyers are required to have graduated from an ABA-accredited school.

Online law schools are available for individuals who are place bound, those who enjoy studying at their own pace, or those who have other needs requiring flexibility in time and place. Online law programs provide unlimited access to faculty and law resources twenty-four hours per day, seven days per week. As in other professions, so in law, online degree programs with their nontraditional formats have challenged accreditation agencies. Accreditation of these programs will be under review as accrediting agencies work through the challenge of innovative, emerging models for legal education. Concord University, one of the first online law degree programs, is accredited by the Distance Education Learning Council and a Committee of Bar Examiners in California.

In a litigious society, well-prepared, well-qualified lawyers will continue to be in demand. Law provides a career well worth a prospective student's best efforts.

## LAW SCHOOL ADMISSION TEST

The Law School Admission Test (LSAT) is the half-day, standardized entrance exam required by the 198 law schools (184 in the United States and 15 in Canada) that constitute the membership of the Law School Admission Council (LSAC) as of July 2001. The LSAC, a nonprofit corporation located in Newton, Pennsylvania, is the sole administering body of the LSAT. The LSAT is administered to large groups of individuals four times per year (February, June, October, and December) at numerous test centers. Approximately 107,000 individuals took the LSAT in 2000.

### History

During the first half of the twentieth century the generic intelligence test and its various offspring gained popularity. The use of intelligence tests dur-

ing World War I by the U.S. military was followed quickly by the introduction in 1920 of the National Intelligence Test for American school children and in 1926 with the Scholastic Aptitude Test. The first LSAT was administered twenty-two years later in 1948. Although the methodology used to score the LSAT has undergone changes over time, the general format and substance of the LSAT has remained relatively constant.

### Format

The 2001 LSAT is representative of the contemporary examination. It consists of five multiple-choice sections of thirty-five minutes each and an additional, non-scored thirty-minute writing sample. Two of the test sections focus on logical reasoning by testing the ability of the test-taker to perceive logical fallacies in statements. Another section focuses on analytical reasoning skills by challenging the test-taker to solve complex puzzles based on systems of relationships. The final section is a high-level reading comprehension exercise that examines the individual's ability to digest complex passages of text and identify the author's purpose. An additional fifth experimental section may be any of the other three types and is used to pilot questions for future LSAT exams. The experimental section does not contribute to the individual's score.

### Scoring

The LSAT score reported for an individual is a *scaled score* that is generated using a mathematical conversion formula unique for each particular version of the exam. The *raw score*, on the other hand, is a direct representation of the number of test questions the individual answered correctly. With a total of approximately 101 questions on each LSAT, an individual receives a single raw point score for each correctly answered question. The raw score is then converted to a scaled score that falls between 120, the minimum LSAT score, and 180, the maximum LSAT score.

### Role of the LSAT in Legal Education

The LSAT is the primary vehicle through which individuals gain entrance to the system of legal education officially approved by the American Bar Association (ABA). The LSAT is analogous to the Medical College Admission Test (MCAT) and the Graduate Management Admission Test (GMAT); it is the standardized mechanism used by a profession-

al school in evaluating applicants for potential ability within the professional school setting and, thus, for possible entry into the profession itself. The impact of the LSAT as the gatekeeper to the legal profession cannot be overstated.

The LSAT is used to make important decisions about the path of law school applicants' lives. It seems unavoidable under these circumstances that the test itself has become a source of ongoing controversy. Questions persist as to whether the LSAT measures the ability to succeed in the modern law school and as to the proper weight to give to LSAT scores during the admissions process. Accordingly, criticisms abound regarding a number of aspects of the LSAT.

The LSAT score is the most heavily weighted criteria considered by those involved in the law school admissions decision-making process. The most common criticism associated with the process is that those making the admissions decisions rely on LSAT scores as an obvious indicator of those who will succeed in law school. Critics argue that the LSAT is not conclusive in its predictive ability of academic performance in law school. They point out the impact of other factors, including support systems, financial demands, and individual motivation, as important in determining the long-term success of a student in law school. The Law School Admission Council itself, however, has always urged law school admissions professionals to resist the urge to make the LSAT score the sole criteria used in the admissions process.

Concerns about the validity of the LSAT bring serious issues of fairness and equity into the dialogue concerning the law school admissions process. The debate surrounding gender, racial, and ethnic bias in the LSAT system generates the majority of the academic literature about the test and supports a flow of legal cases over admissions decisions. Various studies have offered data suggesting that the LSAT serves as a barrier to the admission of women and ethnic applicants into a professional system that has traditionally been dominated by white males. The underlying rationale for the use of the LSAT, however, is to avoid the biases that come with more arbitrary methods of selection. Standardized testing theoretically offers a mechanism for the selection of students based on academic ability rather than more subjective characteristics, such as social standing.

The predictive accuracy of the LSAT will remain under question. Logic demands continued and con-

scious attention to the standardized test that provides admittance to a modern legal education. Indeed, the baseline justification behind using the LSAT in the admission process is the assumption that the test is a strong predictor of performance during the first year of law school. Regardless of the various concerns regarding the test, the LSAT remains the best measure of academic ability developed to date to aid in the law school admissions process.

## ANALOGICAL REASONING

Analogy plays an important role in learning and instruction. As John Bransford, Jeffrey Franks, Nancy Vye, and Robert Sherwood noted in 1989, analogies can help students make connections between different concepts and transfer knowledge from a well-understood domain to one that is unfamiliar or not directly perceptual. For example, the circulatory system is often explained as being like a plumbing system, with the heart as pump.

### The Analogical Reasoning Process

Analogical reasoning involves several sub-processes: (1) retrieval of one case given another; (2) mapping between two cases in working memory; (3) evaluating the analogy and its inferences; and, sometimes, (4) abstracting the common structure. The core process in analogical reasoning is mapping. According to structure-mapping theory, developed by Dedre Gentner in 1982, an analogy is a mapping of knowledge from one domain (the base or source) into another (the target) such that a system of relations that holds among the base objects also holds among the target objects. In interpreting an analogy, people seek to put the objects of the base in one-to-one correspondence with the objects of the target so as to obtain the maximal structural match. The corre-

sponding objects in the base and target need not resemble each other; what is important is that they hold like roles in the matching relational structures. Thus, analogy provides a way to focus on relational commonalities independently of the objects in which those relations are embedded.

In explanatory analogy, a well-understood base or source situation is mapped to a target situation that is less familiar and/or less concrete. Once the two situations are aligned—that is, once the learner has established correspondences between them—then new inferences are derived by importing connected information from the base to the target. For example, in the analogy between blood circulation and plumbing, students might first align the known facts that the pump *causes water to flow through* the pipes with the fact that the heart *causes blood to flow through* the veins. Given this alignment of structure, the learner can carry over additional inferences: for example, that plaque in the veins forces the heart to work harder, just as narrow pipes require a pump to work harder.

Gentner and Phillip Wolff in 2000 set forth four ways in which comparing two analogs fosters learning. First, it can highlight common relations. For example, in processing the circulation/plumbing analogy, the focus is on the dynamics of circulation, and other normally salient knowledge—such as the red color of arteries and the blue color of veins—is suppressed. Second, it can lead to new inferences, as noted above. Third, comparing two analogs can reveal meaningful differences. For example, the circulation/plumbing analogy can bring out the difference that veins are flexible whereas pipes are rigid. In teaching by analogy, it is important to bring out such differences; otherwise students may miss them, leading them to make inappropriate inferences. Fourth, comparing two analogs can lead learners to form abstractions, as amplified below.

### What Makes a Good Analogy

As Gentner suggested in 1982, to facilitate making clear alignments and reasonable inferences, an analogy must be structurally consistent—that is, it should have one-to-one correspondences, and the relations in the two domains should have a parallel structure. For example, in the circulation/plumbing system analogy, the pump cannot correspond to both the veins and the heart. Another factor influencing the quality of an analogy is systematicity: Analogies that convey an interconnected system of

relations, such as the circulation/pumping analogy, are more useful than those that convey only a single isolated fact, such as “The brain looks like a walnut.” Further, as Keith Holyoak and Paul Thagard argued in 1995, an analogy should be goal-relevant in the current context.

In addition to the above general qualities, several further factors influence the success of an explanatory analogy, including base specificity, transparency, and scope. Base specificity is the degree to which the structure of the base domain is clearly understood. Transparency is the ease with which the correspondences can be seen. Transparency is increased by similarities between corresponding objects and is decreased by similarities between noncorresponding objects. For example, in 1986 Gentner and Cecile Toupin found that four- to six-year-old children succeeded in transferring a story to new characters when similar characters occupied similar roles (e.g., squirrel → chipmunk; trout → salmon), but they failed when the match was cross-mapped, with similar characters in different roles (e.g., squirrel → salmon; trout → chipmunk). The same pattern has been found with adults. Transparency also applies to relations. In 2001 Miriam Bassok found that students more easily aligned instances of “increase” when both were continuous (e.g., speed of a car and growth of a population) than when one was discrete (e.g., attendance at an annual event). Finally, scope refers to how widely applicable the analogy is.

### Methods Used to Investigate Analogical Learning

Much research on analogy in learning has been devoted to the effects of analogies on domain understanding. For example, in 1987 Brian Ross found that giving learners analogical examples to illustrate a probability principle facilitated their later use of the probability formula to solve other problems. In classroom studies from 1998, Daniel Schwartz and John Bransford found that generating distinctions between contrasting cases improved students’ subsequent learning. As reported in 1993, John Clement used a technique of bridging analogies to induce revision of faulty mental models. Learners were given a series of analogs, beginning with a very close match and moving gradually to a situation that exemplified the desired new model.

Another line of inquiry focuses on the spontaneous analogies people use as mental models of the world. This research generally begins with a ques-

tionnaire or interview to elicit the person’s own analogical models. For example, Willet Kempton in 1986 used interviews to uncover two common analogical models of home heating systems. In the (incorrect) valve model, the thermostat is like a faucet: It controls the rate at which the furnace produces heat. In the (correct) threshold model, the thermostat is like an oven: It simply controls the goal temperature, and the furnace runs at a constant rate. Kempton then examined household thermostat records and found patterns of thermostat settings corresponding to the two analogies. Some families constantly adjusted their thermostats from high to low temperatures, an expensive strategy that follows from the valve model. Others simply set their thermostat twice a day—low at night, higher by day, consistent with the threshold model.

### Analogy in Children

Research on the development of analogy shows a relational shift in focus from object commonalities to relational commonalities. This shift appears to result from gains in domain knowledge, as Gentner and Mary Jo Rattermann suggested in 1991, and perhaps from gains in processing capacity as suggested by Graeme Halford in 1993. In 1989 Ann Brown showed that young children’s success in analogical transfer tasks increased when the domains were familiar to them and they were given training in the relevant relations. For example, three-year-olds can transfer solutions across simple tasks involving familiar relations such as stacking and pulling, and six-year-olds can transfer more complex solutions. In 1987 Kayoko Inagaki and Giyoo Hatano studied spontaneous analogies in five- to six-year-old children by asking questions such as whether they could keep a baby rabbit small and cute forever. The children often made analogies to humans, such as “We cannot keep the baby the same size forever because he takes food. If he eats, he will become bigger and bigger and be an adult.” Children were more often correct when they used these personification analogies than when they did not. This suggests that children were using humans—a familiar, well-understood domain—as a base domain for reasoning about similar creatures.

### Retrieval of Analogs: The Inert Knowledge Problem

Learning from cases is often easier than learning principles directly. Despite its usefulness, however,

training with examples and cases often fails to lead to transfer, because people fail to retrieve potentially useful analogs. For example, Mary Gick and Holyoak found in 1980 that participants given an insight problem typically failed to solve it, even when they had just read a story with an analogous solution. Yet, when they were told to use the prior example, they were able to do so. This shows that the prior knowledge was not lost from memory; this failure to access prior structurally similar cases is, rather, an instance of “inert knowledge”—knowledge that is not accessed when needed.

One explanation for this failure of transfer is that people often encode cases in a situation-specific manner, so that later reminders occur only for highly similar cases. For example, in 1984 Ross gave people mathematical problems to study and later gave them new problems. Most of their later reminders were to examples that were similar only on the surface, irrespective of whether the principles matched. Experts in a domain are more likely than novices to retrieve structurally similar examples, but even experts retrieve some examples that are similar only on the surface. However, as demonstrated by Laura Novick in 1988, experts reject spurious reminders more quickly than do novices. Thus, especially for novices, there is an unfortunate dissociation: While accuracy of transfer depends critically on the degree of structural match, memory retrieval depends largely on surface similarity between objects and contexts.

### Analogical Encoding in Learning

In the late twentieth century, researchers began exploring a new technique, called analogical encoding, that can help overcome the inert knowledge problem. Instead of studying cases separately, learners are asked to compare analogous cases and describe their similarities. This fosters the formation of a common schema, which in turn facilitates transfer to a further problem. For example, in 1999 Jeffrey Loewenstein, Leigh Thompson, and Gentner found that graduate management students who compared two analogical cases were nearly three times more likely to transfer the common strategy into a subsequent negotiation task than were students who analyzed the same two cases separately.

### Implications for Education

Analogies can be of immense educational value. They permit rapid learning of a new domain by

transferring knowledge from a known domain, and they promote noticing and abstracting principles across domains. Analogies are most successful, however, if their pitfalls are understood. In analogical mapping, it is important to ensure that the base domain is understood well, that the correspondences are clear, and that differences and potentially incorrect inferences are clearly flagged. When teaching for transfer, it is important to recognize that learners tend to rely on surface features. One solution is to minimize surface features by using simple objects. Another is to induce analogical encoding by asking learners to explicitly compare cases. The better educators understand analogical processes, the better they can harness them for education.

## CAUSAL REASONING

A doorbell rings. A dog runs through a room. A seated man rises to his feet. A vase falls from a table and breaks. Why did the vase break? To answer this question, one must perceive and infer the causal relationships between the breaking of the vase and other events. Sometimes, the event most directly causally related to an effect is not immediately apparent (e.g., the dog hit the table), and conscious and effortful thought may be required to identify it. People routinely make such efforts because detecting causal connections among events helps them to make sense of the constantly changing flow of events. Causal reasoning enables people to find meaningful order in events that might otherwise appear random and chaotic, and causal understanding helps people to plan and predict the future. Thus, in 1980 the philosopher John Mackie described causal reasoning as “the cement of the universe.” How, then, does one decide which events are causally related? When does one engage in causal reasoning? How does the ability to think about cause–effect relations originate and develop during infancy and childhood? How can causal reasoning skills be promoted in educational settings, and does this promote learning? These questions represent important issues in research on causal reasoning

### Causal Perceptions and Causal Reasoning

An important distinction exists between causal perceptions and causal reasoning. Causal perceptions refer to one’s ability to sense a causal relationship without conscious and effortful thought. According to the philosopher David Hume (1711–1776), perceptual information regarding contiguity, precedence, and covariation underlies the understanding of causality. First, events that are temporally and spatially contiguous are perceived as causally related. Second, the causal precedes the effect. Third, events that regularly co-occur are seen as causally related. In contrast, causal reasoning requires a person to reason through a chain of events to infer the cause of that event. People most often engage in causal reasoning when they experience an event that is out of the ordinary. Thus, in some situations a person may not know the cause of an unusual event and must search for it, and in other situations must evaluate whether one known event was the cause of another. The first situation may present difficulty because the causal event may not be immediately apparent. Philosophers have argued that causal reasoning is based

on an assessment of criteria of necessity and sufficiency in these circumstances. A necessary cause is one that must be present for the effect to occur. Event A is necessary for event B if event B will not occur without event A. For example, the vase would not have broken if the dog had not hit the table. A cause is sufficient if its occurrence can by itself bring about the effect (i.e., whenever event A occurs, event B always follows). Often, more than one causal factor is present. In the case of multiple necessary causes, a set of causal factors taken together jointly produces an effect. In the case of multiple sufficient causes, multiple factors are present, any one of which by itself is sufficient to produce an effect.

### The Development of Causal Perception and Causal Reasoning Skills

Causal perception appears to begin during infancy. Between three and six months of age, infants respond differently to temporally and spatially contiguous events (e.g., one billiard ball contacting a second that begins to roll immediately) compared to events that lack contiguity (e.g., the second ball begins to roll without collision or does not start to move until half a second after collision). Thus, the psychologist Alan Leslie proposed in 1986 that infants begin life with an innate perceptual mechanism specialized to automatically detect cause–effect relations based on contiguity. However, psychologists Leslie Cohen and Lisa Oakes reported in 1993 that familiarity with role of a particular object in a causal sequence influence ten-month-old infants’ perception of causality. Therefore, they suggest that infants do not automatically perceive a causal connection when viewing contiguous events. The question of whether infants begin with an innate ability to automatically detect causality, or instead gradually develop casual perception through general learning processes remains a central controversy concerning the origins of causal thought.

Although infants perceive causal relationships, complex causal reasoning emerges during early childhood and grows in sophistication thereafter. Thus, information about precedence influences causal reasoning during childhood. When asked to determine what caused an event to occur, three-year-olds often choose an event that preceded it, rather than one that came later, but understanding of precedence becomes more consistent and general beginning at five years of age. Unlike contiguity and precedence, information about covariation is not

available from a single casual sequence, but requires repeated experience with the co-occurrence of a cause and effect. Children do not begin to use co-variation information consistently in their casual thinking before eight years of age. Because the various types of information relevant to causality do not always suggest the same causal relation, children and adults must decide which type of information is most important in a particular situation.

In addition to the perceptual cues identified by Hume, knowledge of specific causal mechanisms plays a central role in causal reasoning. By three years of age, children expect there to be some mechanism of transmission between cause and effect, and knowledge of possible mechanisms influences both children's and adults' interpretation of perceptual cues. For instance, when a possible causal mechanism requires time to produce an effect (e.g., a marble rolling down a lengthy tube before contacting another object), or transmits quickly across a distance (e.g., electrical wiring), children as young as five years of age are more likely to select causes that lack temporal spatial contiguity than would otherwise be the case. Because causal mechanisms differ for physical, social, and biological events, children must acquire distinct conceptual knowledge to understand causality in each of these domains. By three to four years of age, children recognize that whereas physical effects are caused by physical transmission, human action is motivated internally by mental states such as desires, beliefs, and intentions, and they begin to understand some properties of biological processes such as growth and heredity. Furthermore, conceptual understanding of specific causal mechanisms may vary across cultures and may be learned through social discourse as well as through direct experience.

A fundamental understanding of causality is present during early childhood; however, prior to adolescence children have difficulty searching for causal relations through systematic scientific experimentation. Preadolescents may generate a single causal hypothesis and seek confirmatory evidence, misinterpret contradictory evidence, or design experimental tests that do not provide informative evidence. In contrast, adolescents and adults may generate several alternative hypotheses and test them by systematically controlling variables and seeking both disconfirmatory and confirmatory evidence. Nevertheless, even adults often have difficulty designing valid scientific experiments. More generally,

both children and adults often have difficulty identifying multiple necessary or sufficient causes.

### Teaching Causal Reasoning Skills

The psychologist Diane Halpern argued in 1998 that critical thinking skills should be taught in primary, secondary, and higher educational settings. Casual reasoning is an important part of critical thinking because it enables one to explain and predict events, and thus potentially to control one's environment and achieve desired outcomes.

Three approaches to teaching causal reasoning skills may be efficacious. First, causal reasoning skills can be promoted by teaching students logical deduction. For example, teaching students to use counterfactual reasoning may help them assess whether there is a necessary relationship between a potential cause and an effect. Counterfactual reasoning requires student to imagine that a potential cause did not occur and to infer whether the effect would have occurred in its absence. If it would occur, then there is no causal relationship between the two events.

Second, causal reasoning skills can be promoted by teaching students to generate informal explanations for anomalous events or difficult material. For instance, learning from scientific texts can be particularly challenging to students, and often students have the misconception that they do not have adequate knowledge to understand texts. The psychologist Michelene Chi demonstrated in 1989 that students who use their general world knowledge to engage in causal, explanatory reasoning while reading difficult physics texts understand what they read considerably better than do students who do not draw upon general knowledge in this way. Furthermore, in 1999 the psychologist Danielle McNamara developed a reading training intervention that promotes explanatory reasoning during reading. In this program, students were taught a number of strategies to help them to use both information in the text and general knowledge to generate explanations for difficult material. Training improved both comprehension of scientific texts and overall class performance, and was particularly beneficial to at-risk students.

Third, the psychologist Leona Schauble demonstrated in 1990 that causal reasoning skills can be promoted by teaching students the principles of scientific experimentation. A primary goal of experimentation is to determine causal relationships

among a set of events. Students may be taught to identify a potential cause of an effect, manipulate the presence of the cause in a controlled setting, and assess whether or not the effect occurs. Thus, students learn to use the scientific method to determine whether there are necessary and sufficient relationships between a potential cause and an effect. Because the principles of science are often difficult for students to grasp, teaching these principles would provide students with formal procedures for evaluating causal relationships in the world around them.

#### CONCEPTUAL CHANGE

The term *conceptual change* refers to the development of fundamentally new concepts, through restructuring elements of existing concepts, in the course of knowledge acquisition. Conceptual change is a particularly profound kind of learning—it goes beyond revising one's specific beliefs and involves restructuring the very concepts used to formulate those beliefs. Explaining how this kind of learning occurs is central to understanding the tremendous power and creativity of human thought.

The emergence of fundamentally new ideas is striking in the history of human thought, particularly in science and mathematics. Examples include the emergence of Darwin's concept of evolution by natural selection, Newton's concepts of gravity and inertia, and the mathematical concepts of zero, negative, and rational numbers. One of the challenges of education is how to transmit these complex products of human intellectual history to the next generation of students.

Although there are many unresolved issues about how concepts are mentally represented, conceptual-change researchers generally assume that explanatory concepts are defined and articulated within theory-like structures, and that conceptual

change requires coordinated changes in multiple concepts within these structures. New concepts that have arisen in the history of science are clearly part of larger, explicit theories. Making an analogy between the organization of concepts in scientists and children, researchers have proposed that children may have “commonsense” theories in which their everyday explanatory concepts are embedded and play a role. These theories, although not self-consciously held, are assumed to be like scientific theories in that they consist of a set of interrelated concepts that resist change and that support inference making, problem solving, belief formation, and explanation in a given domain. The power and usefulness of this analogy is being explored in the early twenty-first century.

A challenge for conceptual-change researchers is to provide a typology of important forms of conceptual change. For example, conceptual differentiation is a form of conceptual change in which a newer (descendant) theory uses two distinct concepts where the initial (parent) theory used only one, and the undifferentiated parent concept unites elements that will subsequently be kept distinct. Examples of conceptual differentiation include: Galileo’s differentiation of average and instantaneous velocity in his theory of motion, Black’s differentiation of heat and temperature in his theory of thermal phenomena, and children’s differentiation of weight and density in their matter theory. Conceptual differentiation is not the same as adding new subcategories to an existing category, which involves the elaboration of a conceptual structure rather than its transformation. In that case, the new subcategories fit into an existing structure, and the initial general category is still maintained. In differentiation, the parent concept is seen as incoherent from the perspective of the subsequent theory and plays no role in it. For example, an undifferentiated weight/density concept that unites the elements *heavy* and *heavy-for-size* combines two fundamentally different kinds of quantities: an extensive (total amount) quantity and an intensive (relationally defined) quantity.

Another form of conceptual change is *coalescence*, in which the descendant theory introduces a new concept that unites concepts previously seen to be of fundamentally different types in the parent theory. For example, Aristotle saw circular planetary and free-fall motions as natural motions that were fundamentally different from violent projectile motions. Newton coalesced circular, planetary, free-fall,

and projectile motions under a new category, *accelerated motion*. Similarly, children initially see plants and animals as fundamentally different: animals are behaving beings that engage in self-generated movement, while plants are not. Later they come to see them as two forms of “living things” that share important biological properties. Conceptual coalescence is not the same as simply adding a more general category by abstracting properties common to more specific categories. In conceptual coalescence the initial concepts are thought to be fundamentally different, and the properties that will be central to defining the new category are not represented as essential properties of the initial concepts.

Different forms of conceptual change mutually support each other. For example, conceptual coalescences (such as uniting free-fall and projectile motion in a new concept of accelerated motion, or plants and animals in a new concept of living things) are accompanied by conceptual differentiations (such as distinguishing uniform from accelerated motion, or distinguishing dead from inanimate). These changes are also supported by additional forms of conceptual change, such as re-analysis of the core properties or underlying structure of the concept, as well as the acquisition of new specific beliefs about the relations among concepts.

### Mechanisms of Conceptual Change

One reason for distinguishing conceptual change from belief revision and conceptual elaboration is that different learning mechanisms may be required. Everyday learning involves knowledge enrichment and rests on an assumed set of concepts. For example, people use existing concepts to represent new facts, formulate new beliefs, make inductive or deductive inferences, and solve problems.

What makes conceptual change so challenging to understand is that it cannot occur in this way. The concepts of a new theory are ultimately organized and stated in terms of each other, rather than the concepts of the old theory, and there is no simple one-to-one correspondence between some concepts of the old and new theories. By what learning mechanisms, then, can scientists invent, and students comprehend, a genuinely new set of concepts and come to prefer them to their initial set of concepts?

Most theorists agree that one step in conceptual change for both students and scientists is experiencing some form of *cognitive dissonance*—an internal

state of tension that arises when an existing conceptual system fails to handle important data and problems in a satisfactory manner. Such dissonance can be created by a series of unexpected results that cannot be explained by an existing theory, by the press to solve a problem that is beyond the scope of one's current theory, or by the detection of internal inconsistencies in one's thinking. This dissonance can signal the need to step outside the normal mode of *applying* one's conceptual framework to a more meta-conceptual mode of *questioning, examining, and evaluating* one's conceptual framework.

Although experiencing dissonance can signal that there is a conceptual problem to be solved, it does not solve that problem. Another step involves active attempts to invent or construct an understanding of alternative conceptual systems by using a variety of heuristic procedures and symbolic tools. Heuristic procedures, such as analogical reasoning, imagistic reasoning, and thought experiments, may be particularly important because they allow both students and scientists to creatively extend, combine, and modify existing conceptual resources via the construction of new models. Symbolic tools, such as natural language, the algebraic and graphical representations of mathematics, and other invented notational systems, allow the explicit representation of key relations in the new system of concepts.

In analogical reasoning, knowledge of conceptual relations in better-understood domains are powerful sources of new ideas about the less-understood domain. Analogical reasoning is often supported by imagistic reasoning, wherein one creates visual depictions of core ideas using visual analogs with the same underlying relational structure. These depictions allow the visualization of unseen theoretical entities, connect the problem to the well-developed human visual-spatial inferencing system, and, because much mathematical information is implicit in such depictions, facilitate the construction of appropriate mathematical descriptions of a given domain. Thought experiments use initial knowledge of a domain to run simulations of what should happen in various idealized situations, including imagining what happens as the effects of a given variable are entirely eliminated, thus facilitating the identification of basic principles not self-evident from everyday observation.

Case studies of conceptual change in the history of science and science education reveal that new intellectual constructions develop over an extended

period of time and include intermediate, bridging constructions. For example, Darwin's starting idea of evolution via directed, adaptive variation initially prevented his making an analogy between this process and artificial selection. He transformed his understanding of this process using multiple analogies (first with wedging and Malthusian population pressure, and later with artificial selection), imagistic reasoning (e.g., visualizing the jostling effects of 100,000 wedges being driven into the same spot of ground to understand the tremendous power of the unseen force in nature and its ability to produce species change in a mechanistic manner), and thought experiments (e.g., imagining how many small effects might build up over multiple generations to yield a larger effect). Each contributed different elements to his final concept of natural selection, with his initial analogies leading to the bridging idea of selection acting in concert with the process of directed adaptive variation, rather than supplanting it.

Constructing a new conceptual system is also accompanied by a process of evaluating its adequacy against known alternatives using some set of criteria. These criteria can include: the new system's ability to explain the core problematic phenomena as well as other known phenomena in the domain, its internal consistency and fit with other relevant knowledge, the extent to which it meets certain explanatory ideals, and its capacity to suggest new fruitful lines of research.

Finally, researchers have examined the personal, motivational, and social processes that support conceptual change. Personal factors include courage, confidence in one's abilities, openness to alternatives, willingness to take risks, and deep commitment to an intellectual problem. Social factors include working in groups that combine different kinds of expertise and that encourage consideration of inconsistencies in data and relevant analogies. Indeed, many science educators believe a key to promoting conceptual change in the classroom is through creating a more reflective classroom discourse. Such discourse probes for alternative student views, encourages the clarification, negotiation, and elaboration of meanings, the detection of inconsistencies, and the use of evidence and argument in deciding among or integrating alternative views.

### **Educational Implications**

Conceptual change is difficult under any circumstances, as it requires breaking out of the self-

perpetuating circle of theory-based reasoning, making coordinated changes in a number of concepts, and actively constructing an understanding of new (more abstract) conceptual systems. Students need signals that conceptual change is needed, as well as good reasons to change their current conceptions, guidance about how to integrate existing conceptual resources in order to construct new conceptions, and the motivation and time needed to make those constructions. Traditional education practice often fails to provide students with the appropriate signals, guidance, motivation, and time.

Conceptual change is a protracted process calling for a number of coordinated changes in instructional practice. First, instruction needs to be grounded in the consideration of important phenomena or problems that are central to the experts' framework—and that challenge students' initial commonsense framework. These phenomena not only motivate conceptual change, but also constrain the search for, and evaluation of, viable alternatives. Second, instruction needs to guide students in the construction of new systems of concepts for understanding these phenomena. Teachers must know what heuristic techniques, representational tools, and conceptual resources to draw upon to make new concepts intelligible to students, and also how to build these constructions in a sequenced manner.

Third, instruction needs to be supported by a classroom discourse that encourages students to identify, represent, contrast, and debate the adequacy of competing explanatory frameworks in terms of emerging classroom epistemological standards. Such discourse supports many aspects of the conceptual-change process, including making students aware of their initial conceptions, helping students construct an understanding of alternative frameworks, motivating students to examine their conceptions more critically (in part through awareness of alternatives), and promoting their ability to evaluate, and at times integrate, competing frameworks.

Finally, instruction needs to provide students with extended opportunities for applying new systems of concepts to a wide variety of problems. Repeated applications develop students' skill at applying a new framework, refine their understanding of the framework, and help students appreciate its greater power and scope.

## KNOWLEDGE ACQUISITION, REPRESENTATION, AND ORGANIZATION

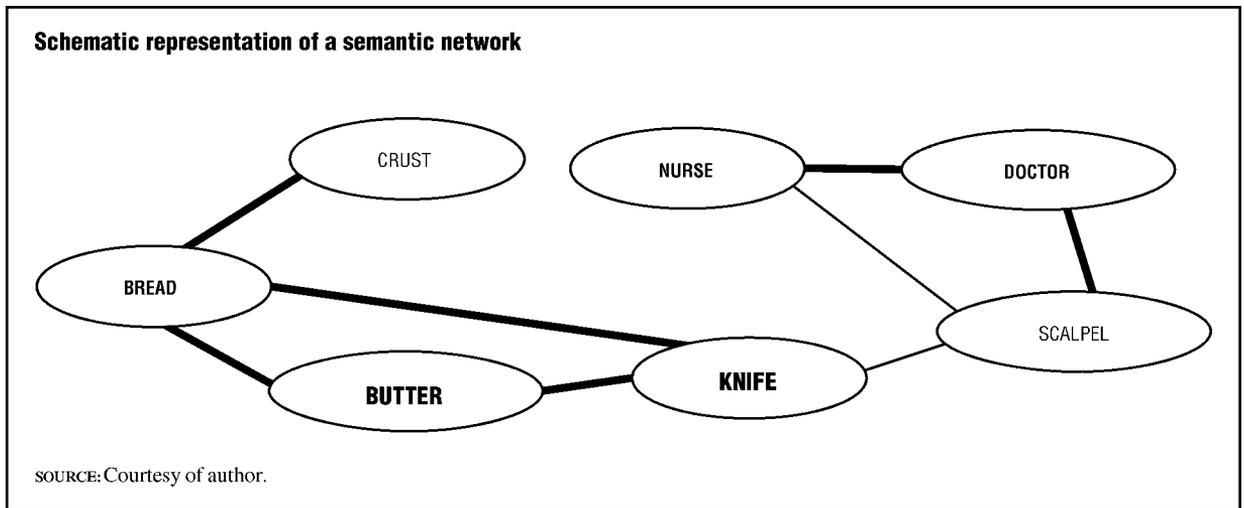

Knowledge acquisition is the process of absorbing and storing new information in memory, the success of which is often gauged by how well the information can later be remembered (retrieved from memory). The process of storing and retrieving information depends heavily on the representation and organization of the information. Moreover, the utility of knowledge can also be influenced by how the information is structured. For example, a bus schedule can be represented in the form of a map or a timetable. On the one hand, a timetable provides quick and easy access to the arrival time for each bus, but does little for finding where a particular stop is situated. On the other hand, a map provides a detailed picture of each bus stop's location, but cannot efficiently communicate bus schedules. Both forms of representation are useful, but it is important to select the representation most appropriate for the task at hand. Similarly, knowledge acquisition can be improved by considering the purpose and function of the desired information.

### Knowledge Representation and Organization

There are numerous theories of how knowledge is represented and organized in the mind, including rule-based production models, distributed networks, and propositional models. However, these theories are all fundamentally based on the concept of *semantic networks*. A semantic network is a method of representing knowledge as a system of connections between concepts in memory.

### Semantic Networks

According to semantic network models, knowledge is organized based on meaning, such that semantically related concepts are interconnected. Knowledge networks are typically represented as diagrams of nodes (i.e., concepts) and links (i.e., relations). The nodes and links are given numerical weights to represent their strengths in memory. In Figure 1, the node representing DOCTOR is strongly related to SCALPEL, whereas NURSE is weakly related to SCALPEL. These link strengths are represented here in terms of line width. Similarly, some nodes in Figure 1 are printed in bold type to represent their strength in memory. Concepts such as DOCTOR and BREAD are more memorable because they are

**FIGURE 1**

more frequently encountered than concepts such as SCALPEL and CRUST.

Mental excitation, or activation, spreads automatically from one concept to another related concept. For example, thinking of BREAD spreads activation to related concepts, such as BUTTER and CRUST. These concepts are *primed*, and thus more easily recognized or retrieved from memory. For example, in David Meyer and Roger Schvaneveldt's 1976 study (a typical semantic priming study), a series of words (e.g., BUTTER) and nonwords (e.g., BOTTOR) are presented, and participants determine whether each item is a word. A word is more quickly recognized if it follows a semantically related word. For example, BUTTER is more quickly recognized as a word if BREAD precedes it, rather than NURSE. This result supports the assumption that semantically related concepts are more strongly connected than unrelated concepts.

Network models represent more than simple associations. They must represent the ideas and complex relationships that comprise knowledge and comprehension. For example, the idea "The doctor uses a scalpel" can be represented as the proposition USE (DOCTOR, SCALPEL), which consists of the nodes DOCTOR and SCALPEL and the link USE (see Figure 2). Educators have successfully used similar diagrams, called concept maps, to communicate important relations and attributes among the key concepts of a lesson.

### Types of Knowledge

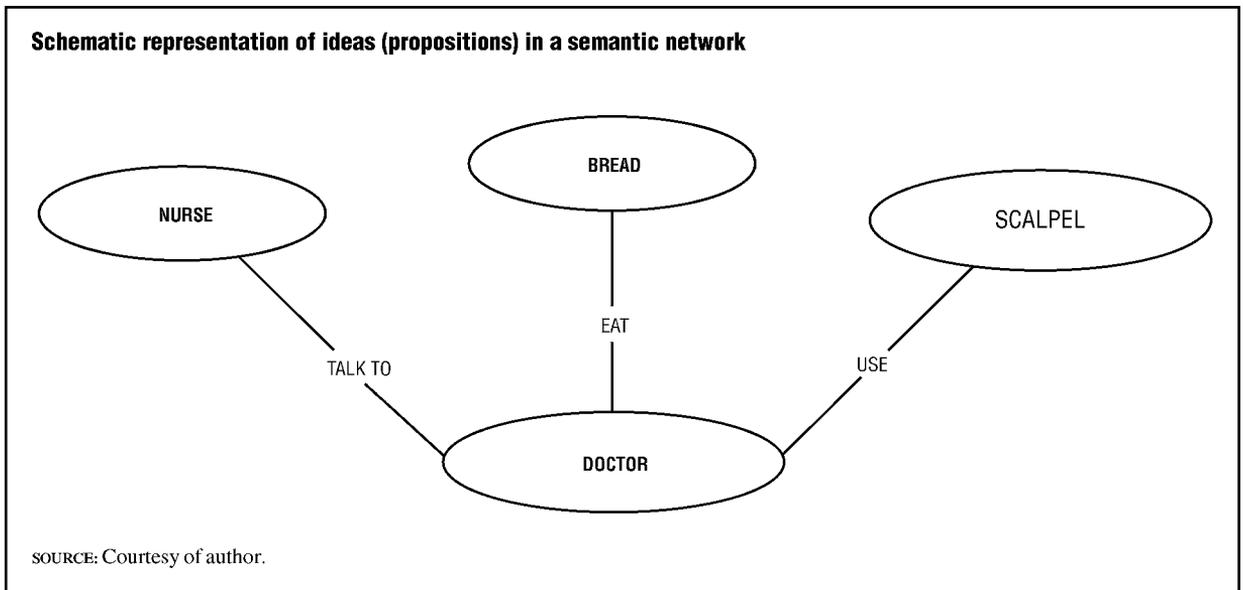

There are numerous types of knowledge, but the most important distinction is between *declarative* and *procedural* knowledge. Declarative knowledge refers to one's memory for concepts, facts, or episodes, whereas procedural knowledge refers to the ability to perform various tasks. Knowledge of how to drive a car, solve a multiplication problem, or throw a football are all forms of procedural knowledge, called *procedures* or *productions*. Procedural knowledge may begin as declarative knowledge, but is proceduralized with practice. For example, when first learning to drive a car, you may be told to "put the key in the ignition to start the car," which is a declarative statement. However, after starting the car numerous times, this act becomes automatic and is completed with little thought. Indeed, procedural knowledge tends to be accessed automatically and require little attention. It also tends to be more durable (less susceptible to forgetting) than declarative knowledge.

### Knowledge Acquisition

Listed below are five guidelines for knowledge acquisition that emerge from how knowledge is represented and organized.

**Process the material semantically.** Knowledge is organized semantically; therefore, knowledge acquisition is optimized when the learner focuses on the meaning of the new material. Fergus Craik and Endel Tulving were among the first to provide evidence for the importance of semantic processing. In their studies, participants answered questions con-

FIGURE 2

cerning target words that varied according to the depth of processing involved. For example, semantic questions (e.g., Which word, *friend* or *tree*, fits appropriately in the following sentence: “He met a \_\_\_ on the street?”) involve a greater depth of processing than phonemic questions (e.g., Which word, *crate* or *tree*, rhymes with the word *late*?), which in turn have a greater depth than questions concerning the structure of a word (e.g., Which word is in capital letters: *TREE* or *tree*?). Craik and colleagues found that words processed semantically were better learned than words processed phonemically or structurally. Further studies have confirmed that learning benefits from greater semantic processing of the material.

**Process and retrieve information frequently.** A second learning principle is to test and retrieve the information numerous times. Retrieving, or self-producing, information can be contrasted with simply reading or copying it. Decades of research on a phenomenon called the *generation effect* have shown that passively studying items by copying or reading them does little for memory in comparison to self-producing, or *generating*, an item. Moreover, learning improves as a function of the number of times information is retrieved. Within an academic situation, this principle points to the need for frequent practice tests, worksheets, or quizzes. In terms of studying, it is also important to break up, or *distribute* retrieval attempts. Distributed retrieval can include studying or testing items in a random order,

with breaks, or on different days. In contrast, repeating information numerous times sequentially involves only a single retrieval from long-term memory, which does little to improve memory for the information.

**Learning and retrieval conditions should be similar.** How knowledge is represented is determined by the conditions and context (internal and external) in which it is learned, and this in turn determines how it is retrieved: Information is best retrieved when the conditions of learning and retrieval are the same. This principle has been referred to as *encoding specificity*. For example, in one experiment, participants were shown sentences with an adjective and a noun printed in capital letters (e.g. The CHIP DIP tasted delicious.) and told that their memory for the nouns would be tested afterward. In the recognition test, participants were shown the noun either with the original adjective (CHIP DIP), with a different adjective (SKINNY DIP), or without an adjective (DIP). Noun recognition was better when the original adjective (CHIP) was presented than when no adjective was presented. Moreover, presenting a different adjective (SKINNY) yielded the lowest recognition. This finding underscores the importance of matching learning and testing conditions.

Encoding specificity is also important in terms of the questions used to test memory or comprehension. Different types of questions tap into different levels of understanding. For example, recalling in-

formation involves a different level of understanding, and different mental processes, than recognizing information. Likewise, essay and open-ended questions assess a different level of understanding than multiple-choice questions. Essay and open-ended questions generally tap into a conceptual or situational understanding of the material, which results from an integration of text-based information and the reader's prior knowledge. In contrast, multiple-choice questions involve recognition processes, and typically assess a shallow or text-based understanding. A text-based representation can be impoverished and incomplete because it consists only of concepts and relations within the text. This level of understanding, likely developed by a student preparing for a multiple-choice exam, would be inappropriate preparation for an exam with open-ended or essay questions. Thus, students should benefit by adjusting their study practices according to the expected type of questions.

Alternatively, students may benefit from reviewing the material in many different ways, such as recognizing the information, recalling the information, and interpreting the information. These latter processes improve understanding and maximize the probability that the various ways the material is studied will match the way it is tested. From a teacher's point of view, including different types of questions on worksheets or exams ensures that each student will have an opportunity to convey their understanding of the material.

#### **Connect new information to prior knowledge.**

Knowledge is interconnected; therefore, new material that is linked to prior knowledge will be better retained. A driving factor in text and discourse comprehension is prior knowledge. Skilled readers actively use their prior knowledge during comprehension. Prior knowledge helps the reader to fill in contextual gaps within the text and develop a better global understanding or situation model of the text. Given that texts rarely (if ever) spell out everything needed for successful comprehension, using prior knowledge to understand text and discourse is critical. Moreover, thinking about what one already knows about a topic provides connections in memory to the new information—the more connections that are formed, the more likely the information will be retrievable from memory.

**Create cognitive procedures.** Procedural knowledge is better retained and more easily accessed. Therefore, one should develop and use cognitive proce-

dures when learning information. Procedures can include shortcuts for completing a task (e.g., using *fast 10s* to solve multiplication problems), as well as memory strategies that increase the distinctive meaning of information. Cognitive research has repeatedly demonstrated the benefits of memory strategies, or *mnemonics*, for enhancing the recall of information. There are numerous types of mnemonics, but one well-known mnemonic is the *method of loci*. This technique was invented originally for the purpose of memorizing long speeches in the times before luxuries such as paper and pencil were readily available. The first task is to imagine and memorize a series of distinct locations along a familiar route, such as a pathway from one campus building to another. Each topic of a speech (or word in a word list) can then be pictured in a location along the route. When it comes time to recall the speech or word list, the items are simply *found* by mentally traveling the pathway.

Mnemonics are generally effective because they increase semantic processing of the words (or phrases) and render them more meaningful by linking them to familiar concepts in memory. Mnemonics also provide ready-made, effective cues for retrieving information. Another important aspect of mnemonics is that mental imaging is often involved. Images not only render information more meaningful, but they provide an additional route for finding information in memory. As mentioned earlier, increasing the number of meaningful links to information in memory increases the likelihood it can be retrieved.

Strategies are also an important component of *meta-cognition*, which is the ability to think about, understand, and manage one's learning. First, one must develop an awareness of one's own thought processes. Simply being aware of thought processes increases the likelihood of more effective knowledge construction. Second, the learner must be aware of whether or not comprehension has been successful. Realizing when comprehension has failed is crucial to learning. The final, and most important stage of meta-cognitive processing is fixing the comprehension problem. The individual must be aware of, and use, strategies to remedy comprehension and learning difficulties. For successful knowledge acquisition to occur, all three of these processes must occur. Without thinking or worrying about learning, the student cannot realize whether the concepts have been successfully grasped. Without realizing that in-

formation has not been understood, the student cannot engage in strategies to remedy the situation. If nothing is done about a comprehension failure, awareness is futile.

### Conclusion

Knowledge acquisition is integrally tied to how the mind organizes and represents information. Learning can be enhanced by considering the fundamental properties of human knowledge, as well as by the ultimate function of the desired information. The most important property of knowledge is that it is organized semantically; therefore, learning methods should enhance meaningful study of new information. Learners should also create as many links to the information as possible. In addition, learning methods should be matched to the desired outcome. Just as using a bus timetable to find a bus-stop location is ineffective, learning to recognize information will do little good on an essay exam.

## NEUROLOGICAL FOUNDATION

Learning is mediated by multiple memory systems in the brain, each of which involves a distinct anatomical pathway and supports a particular form of memory representation. The major aim of research on memory systems is to identify and distinguish the different contributions of specific brain structures and pathways, usually by contrasting the effects of selective damage to specific brain areas. Another major strategy focuses on localizing brain areas that are activated, that is, whose neurons are activated during particular aspects of memory processing. Some of these studies use newly developed functional imaging techniques to view activation of brain areas in humans performing memory tests. Another approach seeks to characterize the cellular code for memory within the activity patterns of single nerve cells in animals, by asking how information is represented by the activity patterns within the circuits of different structures in the relevant brain systems.

Each of the brain's memory systems begins in the vast expanse of the cerebral cortex, specifically in the so-called cortical association areas (see Figure 1). These parts of the cerebral cortex provide major inputs to each of three main pathways of processing in subcortical areas related to distinct memory functions. One system mediates *declarative memory*, the memory for facts and events that can be brought to conscious recollection and can be expressed in a variety of ways outside the context of learning. This system involves connections from the cortical association areas to the hippocampus via the parahippocampal region. The main output of hippocampal and parahippocampal processing is back to the same cortical areas that provided inputs to the hippocampus, and are viewed as the long-term repository of declarative memories.

The other two main pathways involve cortical inputs to specific subcortical targets that send direct outputs that control behavior. One of these systems mediates *emotional memory*, the attachment of affiliations and aversions towards otherwise arbitrary stimuli and modulation of the strength of memories that involve emotional arousal. This system involves cortical (as well as subcortical) inputs to the amygdala as the nodal stage in the association of sensory inputs to emotional outputs effected via the hypothalamic-pituitary axis and autonomic nervous system, as well as emotional influences over widespread brain areas. The second of these systems mediates

*procedural memory*, the capacity to acquire habitual behavioral routines that can be performed without conscious control. This system involves cortical inputs to the striatum as a nodal stage in the association of sensory and motor cortical information with voluntary responses via the brainstem motor system. An additional, parallel pathway that mediates different aspects of sensori-motor adaptations involves sensory and motor systems pathways through the cerebellum.

### The Declarative Memory System

Declarative memory is the “everyday” form of memory that most consider when they think of memory. Therefore, the remainder of this discussion will focus on the declarative memory system. Declarative memory is defined as a composite of episodic memory, the ability to recollect personal experiences, and semantic memory, the synthesis of the many episodic memories into the knowledge about the world. In addition, declarative memory supports the capacity for conscious recall and the flexible expression of memories, one's ability to search networks of episodic and semantic memories and to use this capacity to solve many problems.

Each of the major components of the declarative memory system contributes differently to declarative memory, although interactions between these areas are also essential. Initially, perceptual information as well as information about one's behavior is processed in many dedicated neocortical areas. While the entire cerebral cortex is involved in memory processing, the chief brain area that controls this processing is the prefrontal cortex. The processing accomplished by the prefrontal cortex includes the acquisition of complex cognitive rules and concepts and *working memory*, the capacity to store information briefly while manipulating or rehearsing the information under conscious control. In addition, the areas of the cortex also contribute critically to memory processing. Association areas in the prefrontal, temporal, and parietal cortex play a central role in cognition and in both the perception of sensory information and in maintenance of short-term traces of recently perceived stimuli. Furthermore, the organization of perceptual representations in cerebral cortical areas, and connections among these areas, are permanently modified by learning experiences, constituting the long term repository of memories.

The parahippocampal region, which receives convergent inputs from the neocortical association

areas and sends return projections to all of these areas, appears to mediate the extended persistence of these cortical representations. Through interactions between these areas, processing within the cortex can take advantage of lasting parahippocampal representations, and so come to reflect complex associations between events that are processed separately in different cortical regions or occur sequentially in the same or different areas.

These individual contributions and their interactions are not conceived as sufficient to link representations of events to form episodic memories or to form generalizations across memories to create a semantic memory network. Such an organization requires the capacity to rapidly encode a sequence of events that make up an episodic memory, to retrieve that memory by re-experiencing one facet of the event, and to link the ongoing experience to stored episodic representations, forming the semantic network. The neuronal elements of the hippocampus contain the fundamental coding properties that can support this kind of organization.

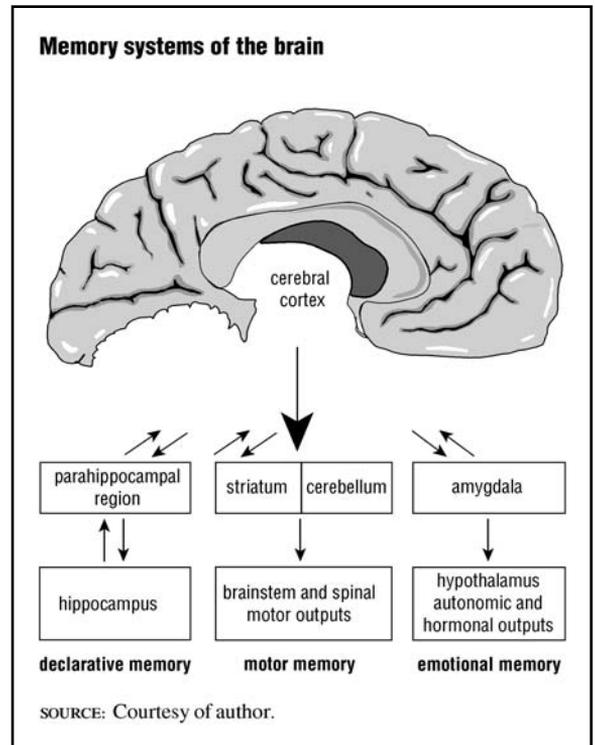

However, interactions among the components of the system are undoubtedly critical. It is unlikely that the hippocampus has the storage capacity to contain all of one's episodic memories and the hippocampus is not the final storage site. Therefore, it seems likely that the hippocampal neurons are involved in mediating the reestablishment of detailed cortical representations, rather than storing the details themselves. Repetitive interactions between the cortex and hippocampus, with the parahippocampal region as intermediary, serve to sufficiently coactivate widespread cortical areas so that they eventually develop linkages between detailed memories without hippocampal mediation. In this way, the networking provided by the hippocampus underlies its role in the organization of the permanent memory networks in the cerebral cortex.

## PERCEPTUAL PROCESSES

As Eleanor Gibson wrote in her classic text *Principles of Perceptual Learning and Development*, perceptual learning results in changes in the pickup of information as a result of practice or experience. Perception and action are a cycle: People act in order to learn about their surroundings, and they use what they learn to guide their actions. From this perspective, the critical defining features of perception include the exploratory actions of the perceiver and the knowledge of the events, animate and inanimate objects, and surrounding environment gained while

engaged in looking, listening, touching, walking, and other forms of direct observation. Perception often results in learning information that is directly relevant to the goals at hand, but sometimes it results in learning that is incidental to one's immediate goals.

Perception becomes more skillful with practice and experience, and perceptual learning can be thought of as the education of attention. Perceivers come to notice the features of situations that are relevant to their goals and not to notice the irrelevant features. Three general principles of perceptual learning seem particularly relevant. First, unskillful perceiving requires much concentrated attention, whereas skillful perceiving requires less attention and is more easily combined with other tasks. Second, unskillful perceiving involves noticing both the relevant and irrelevant features of sensory stimulation without understanding their meaning or relevance to one's goals, whereas skillful perceiving involves narrowing one's focus to relevant features and understanding the situations they specify. And third, unskillful perceiving often involves attention to the proximal stimulus (that is, the patterns of light or acoustic or pressure information on the retinas, cochleae, and skin, respectively), whereas skillful perceiving involves attention to the distal event that is specified by the proximal stimulus.

### Different Domains

Perceptual learning refers to relatively durable gains in perception that occur across widely different domains. For example, at one extreme are studies demonstrating that with practice adults can gain exquisite sensitivity to vernier discriminations, that is, the ability to resolve gaps in lines that approach the size of a single retinal receptor. At the opposite extreme, perceptual learning plays a central role in gaining expertise in the many different content areas of work, everyday life, and academic pursuits.

In the realm of work, classic examples include farmers learning to differentiate the sex of chickens, restaurateurs learning to differentiate different dimensions of fine wine, airplane pilots misperceiving their position relative to the ground, and machinists and architects learning to "see" the three-dimensional shape of a solid object or house from the top, side, and front views.

In the realm of everyday life, important examples include learning to perceive emotional expres-

sions, learning to identify different people and understand their facial expressions, learning to differentiate the different elements of speech when learning a second language, and learning to differentiate efficient routes to important destinations when faced with new surroundings.

In "nonacademic" subjects within the realm of academic pursuits, important examples involve music, art, and sports. For example, music students learn to differentiate the notes, chords, and instrumental voices in a piece, and they learn to identify pieces by period and composer. Art students learn to differentiate different strokes, textures, and styles, and they learn to classify paintings by period and artist. Athletes learn to differentiate the different degrees of freedom that need to be controlled to produce a winning "play" and to anticipate what actions need to be taken when on a playing field.

Finally, perceptual learning plays an equally broad role in classically academic subjects. For example, mathematics students gain expertise at perceiving graphs, classifying the shapes of curves, and knowing what equations might fit a given curve. Science students gain expertise at perceiving laboratory setups. These range widely across grade levels and domains, including the critical features of hydrolyzing water in a primary school general science setting, molecular structures in organic chemistry and genetics, frog dissections in biology, the functional relation of the frequency of waves and diffraction in different media in physics, and the critical features of maps in geology.

The borders separating perceptual learning from conceiving and reasoning often become blurred. And indeed, people perceive in order to understand, and their understanding leads to more and more efficient perception. For example, Herbert A. Simon elaborated on this in 2001 in his discussion of the visual thinking involved in having an expert understanding of the dynamics of a piston in an internal combustion engine. When experts look at a piston or a diagram of a piston or a graph representing the dynamics of a piston, they "see" the higher order, relevant variables, for example, that more work is performed when the combustion explosion moves the piston away from the cylinder's base than when the piston returns toward the base. The ability to "see" such higher-order relations is not just a question of good visual acuity, but it instead depends on content knowledge (about energy, pressure, and work) and on an understanding of how

energy acts in the context of an internal combustion engine. In a 2001 article, Daniel Schwartz and John Bransford emphasized that experience with contrasting cases helps students differentiate the critical features when they are working to understand statistics and other academic domains. In a 1993 article, J. Littlefield and John Rieser demonstrated the skill of middle school students at differentiating relevant from irrelevant information when attempting to solve story problems in mathematics.

### Classical Issues in Perceptual Learning and Perceptual Development

Perceptual development involves normative age-related changes in basic sensory sensitivities and in perceptual learning. Some of these changes are constrained by the biology of development in well-defined ways. For example, the growth in auditory frequency during the first year of life is mediated in part by changes in the middle ear and inner ear. Growth in visual acuity during the first two years is mediated in several ways: by changes in the migration of retinal cells into a fovea, through increasing control of convergence eye movements so that the two eyes fixate the same object, and through increasing control of the accommodate state of the lens so that fixated objects are in focus. The role of physical changes in the development of other perceptual skills, for example, perceiving different cues for depth, is less clear.

Nativism and empiricism are central to the study of perception and perceptual development. Stemming from philosophy's interest in epistemology, early nativists (such as seventeenth-century French mathematician and philosopher René Descartes and eighteenth-century German philosopher Immanuel Kant) argued that the basic capacities of the human mind were innate, whereas empiricists argued that they were learned, primarily through associations. This issue has long been hotly debated in the field of perceptual learning and development. How is it that the mind and brain come to perceive three-dimensional shapes from two-dimensional retinal projections; perceive distance; segment the speech stream; represent objects that become covered from view? The debate is very lively in the early twenty-first century, with some arguing that perception of some basic properties of the world is innate, and others arguing that it is learned, reflecting the statistical regularities in experience. Given that experience plays a role in some forms of perceptual learn-

ing, there is evidence that the timing of the experience can be critical to whether, and to what degree, it is learned effectively.

The “constancy” of perception is a remarkable feat of perceptual development. The issue is that the energy that gives rise to the perception of a particular object or situation varies widely when the perceiver or object moves, the lighting changes, and so forth. Given the flux in the sensory input, how is it that people manage to perceive that the objects and situations remain (more or less) the same? Research about perceptual constancies has reemerged as an important topic as computer scientists work to design artificial systems that can “learn to see.”

Intersensory coordination is a major feature of perception and perceptual development. How is it, for example, that infants can imitate adult models who open their mouths wide or stick out their tongues? How is it that infants can identify objects by looking at them or by touching them and can recognize people by seeing them or listening to them?

The increasing control of actions with age is a major result of perceptual learning, as infants become more skillful at perceiving steps and other features of the ground and learn to control their balance when walking up and down slopes.

In 1955 James Gibson and Eleanor Gibson wrote an important paper titled “Perceptual Learning: Differentiation or Enrichment?” By differentiation they meant skill at distinguishing smaller and smaller differences among objects of a given kind. By enrichment they meant knowledge of the ways that objects and events tend to be associated with other objects and events. Their paper was in part a reaction to the predominant view of learning at the time: that learning was the “enrichment” of responses through their association with largely arbitrary stimulus conditions. The authors provided a sharp counterpoint to this view. Instead of conceiving of the world as constructed by add-on processes of association, they viewed perceivers as actively searching for the stimuli they needed to guide their actions and decisions, and in this way coming to differentiate the relevant features situated in a given set of circumstances from the irrelevant ones.

## PROBLEM SOLVING

Cognitive processing aimed at figuring out how to achieve a goal is called *problem solving*. In problem solving, the *problem solver* seeks to devise a method for transforming a problem from its current state into a desired state when a solution is not immediately obvious to the problem solver. Thus, the hallmark of problem solving is the invention of a new method for addressing a problem. This definition has three parts: (1) problem solving is *cognitive*—that is, it occurs internally in the mind (or cognitive system) and must be inferred indirectly from behavior; (2) problem solving is a *process*—it involves the manipulation of knowledge representations (or carrying out mental computations); and (3) problem solving is *directed*—it is guided by the goals of the problem solver.

The definition of problem solving covers a broad range of human cognitive activities, including educationally relevant cognition—figuring out how to manage one's time, writing an essay on a selected topic, summarizing the main point of a textbook section, solving an arithmetic word problem, or determining whether a scientific theory is valid by conducting experiments.

A *problem* occurs when a problem solver has a goal but initially does not know how to achieve the goal. This definition has three parts: (1) the *current state*—the problem begins in a given state; (2) the *goal state*—the problem solver wants the problem to be in a different state, and problem solving is required to transform the problem from the current (or given) state into the goal state, and (3) *obstacles*—the problem solver does not know the correct solution and an effective solution method is not obvious to the problem solver.

According to this definition a problem is personal, so that a situation that is a problem for one person might not be a problem for another person. For example, “ $3 + 5 = \underline{\quad}$ ” might be a problem for a six-year-old child who reasons, “Let’s see. I can take one from the 5 and give it to the 3. That makes 4 plus 4, and I know that 4 plus 4 is 8.” However, this equation is not a problem for an adult who knows the correct answer.

### Types of Problems

**Routine and nonroutine problems.** It is customary to distinguish between routine and nonroutine problems. In a routine problem, the problem solver knows a solution method and only needs to carry it out. For example, for most adults the problem “ $589 \times 45 = \underline{\quad}$ ” is a routine problem if they know the procedure for multicolored multiplication. Routine problems are sometimes called exercises, and technically do not fit the definition of *problem* stated above. When the goal of an educational activity is to promote all the aspects of problem solving (including devising a solution plan), then nonroutine problems (or exercises) are appropriate.

In a nonroutine problem, the problem solver does not initially know a method for solving the problem. For example, the following problem (reported by Robert Sternberg and Janet Davidson) is nonroutine for most people: “Water lilies double in area every twenty-four hours. At the beginning of the summer, there is one water lily on the lake. It takes sixty days for the lake to be completely covered with water lilies. On what day is the lake half covered?” In this problem, the problem solver must invent a solution method based on working backwards from the last day. Based on this method, the problem solver can ask what the lake would look like on the day before the last day, and conclude that the lake is half covered on the fifty-ninth day.

**Well-defined and ill-defined problems.** It is also customary to distinguish between well-defined and ill-defined problems. In a well-defined problem, the given state of the problem, the goal state of the problem, and the allowable operators (or moves) are each clearly specified. For example, the following water-jar problem (adapted from Abraham Luchins) is an example of a well defined problem: “I will give you three empty water jars; you can fill any jar with water and pour water from one jar into another (until the second jar is full or the first one is empty); you can fill and pour as many times as you like. Given water

jars of size 21, 127, and 3 units and an unlimited supply of water, how can you obtain exactly 100 units of water?” This is a well-defined problem because the given state is clearly specified (you have empty jars of size 21, 127, and 3), the goal state is clearly specified (you want to get 100 units of water in one of the jars), and the allowable operators are clearly specified (you can fill and pour according to specific procedures). Well-defined problems may be either routine or nonroutine; if you do not have previous experience with water jar problems, then finding the solution (i.e., fill the 127, pour out 21 once, and pour out 3 twice) is a nonroutine problem.

In an ill-defined problem, the given state, goal state, and/or operations are not clearly specified. For example, in the problem, “Write a persuasive essay in favor of year-round schools,” the goal state is not clear because the criteria for what constitutes a “persuasive essay” are vague and the allowable operators, such as how to access sources of information, are not clear. Only the given state is clear—a blank piece of paper. Ill-defined problems can be routine or nonroutine; if one has extensive experience in writing then writing a short essay like this one is a routine problem.

### Processes in Problem Solving

The process of problem solving can be broken down into two major phases: *problem representation*, in which the problem solver builds a coherent mental representation of the problem, and *problem solution*, in which the problem solver devises and carries out a solution plan. Problem representation can be broken down further into *problem translation*, in which the problem solver translates each sentence (or picture) into an internal mental representation, and *problem integration*, in which the problem solver integrates the information into a coherent mental representation of the problem (i.e., a mental model of the situation described in the problem). Problem solution can be broken down further into *solution planning*, in which the problem solver devises a plan for how to solve the problem, and *solution execution*, in which the problem solver carries out the plan by engaging in solution behaviors. Although the four processes of problem solving are listed sequentially, they may occur in many different orderings and with many iterations in the course of solving a problem.

For example, consider the butter problem described by Mary Hegarty, Richard Mayer, and Christopher Monk: “At Lucky, butter costs 65 cents per

stick. This is two cents less per stick than butter at Vons. If you need to buy 4 sticks of butter, how much will you pay at Vons?" In the problem translation phase, the problem solver may mentally represent the first sentence as "Lucky = 0.65," the second sentence as "Lucky = Vons - 0.02," and the third sentence as "4 x Vons = \_\_\_\_." In problem integration, the problem solver may construct a mental number line with Lucky at 0.65 and Vons to the right of Lucky (at 0.67); or the problem solver may mentally integrate the equations as "4 x (Lucky + 0.02) = \_\_\_\_." A key insight in problem integration is to recognize the proper relation between the cost of butter at Lucky and the cost of butter at Vons, namely that butter costs more at Vons (even though the keyword in the problem is "less"). In solution planning, the problem solver may break the problem into parts, such as: "First add 0.02 to 0.65, then multiply the result by 4." In solution executing, the problem solver carries out the plan:  $0.02 + 0.65 = 0.67$ ,  $0.67 \times 4 = 2.68$ . In addition, the problem solver must monitor the problem-solving process and make adjustments as needed.

### Teaching for Problem Solving

A challenge for educators is to teach in ways that foster meaningful learning rather than rote learning. Rote instructional methods promote retention (the ability to solve problems that are identical or highly similar to those presented in instruction), but not problem solving transfer (the ability to apply what was learned to novel problems). For example, in 1929, Alfred Whitehead used the term *inert knowledge* to refer to learning that cannot be used to solve novel problems. In contrast, *meaningful instructional methods* promote both retention and transfer.

In a classic example of the distinction between rote and meaningful learning, the psychologist Max Wertheimer (1959) described two ways of teaching students to compute the area of a parallelogram. In the rote method, students learn to measure the base, measure the height, and then multiply base times height. Students taught by the  $A = b \times h$  method are able to find the area of parallelograms shaped like the ones given in instruction (a retention problem) but not unusual parallelograms or other shapes (a transfer problem). Wertheimer used the term *reproductive thinking* to refer to problem solving in which one blindly carries out a previously learned procedure. In contrast, in the meaningful method, students learn by cutting the triangle from one end of

a cardboard parallelogram and attaching it to the other end to form a rectangle. Once students have the insight that a parallelogram is just a rectangle in disguise, they can compute the area because they already know the procedure for finding the area of a rectangle. Students taught by the insight method perform well on both retention and transfer problems. Wertheimer used the term *productive thinking* to refer to problem solving in which one invents a new approach to solving a novel problem.

### Educationally Relevant Advances in Problem Solving

Recent advances in educational psychology point to the role of domain-specific knowledge in problem solving—such as knowledge of specific strategies or problem types that apply to a particular field. Three important advances have been: (1) the teaching of problem-solving processes, (2) the nature of expert problem solving, and (3) new conceptions of individual differences in problem-solving ability.

**Teaching of problem-solving processes.** An important advance in educational psychology is cognitive strategy instruction, which includes the teaching of problem-solving processes. For example, in Project Intelligence, elementary school children successfully learned the cognitive processes needed for solving problems similar to those found on intelligence tests. In Instrumental Enrichment, students who had been classified as mentally retarded learned cognitive processes that allowed them to show substantial improvements on intelligence tests.

**Expert problem solving.** Another important advance in educational psychology concerns differences between what experts and novices know in given fields, such as medicine, physics, and computer programming. For example, expert physicists tend to store their knowledge in large integrated chunks, whereas novices tend to store their knowledge as isolated fragments; expert physicists tend to focus on the underlying structural characteristics of physics word problems, whereas novices focus on the surface features; and expert physicists tend to work forward from the givens to the goal, whereas novices work backwards from the goal to the givens. Research on expertise has implications for professional education because it pinpoints the kinds of domain-specific knowledge that experts need to learn.

**Individual differences in problem-solving ability.** This third advance concerns new conceptions of in-

tellectual ability based on differences in the way people process information. For example, people may differ in cognitive style—such as their preferences for visual versus verbal representations, or for impulsive versus reflective approaches to problem solving. Alternatively, people may differ in the speed and efficiency with which they carry out specific cognitive processes, such as making a mental comparison or retrieving a piece of information from memory. Instead of characterizing intellectual ability as a single, monolithic ability, recent conceptions of intellectual ability focus on the role of multiple differences in information processing.

RICHARD E. MAYER

#### REASONING

*Reasoning* is the generation or evaluation of claims in relation to their supporting arguments and evidence. The ability to reason has a fundamental impact on one's ability to learn from new information and experiences because reasoning skills determine how people comprehend, evaluate, and accept claims and arguments. Reasoning skills are also crucial for being able to generate and maintain viewpoints or beliefs that are coherent with, and justified by, relevant knowledge. There are two general kinds of reasoning that involve claims and evidence: formal and informal.

##### Formal Reasoning

Formal reasoning is used to evaluate the form of an argument, and to examine the logical relationships between conclusions and their supporting assertions. Arguments are determined to be either *valid* or *invalid* based solely on whether their conclusions necessarily follow from their explicitly stated premises or assertions. That is, if the supporting assertions are true, must the conclusion also be true? If so, then the argument is considered valid and the truth of the conclusion can be directly determined by establishing the truth of the supporting assertions. If not, then the argument is considered invalid, and the truth of the assertions is insufficient (or even irrelevant) for establishing the truth of the conclusion. Formal reasoning is often studied in the context of *categorical syllogisms* or "*if-then*" conditional proofs. Syllogisms contain two assertions and a conclusion.

An example of a logically valid syllogism is: *All dogs are animals; all poodles are dogs; therefore poodles are animals.* A slight change to one of the premises will create the invalid syllogism: *All dogs are animals; some dogs are poodles; therefore all poodles are animals.* This argument form is invalid because it cannot be determined with certainty that the conclusion is true, even if the premises are true. The second premise does not require that all poodles are dogs. Thus, there may be some poodles who are not dogs and, by extension, some poodles who are not animals. This argument is invalid despite the fact that an accurate knowledge of dogs, poodles, and animals confirms that both the premises and the conclusion are true statements. This validity-truth incongruence highlights the important point that the conceptual content of an argument or the real-world truth of the premises and conclusion are irrelevant to the logic of the argument form.

Discussions of formal reasoning may sometimes refer to the rules of logic. It is common for formal reasoning to be described as a set of abstract and prescriptive rules that people must learn and apply in order to determine the validity of an argument. This is the oldest perspective on formal reasoning. Some claim that the term *formal reasoning* refers directly to the application of these formal rules.

However, many theorists consider this perspective misguided. Describing formal reasoning as the evaluation of argument forms conveys a more inclusive and accurate account of the various perspectives in this field. There are at least four competing theories about how people determine whether a conclusion necessarily follows from the premises. These theories are commonly referred to as *rule-based perspectives*, *mental models*, *heuristics*, and *domain-sensitive theories*. People outside the rule-based perspective view the rules of logic as descriptive rules that simply give labels to common argument forms and to common errors or fallacies in logical reasoning. These theories are too complex to be detailed here, and there is currently no consensus as to which theory best accounts for how people actually reason. A number of books and review articles provide comprehensive discussions of these theories and their relative merits; one example is *Human Reasoning: The Psychology of Deduction* by Jonathan Evans, Stephen Newstead, and Ruth Byrne.

There is a consensus that human reasoning performance is poor and prone to several systematic errors. Performance on formal reasoning tasks is

generally poor, but can be better or worse depending upon the particular aspects of the task. People perform worse on problems that require more cognitive work, due to excessive demands placed on their limited processing capacity or working memory. The required cognitive work can be increased simply by having more information, or by the linguistic form of the argument. Some linguistic forms can affect performance because they violate conventional discourse or must be mentally rephrased in order to be integrated with other information.

In addition, people's existing knowledge about the concepts contained in the problem can affect performance. People have great difficulty evaluating the logical validity of an argument independent of their real-world knowledge. They insert their knowledge as additional premises, which leads them to make more inferences than is warranted. Prior knowledge can also lead people to misinterpret the meaning of premises. Another common source of error is *belief bias*, where people judge an argument's validity based on whether the conclusion is consistent with their beliefs rather than its logical relationship to the given premises.

The systematic errors that have been observed provide some insights about what skills a person might develop to improve performance. Making students explicitly aware of the likely intrusion of their prior knowledge could facilitate their ability to control or correct such intrusions. Students may also benefit from a detailed and explicit discussion of what logical validity refers to, how it differs from real-world truth or personal agreement, and how easy it is to confuse the two. Regardless of whether or not people commonly employ formal rules of logic, an understanding and explicit knowledge of these rules should facilitate efforts to search for violations of logical validity. Theorists of informal reasoning such as James Voss and Mary Means have made a similar argument for the importance of explicit knowledge about the rules of good reasoning. Errors attributed to limited cognitive resources can be addressed by increasing reasoning skill, and practice on formal reasoning tasks should increase proficiency and reduce the amount of cognitive effort required. Also, working memory load should be reduced by external representation techniques, such as Venn diagrams.

## Informal Reasoning

Informal reasoning refers to attempts to determine what information is relevant to a question, what conclusions are plausible, and what degree of support the relevant information provides for these various conclusions. In most circumstances, people must evaluate the justification for a claim in a context where the information is ambiguous and incomplete and the criteria for evaluation are complex and poorly specified. Most of what is commonly referred to as “thinking” involves informal reasoning, including making predictions of future events or trying to explain past events. These cognitive processes are involved in answering questions as mundane as “How much food should I prepare for this party?” and as profound as “Did human beings evolve from simple one-celled organisms?” Informal reasoning has a pervasive influence on both the everyday and the monumental decisions that people make, and on the ideas that people come to accept or reject.

Informal and formal reasoning both involve attempts to determine whether a claim has been sufficiently justified by the supporting assertions, but these types of reasoning differ in many respects. The vast majority of arguments are invalid according to formal logic, but informal reasoning must be employed to determine what degree of justification the supporting assertions provide. Also, the supporting assertions themselves must be evaluated as to their validity and accuracy. Formal reasoning involves making a binary decision based only on the given information. Informal reasoning involves making an uncertain judgment about the degree of justification for a claim relative to competing claims—and basing this evaluation on an ill-defined set of assertions whose truth values are uncertain.

Based on the above characterization of informal reasoning, a number of cognitive skills would be expected to affect the quality of such reasoning. The first is the ability to fully comprehend the meaning of the claim being made. Understanding the conceptual content is crucial to being able to consider what other information might bear on the truth or falsehood of a claim. Other cognitive processes involved in reasoning include the retrieval of relevant knowledge from long-term memory, seeking out new relevant information, evaluating the validity and utility of that information, generating alternatives to the claim in question, and evaluating the competing claims in light of the relevant information.

Successful reasoning requires the understanding that evidence must provide information that is independent of the claim or theory, and that evidence must do more than simply rephrase and highlight the assumptions of the theory. For example, the assertion “Some people have extrasensory perception” does not provide any evidence about the claim “ESP is real.” These are simply ways of restating the same information. Evidence must be an assertion that is independent of the claim, but that still provides information about the probable truth of the claim. An example of potential evidence for the claim that “ESP is real” would be “Some people know information that they could not have known through any of the normal senses.” In other words, evidence constitutes assertions whose truth has implications for, but is not synonymous with, the truth of the claim being supported.

Without an understanding of evidence and counterevidence and how they relate to theories, people would be ineffective at identifying information that could be used to determine whether a claim is justified. Also, lack of a clear distinction between evidence and theory will lead to the assimilation of evidence and the distortion of its meaning and logical implications. This eliminates the potential to consider alternative claims that could better account for the evidence. People will also fail to use counterevidence to make appropriate decreases in the degree of justification for a claim.

Discussions of informal reasoning, argumentation, and critical thinking commonly acknowledge that a prerequisite for effective reasoning is a belief in the utility of reasoning. The cognitive skills described above are necessary, but not sufficient, to produce quality reasoning. The use of these skills is clearly effortful; thus, people must believe in the importance and utility of reasoning in order to consistently put forth the required effort. The epistemology that promotes the use of reasoning skills is the view that knowledge can never be absolutely certain and that valid and useful claims are the product of contemplating possible alternative claims and weighing the evidence and counterevidence. Put simply, people use their reasoning skills consistently when they acknowledge the possibility that a claim may be incorrect and also believe that standards of good reasoning produce more accurate ideas about the world.

Inconsistent, selective, and biased application of reasoning skills provides little or no benefits for

learning. Greater reasoning skills are assumed to aid in the ability to acquire new knowledge and revise one's existing ideas accordingly. However, if one contemplates evidence and theory only when it can be used to justify one's prior commitments, then only supportive information will be learned and existing ideas will remain entrenched and unaffected. The development of reasoning skills will confer very little intellectual benefit in the absence of an epistemological commitment to employ those skills consistently.

### General Reasoning Performance

Reports from the National Assessment of Educational Progress and the National Academy of Sciences consistently show poor performance on a wide array of tasks that require informal reasoning. These tasks span all of the core curriculum areas of reading, writing, mathematics, science, and history.

Some smaller-scale studies have attempted to paint a more detailed picture of what people are doing, or failing to do, when asked to reason. People demonstrate some use of informal reasoning skills, but these skills are underdeveloped and applied inconsistently. Children and adults have a poor understanding of evidence and its relationship to theories or claims. Only a small minority of people attempt to justify their claims by providing supporting evidence. When explicitly asked for supporting evidence, most people simply restate the claim itself or describe in more detail what the claim means. It is especially rare for people to generate possible counter-evidence or to even consider possible alternative claims.

The inconsistent application of informal reasoning skills could have multiple causes. Some theorists suggest that reasoning skills are domain specific and depend heavily on the amount of domain knowledge a person possesses. Alternatively, underdeveloped or unpracticed skills could lead to their haphazard use. A third possibility is that people's lack of explicit knowledge about what good reasoning entails prevents them from exercising conscious control over their implicit skills.

Inconsistent use of informal reasoning skills may also arise because people lack a principled belief in the utility of reasoning that would foster a consistent application of sound reasoning. People have extreme levels of certainty in their ideas, and they take this certainty for granted. In addition, the applica-

tion of reasoning skills is not random, but is selective and biased such that prior beliefs are protected from scrutiny. This systematic inconsistency cannot be accounted for by underdeveloped skills, but can be accounted for by assuming a biased motivation to use these skills selectively. Regardless of whether or not people have the capacity for sound reasoning, they have no philosophical basis that could provide the motivation to override the selective and biased use of these skills.

### Development of Reasoning Skills

There is only preliminary data about how and when informal reasoning skills develop. There is preliminary support that the development of reasoning takes a leap forward during the preadolescent years. These findings are consistent with Piagetian assumptions about the development of *concrete operational thinking*, in other words, thinking that involves the mental manipulation (e.g., combination, transformation) of objects represented in memory. However, younger children are capable of some key aspects of reasoning. Thus, the improvement during early adolescence could result from improvements in other subsidiary skills of information processing, from meta-cognitive awareness, or from an increase in relevant knowledge.

A somewhat striking finding is the lack of development in informal reasoning that occurs from early adolescence through adulthood. Some evidence suggests that college can improve reasoning, but the overall relationship between the amount of postsecondary education and reasoning skill is weak at best. The weak and inconsistent relationship that does exist between level of education and reasoning is likely due to indirect effects. Students are rarely required to engage in complex reasoning tasks. However, the spontaneous disagreements that arise in the classroom could expose them to the practice of justifying one's claim. Also, engagement in inquiry activities, such as classroom experiments, could provide implicit exposure to the principles of scientific reasoning.

There are relatively few programs aimed at developing informal reasoning skills; hence, there is little information about effective pedagogical strategies. Where they do exist, curricula are often aimed at developing general reasoning skills. Yet, many believe that effective reasoning skills are domain- or discipline-specific. Nevertheless, given the pervasive impact of reasoning skills on learning in general, it

is clear that more systematic efforts are needed to foster reasoning skills at even the earliest grade levels. Of the approaches that have been attempted, there is some evidence for the success of *scaffolding*, which involves a teacher interacting with a student who is attempting to reason, and prompting the student to develop more adequate arguments. Another approach is to explicitly teach what *good reasoning* means, what *evidence* is, and how evidence relates to theories. This approach could be especially effective if classroom experiments are conducted within the context of explicit discussions about the principles of scientific reasoning. Also, if reasoning skills are discussed in conjunction with the content of the core subject areas, then students may develop an appreciation for the pervasive utility and importance of reasoning for the progress of ideas.

A number of theorists have suggested that debate between students with opposing views could foster the basic skills needed for informal reasoning. Debates could give students practice in having to consider opposing viewpoints and having to coordinate evidence and counterevidence in support of a claim. Also, providing justification for one's positions requires some cognitive effort, and the norms of social dialogue could provide the needed motivation. However, interpersonal debates are most commonly construed as situations in which individuals are committed to a position ahead of time, and in which their goal is to frame the issue and any evidence in a manner that will persuade their opponent or the audience that their own position is correct. Students' reasoning is already greatly impaired by their tendency to adopt a biased, defensive, or non-contemplative stance. Debate activities that reinforce this stance and blur the difference between defending a claim and contemplating a claim's justification may do more harm than good. To date, there is no empirical data that compare the relative costs and benefits of using interpersonal debate exercises to foster critical reasoning skills.

## TRANSFER OF LEARNING

Imagine that every time that people entered a new environment they had to learn how to behave without the guidance of prior experiences. Slightly novel tasks, like shopping online, would be disorienting and dependant on trial-and-error tactics. Fortunately, people use aspects of their prior experiences, such as the selection of goods and subsequent payment, to guide their behavior in new settings. The ability to use learning gained in one situation to help with another is called *transfer*.

Transfer has a direct bearing on education. Educators hope that students transfer what they learn from one class to another—and to the outside world. Educators also hope students transfer experiences from home to help make sense of lessons at school. There are two major approaches to the study of transfer. One approach characterizes the knowledge and conditions of acquisition that optimize the chances of transfer. The other approach inquires into the nature of individuals and the cultural contexts that transform them into more adaptive participants.

### Knowledge-Based Approaches to Transfer

There are several knowledge-based approaches to transfer.

**Transferring out from instruction.** Ideally, the knowledge students learn in school will be applied outside of school. For some topics, it is possible to train students for the specific situations they will subsequently encounter, such as typing at a keyboard. For other topics, educators cannot anticipate all the out-of-school applications. When school-based lessons do not have a direct mapping to out-of-school contexts, memorization without understanding can lead to inert knowledge. Inert knowledge occurs when people acquire an idea without also learning the conditions of its subsequent application, and thus they fail to apply that idea appropriately. Memorizing the Pythagorean formula, for example, does not guarantee students know to use the formula to find the distance of a shortcut.

Knowing when to use an idea depends on knowing the contexts in which the idea is useful. The ideas that people learn are always parts of a larger context, and people must determine which aspects of that context are relevant. Imagine, for example, a young child who is learning to use the hook of a candy cane to pull a toy closer. As the child learns the action,

there are a number of contextual features she might also learn. There are incidental features—it is Christmas; there are surface features—the candy is small and striped; and there are deep features—the candy cane is rigid and hooked. Instruction for transfer must help the child discern the deep features. This way the child might subsequently use an umbrella handle to gather a stuffed animal instead of trying a candy-striped rope.

When people learn, they not only encode the target idea, they also encode the context in which it occurs, even if that context is incidental. For a study published in 1975, Gooden and Baddeley asked adults to learn a list of words on land or underwater (while scuba diving). Afterwards, the adults were subdivided; half tried to remember the words underwater and half on land. Those people who learned the words underwater remembered them better underwater than on land, and those people who learned the words on land remembered them better on land than underwater. This result reveals the context dependency of memory. Context dependency is useful because it constrains ideas to appear in appropriate contexts, rather than cluttering people's thoughts at odd times. But context dependency can be a problem for transfer, because transfer, by definition, has to occur when the original context of learning is not reinstated—when one is no longer in school, for example.

Surface features, which are readily apparent to the learner, differ from incidental features, because surface features are attached to the idea rather than the context in which the idea occurs. Surface features can be useful. A child might learn that fish have fins and lay eggs. When he sees a new creature with fins, he may decide it is a fish and infer that it too lays eggs. Surface features, however, can be imperfect cues. People may overgeneralize and exhibit *negative transfer*. For example, the child may have seen a dolphin instead of a fish. People may also undergeneralize and fail to transfer. A child might see an eel and assume it does not lay eggs. Good instruction helps students see beneath the surface to find the deep features of an idea.

Deep features are based on structures integral to an idea, which may not be readily apparent. To a physicist, an inclined plane and scissors share the same deep structure of leverage, but novices cannot see this similarity and they fail to use a formula learned for inclined planes to reason about scissors.

Analogies are built on deep features. For example, color is to picture as sound is to song. On the surface, color and sound differ, as do pictures and song. Nonetheless, the relation of *used to create* makes it possible to compare the common structure between the two. Analogy is an important way people discover deep features. In the 1990s, Kevin Dunbar studied the laboratory meetings of cell biologists. He found that the scientists often used analogies to understand a new discovery. They typically made transfers of *near* analogies rather than *far* ones. A far analogy transfers an idea from a remote body of knowledge that shares few surface features, as might be the case when using the structure of the solar system to explain the structure of an atom. A near analogy draws on a structure that comes from a similar body of knowledge. The scientists in Dunbar's study used near analogies from biology because they had precise knowledge of biology, which made for a more productive transfer.

Instruction can help students determine deep features by using analogous examples rather than single examples. In a 1983 study, Mary Gick and Keith Holyoak asked students how to kill a tumor with a burst of radiation, given that a strong burst kills nearby tissue and a weak burst does not kill the tumor. Students learned that the solution uses multiple weak radiation beams that converge on the tumor. Sometime later, the students tried to solve the problem of how a general could attack a fortress: If the general brought enough troops to attack the fortress, they would collapse the main bridge. Students did not propose that the general could split his forces over multiple bridges and then converge on the fortress. The students' knowledge of the convergence solution was inert, because it was only associated with the radiation problem. Gick and Holyoak found they could improve transfer by providing two analogous examples instead of one. For example, students worked with the radiation problem and an analogous traffic congestion problem. This helped students abstract the convergence schema from the radiation context, and they were able to transfer their knowledge to the fortress problem.

**Transferring in to instruction.** In school, transfer can help students learn. If students can *transfer in* prior knowledge, it will help them understand the content of a new lesson. A lesson on the Pythagorean theorem becomes more comprehensible if students can transfer in prior knowledge of right triangles.

Otherwise, the lesson simply involves pushing algebraic symbols.

Unlike transfer to out-of-school settings, which depends on the spontaneous retrieval of relevant prior knowledge, transfer to in-school settings can be directly supported by teachers. A common approach to help students recruit prior knowledge uses *cover stories* that help students see the relevance of what they are about to learn. A teacher might discuss the challenge of finding the distance of the moon from the earth to motivate a lesson on trigonometry. This example includes two ways that transferring in prior knowledge can support learning. Prior knowledge helps students understand the problems that a particular body of knowledge is intended to solve—in this case, problems about distance. Prior knowledge also enables learners to construct a mental model of the situation that helps them understand what the components of the trigonometric formulas refer to.

Sometimes students cannot transfer knowledge to school settings because they do not have the relevant knowledge. One way to help overcome a lack of prior knowledge is to use contrasting cases. Whereas pairs of analogies help students abstract deep features from surface features, pairs of contrasting cases help students notice deep features in the first place. Contrasting cases juxtapose examples that only differ by one or two features. For example, a teacher might ask students to compare examples of acute, right, and obtuse triangles. Given the contrasts, students can notice what makes a right triangle distinctive, which in turn, helps them construct precise mental models to understand a lesson on the Pythagorean theorem.

### Person-Based Approaches to Transfer

The second approach to transfer asks whether person-level variables affect transfer. For example, do IQ tests or persistence predict the ability to transfer? Person-based research relevant to instruction asks whether some experiences can transform people in general ways.

**Transferring out from instruction.** An enduring issue has been whether instruction can transform people into better thinkers. People often believe that mastering a formal discipline, like Latin or programming, improves the rigor of thought. Research has shown that it is very difficult to improve people's reasoning, with instruction in logical reasoning

being notoriously difficult. Although people may learn to reason appropriately for one situation, they do not necessarily apply that reasoning to novel situations. More protracted experiences, however, may broadly transform individuals to the extent that they apply a certain method of reasoning in general, regardless of situational context. For example, the cultural experiences of American and Chinese adults lead them to approach contradictions differently.

There have also been attempts to improve learning abilities by improving people's ability to transfer. Ann Brown and Mary Jo Kane showed young children how to use a sample solution to help solve an analogous problem. After several lessons on transferring knowledge from samples to problems, the children spontaneously began to transfer knowledge from one example to another. Whether this type of instruction has broad effects—for example, when the child leaves the psychologist's laboratory—remains an open question. Most likely, it is the accumulation of many experiences, not isolated, short-term lessons, that has broad implications for personal development.

**Transferring in to instruction.** When children enter school, they come with identities and dispositions that have been informed by the practices and roles available in their homes and neighborhoods. Schools also have practices and roles, but these can seem foreign and inhospitable to out-of-school identities. Na'ilah Nasir, for example, found that students did not transfer their basketball "street statistics" to make sense of statistics lessons in their classrooms (nor did they use school-learned procedures to solve statistics problems in basketball). From a knowledge approach to transfer, one might argue that the school and basketball statistics were analogous, and that the children failed to see the common deep features. From a person approach to transfer, the cultural contexts of the two settings were so different that they supported different identities, roles, and interpretations of social demands. People can view and express themselves quite differently in school and nonschool contexts, and there will therefore be little transfer.

One way to bridge home and school is to alter instructional contexts so children can build identities and practices that are consistent with their out-of-school personae. Educators, for example, can bring elements of surrounding cultures into the classroom. In one intervention, African-American students learned literary analysis by building on

their linguistic practice of signifying. These children brought their cultural heritage to bear on school subjects, and this fostered a school-based identity in which students viewed themselves as competent and engaged in school.

### Conclusion

The frequent disconnect between in-school and out-of-school contexts has led some researchers to argue that transfer is unimportant. In 1988, Jean Lave compared how people solved school math problems and best-buy shopping problems. The adults rarely used their school algorithms when shopping. Because they were competent shoppers and viewed themselves as such, one might conclude that school-based learning does not need to transfer. This conclusion, however, is predicated on a narrow view of transfer that is limited to identical uses of what one has learned or to identical expressions of identity.

From an educational perspective, the primary function of transfer should be to prepare people to learn something new. So, even though shoppers did not use the exact algorithms they had learned in school, the school-based instruction prepared them to learn to solve best-buy problems when they did not have paper and pencil at hand. This is the central relevance of transfer for education. Educators cannot create experts who spontaneously transfer their knowledge or identities to handle every problem or context that might arise. Instead, educators can only put students on a trajectory to expertise by preparing them to transfer for future learning.

## LEARNING COMMUNITIES AND THE UNDERGRADUATE CURRICULUM

---

Educational observers have long argued that student involvement is important to student education. Indeed a wide range of studies, in a variety of settings and of a range of students, have confirmed that academic and social involvement, sometimes referred to as academic and social integration, enhances student development, improves student learning, and increases student persistence. Simply put, involvement matters. But getting students involved can be difficult. This is especially true for the majority of college students who commute to college, who work while in college, or have substantial family responsibilities beyond college. Unlike students who reside on campus, these students have few, if any, opportunities to engage others beyond the classroom.

For that reason an increasing number of universities and colleges, both two- and four-year, have turned their attention to the classroom—the one place, perhaps the only place, where students meet each other and the faculty. Researchers have asked how that setting can be altered to better promote student involvement and in turn improve student education. In response, schools have begun to institute a variety of curricular and pedagogical reforms ranging from the use of cooperative and problem-based learning to the inclusion of service learning in the college curriculum. One reform that is gaining attention, that addresses both the need for student involvement and the demands for curricular coherence, is the use of learning communities.

Learning communities, in their most basic form, begin with a kind of co-registration or block scheduling that enables students to take courses together, rather than in isolation. In some cases, learning communities will help students make connections with linked courses—tying two courses together, typically a course in writing with a course in selected literature or current social problems. In other cases, it may mean sharing the entire first-semester curriculum so that students in the learning community study the same material throughout the semester. In some large universities such as the University of Oregon and the University of Washington, the twenty-five to thirty students in a learning community may attend lectures with 200 to 300 other students but stay together for a smaller discussion section, often called the Freshman Interest Group, led by a graduate student or upperclassman. In still other cases, students will take all their classes together either as separate, but linked, classes (Cluster Learning Communities) or as one large class that meets four to six hours at a time several times per week (Coordinated Studies). Figure 1 shows examples of these learning community models.

The courses in which students co-register are not coincidental or random. They are typically connected by an organizing theme that gives meaning to their linkage. The point of doing so is to engender a coherent interdisciplinary or cross-subject learning that is not easily attainable through enrollment in unrelated, stand-alone courses. For example, a Coordinated Studies Program at Seattle Central Community College is titled “Body and Mind.” It links courses in human biology, psychology, and sociology, and asks students to consider how the connected fields of study pursue a singular piece of knowledge, namely how and why humans behave as they do.

As described by Faith Gabelnick and her colleagues in their 1990 book *Learning Communities: Creating Connections among Students, Faculty, and Disciplines*, many learning communities do more than co-register students around a topic. They change the manner in which students experience the curriculum and the way they are taught. Faculty have reorganized their syllabi and their classrooms to promote shared, collaborative learning experiences among students across the linked classrooms. This form of classroom organization requires students to work together in some form of collaborative groups and to become active, indeed responsible, for the learning of both group and classroom peers. In

this way students are asked to share not only the experience of the curriculum, but also of learning within the curriculum.

### Learning Communities as Curriculum Structure

Although the content may vary, nearly all learning communities have three things in common. One is *shared knowledge*. By requiring students to take courses together and organizing those courses around a theme, learning communities seek to construct a shared, coherent curricular experience that is not just an unconnected array of courses in, say, composition, calculus, history, Spanish, and geology. In doing so they seek to promote higher levels of cognitive complexity that cannot easily be obtained through participation in unrelated courses.

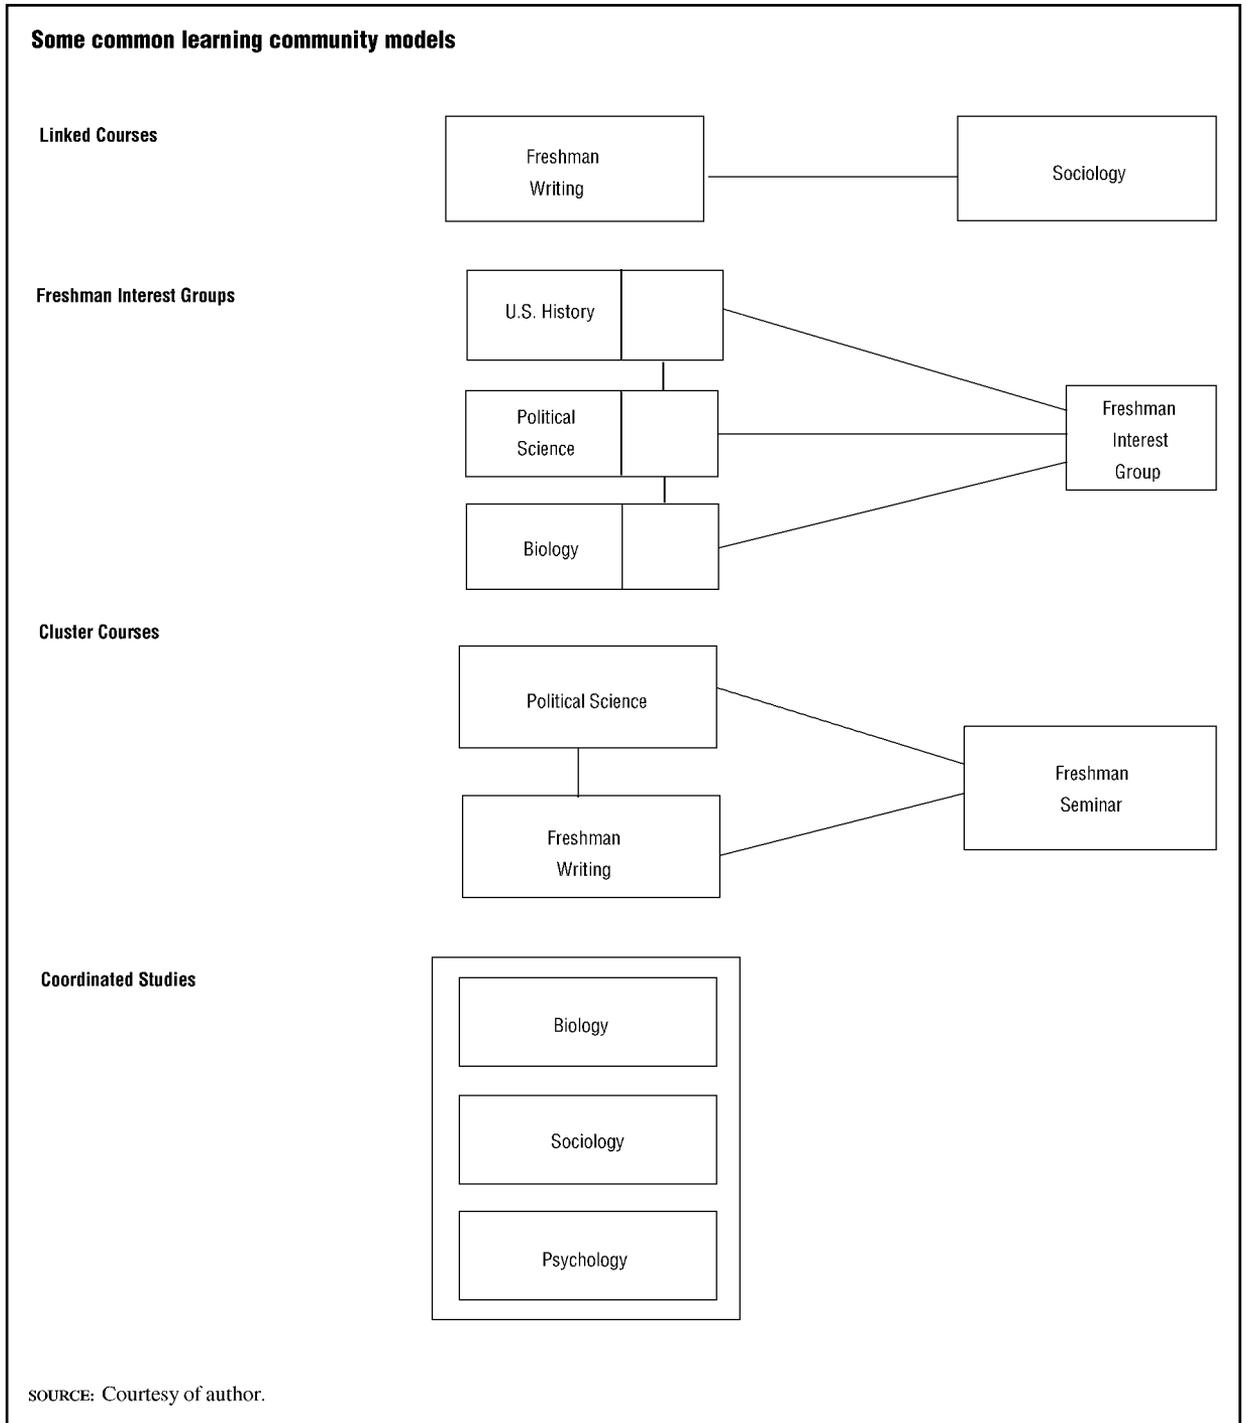

The second common element is *shared knowing*. Learning communities enroll the same students in several classes so they get to know each other quickly and fairly intimately and in a way that is part and parcel of their academic experience. By asking students to construct knowledge together, learning communities seek to involve students both socially and intellectually in ways that promote cognitive development as well as an appreciation for the many ways in which one’s own knowing is enhanced when other voices are part of that learning experience.

The third common thread is *shared responsibility*. Learning communities ask students to become responsible to each other in the process of trying to know. They participate in collaborative groups that require students to be mutually dependent on one another so that the learning of the group does not advance without each member doing her or his part.

As a curricular structure, learning communities can be applied to any content and any group of students. Most often they are designed for the needs of beginning students. In those instances, one of the linked courses becomes a Freshman Seminar. Increasingly they are also being adapted to the needs of undecided students and students who require developmental academic assistance. In these cases one of the linked courses may be a career exploration or developmental advising course or, in the latter case, a “learning to learn” or study skills course.

In residential campuses some learning communities have moved into the residence halls. These “living learning communities” combine shared courses with shared living. Students, typically those beginning their first semester of college, enroll in a

**FIGURE 1**

number of linked courses and live together in a reserved part of a residence hall.

More recently a number of institutions have used community service as a linking activity or theme for learning communities. The Evergreen

State College, Portland State University, St. Lawrence University, and colleges in the Maricopa Community College District have added service learning to one or more of their linked courses. As an extension of traditional models of community service and experiential learning, service learning combines in-

tentional educational activities with service experience to meet critical needs identified by the communities being served. Unlike voluntarism, notes Barbara Jacoby in her 1996 book on the topic, *service learning* is a pedagogical strategy; an inductive approach to education grounded in the assumption that thoughtfully organized experience is the foundation for learning. When connected to learning communities and the collaborative pedagogy that underlies them, service learning becomes a shared experience in which students and faculty are able to engage in time-intensive, interdisciplinary study of complex social problems that may be used to apply and test theory learned in the classroom or to generate knowledge from experience. In either case service learning in a collaborative setting seems to promote not only the acquisition of course content, but also enhanced intellectual development and a shared sense of responsibility for the welfare of others.

### Faculty and Staff Collaboration

When applied to particular groups of students, as described above, the faculty of the learning community almost always includes both academic and student affairs professionals. Such learning communities call for, indeed require, the collaborative efforts of both parties. This is the case because the staff of student affairs are typically the only persons on campus who possess the skills and knowledge needed to teach some of the linked courses. Take the case of learning communities for students requiring developmental assistance. In Cluster Learning Communities, for example, the faculty of the learning community may consist of a faculty person who teaches a regular introductory course in economics and two members of a learning support center who teach developmental writing and mathematics.

To be effective such learning communities require their faculty, that is the academic and student affairs professionals who staff the learning community, to collaborate on both the content and pedagogy of the linked courses. They must work together, as equal partners, to ensure that the linked courses provide a coherent shared learning experience. One of the many benefits of such collaboration, where all voices are heard, is that the academic staff often discover the wealth of knowledge that student affairs professionals bring to the discourse about teaching and learning. Furthermore, in leaving, at least momentarily, their respective “silos,” both come to discover the many benefits of looking at one’s work from fresh eyes.

### Benefits to Students

There is now ample evidence that learning communities enhance student learning and persistence in both two- and four-year institutions. Program assessments and multi-institution studies indicate that learning communities promote student achievement in a variety of ways. Though intentionally limited in scope, studies of learning communities have yielded a number of important insights into the impact of learning communities on student learning and persistence. First, students in learning communities tended to form their own self-supporting groups that extended beyond the classroom. Learning community students spent more time together out of class than did students in traditional, unrelated stand-alone classes and they did so in ways that students saw as supportive. Indeed, some students at the urban community colleges saw those groups as critical to their ability to continue in college.

Second, learning community students became more actively involved in classroom learning, even after class. They spent more time learning together both inside and outside the class. In this way, learning communities enabled students to bridge the divide between academic classes and student social conduct that frequently characterizes student life. They tended to learn and make friends at the same time. And as students spent more time together learning, they learned more.

Third, participation in the learning community seemed to enhance the quality of student learning. By learning together, everyone’s understanding and knowledge was, in the eyes of the participants, enriched. At the same time, students in the learning community programs perceived themselves as having made significantly greater intellectual gains over the course of the semester than did similar students in the comparison classes.

Fourth, as students learned more and saw themselves as more engaged both academically and socially, they persisted at a higher rate than did comparable students in the traditional curriculum. At Seattle Central Community College, for example, learning community students continued at a rate approximately twenty-five percentage points higher than did students in the traditional curriculum.

Finally, student participants’ stories highlighted powerful messages about the value of collaborative learning settings in fostering what could be called “the norms of educational citizenship,” that is to say

norms that promote the notion that individual educational welfare is tied inexorably to the educational welfare and interests of other members of the educational community. Students in these programs reported an increased sense of responsibility to participate in the learning experience, and an awareness of their responsibility for both their learning and the learning of others.

Learning communities do not represent the final answer to student learning. As with any other pedagogy, there are limits to their effectiveness. Some students do not like learning with others and some faculty find collaborating with other faculty and staff difficult. Nevertheless, like other efforts to enhance student involvement in learning, such as cooperative learning and service learning, there is ample evidence to support the contention that their application enhances student learning and persistence and enriches faculty professional lives. It is no surprise then that so many institutions have initiated learning communities and a number of foundations have established programs to support their development.

CATHERINE ENGSTROM

## LEARNING DISABILITIES, EDUCATION OF INDIVIDUALS WITH

---

The term *learning disability* was first introduced in the early 1960s. Up until that time, children with relatively normal intelligence who experienced learning difficulties were referred to as *minimally brain injured*, *slow learners*, *dyslexic*, or *perceptually disabled*. Despite their learning problems, these children had not received special attention in schools. Parents' unyielding efforts to get their children's educational needs addressed played a major role in the United States federal government's recognition of *specific learning disability* as a special education category in the late 1960s. The learning disability category has since become the largest category of special education in the United States, accounting for over half of all students identified by public schools as needing special education services.

Since the formal inception of the learning disability category in the 1960s, those working in that field have grappled with issues of definition, identifi-

cation, treatment, and placement. A definition of learning disabilities that provides unambiguous identification criteria does not yet exist; however, there is growing consensus regarding some aspects of a definition (e.g., presumption of central nervous system dysfunction; association with underachievement and psychological process disorders; variance within and among individuals). In practice, the principal method for determining identification is discrepancy: the difference between ability—usually measured by standardized intelligence tests—and achievement—usually measured by standardized achievement tests. Many authorities, however, object to the reliance on discrepancy because of invalid assumptions and unreliable scores.

Students with learning disabilities, like other students with disabilities, receive special education services under the Individuals with Disabilities Education Act (originally passed in 1975 as the Education for All Handicapped Children Act). Early attempts (i.e., in the mid-1960s to early 1970s) to alleviate the academic problems of students with learning disabilities involved a focus on perceptual motor training (e.g., tracing embedded figures, connecting dots) in isolation of academic skills. Most teachers no longer use these types of exercises, as research failed to demonstrate their effectiveness. The end result of individuals' and organizations' capitalizing on the appeal of "quick fixes" and "cures" is the emergence of other questionable treatments. In the 1980s, tinted lenses and the Neural Organization Technique—the manual manipulation of the skull—were purported to be effective treatments for severe reading problems.

Notwithstanding some ineffective methods, much progress has been made to identify effective means of addressing the learning needs of students with disabilities. Extensive research syntheses summarized by Sharon Vaughn, Russell Gersten, and David J. Chard indicate that students with learning disabilities learn best when they are taught in small groups (i.e., six or fewer), wherein teachers control tasks to ensure high levels of student success and use procedures to teach students self-questioning (e.g., What do I think this story is about? What mathematical operation should I use to solve this problem?). Best practices in writing instruction, for example, include explicit teaching of the steps in the writing process, explicit teaching of the structure of various types of writing, and guided feedback. Unfortunately, many special educators are inadequately trained

to meet the needs of exceptional students; as a result, many instructional practices validated by research are not reaching students.

The most appropriate setting in which to provide special education services is an issue of considerable debate. For most students with learning disabilities, services are provided in general education classrooms as a result of the controversial trend toward policies of inclusion (i.e., placing students with disabilities in general-education classrooms for most or all of the school day). Advocates of full inclusion, such as the Association for Persons with Severe Handicaps, declare that all students, regardless of disability, belong in general education classrooms; others, including the Learning Disabilities Association of America, advocate that decisions regarding placement should be made on an individual basis to optimize academic and social gains for students with disabilities. In accordance with the Individuals with Disabilities Education Act, a full continuum of alternative placements, ranging from general-education classrooms to home instruction, must be available to students with disabilities. To date, evidence indicates that the preservation of the continuum of placements is in the best interest of students with learning disabilities. As special educators of the twenty-first century improve teacher training and refine and replicate research efforts, the educational needs of students with learning disabilities will be met by the most qualified teachers, through the most effective means, in the most appropriate settings.

## LEARNING THEORY

### HISTORICAL OVERVIEW

Diane F. Halpern  
Beth Donaghey

### CONSTRUCTIVIST APPROACH

Mary Lamon

### SCHEMA THEORY

William F. Brewer

## HISTORICAL OVERVIEW

Learning theories are so central to the discipline of psychology that it is impossible to separate the history of learning theories from the history of psychology. Learning is a basic psychological process, and investigations of the principles and mechanisms of learning have been the subject of research and debate since the establishment of the first psychological laboratory by Wilhelm Wundt in Leipzig, Germany, in 1879. *Learning* is defined as a lasting change in behaviors or beliefs that results from experience. The ability to learn provides every living organism with the ability to adapt to a changing environment. Learning is an inevitable consequence of living—if we could not learn, we would die.

The evolution of learning theories may be thought of as a progression from broad theories developed to explain the many ways that learning occurs to more specific theories that are limited in the types of learning they are designed to explain. Learning theories are broadly separated into two perspectives. The first perspective argues that learning can be studied by the observation and manipulation of stimulus-response associations. This is known as the

*behaviorist* perspective because of its strict adherence to the study of observable behaviors. This perspective was first articulated in 1913 by John Watson, who argued that psychology should be the study of observable phenomena, not the study of consciousness or the mind. Watson believed that objective measurement of observable phenomena was the only way to advance the science of psychology.

The second type of learning theory argues that intervening variables are appropriate and necessary components for understanding the processes of learning. This perspective falls under the broad rubric of *cognitive learning theory*, and it was first articulated by Wilhem Wundt, the acknowledged “father of psychology,” who used introspection as a means of studying thought processes. Although proponents of these two perspectives differ in their view of how learning can be studied, both schools of thought agree that there are three major assumptions of learning theory: (1) behavior is influenced by experience, (2) learning is adaptive for the individual and for the species, and (3) learning is a process governed by natural laws that can be tested and studied.

### Behavior Theory

The behaviorist perspective dominated the study of learning throughout the first half of the twentieth century. Behaviorist theories identified processes of learning that could be understood in terms of the relationships between the *stimuli* that impinge on organisms and the way organisms *respond*, a view that came to be referred to as *S-R theories*. A central process in S-R theories is *equipotentiality*. Equipotential learning means that learning processes are the same for all animals, both human and nonhuman. By studying learning in nonhuman animals, the early behaviorists believed they were identifying the basic processes that are important in human learning. They also believed that learning could only be studied by observing events in the environment and measuring the responses to those events. According to the behaviorists, internal mental states are impossible topics for scientific inquiry, and thus are not necessary in the study of learning. For behaviorists, a change in behavior is the only appropriate indicator that learning has occurred. According to this view, all organisms come into the world with a blank mind, or, more formally, a *tabula rasa* (blank slate), on which the environment writes the history of learning for that organism. Learning, from the behaviorist perspective, is what happens to an organism as a result of its experiences.

**Types of behavioral learning.** There are two main types of learning in the behaviorist tradition. The first is *classical conditioning*, which is associated with the work of Ivan Pavlov (1849–1936), a Russian physiologist who studied the digestive processes of dogs. Pavlov noticed that dogs salivated in the absence of food if a particular stimulus was present that had previously been paired with the presentation of food. Pavlov investigated the way in which an association between a neutral stimulus (e.g., a lab technician who fed the dogs), an unconditioned stimulus (food), and an unconditioned reflex (salivation) was made. Pavlov’s classic experiment involved the conditioning of salivation to the ringing of a bell and other stimuli that were not likely to make a dog salivate without a previously learned association with food.

In the initial stages of the classical conditioning paradigm, an unconditioned response (UCR; in this case, salivation) is elicited by the presentation of an unconditioned stimulus (UCS; in this case, food). If a neutral stimulus (one that does not elicit the UCR, such as a bell) is paired with the presentation of the UCS over a series of trials, it will come to elicit a *conditioned* response (CR; also salivation in this example), even when the UCS (food) is absent. In the paradigm of classical conditioning, the previously neutral stimulus (bell) becomes a conditioned stimulus (CS), which produces the conditioned response (CR) of salivation. In other words, the animal in the experiment learns to associate the bell with the opportunity to eat and begins to salivate to the bell in the absence of food. It is as though the animal came to think of the bell as “mouthwatering,” although behaviorists never would have used terms like *think of*, because thinking is not a directly observable behavior.

Even though the original work on classical conditioning was performed using nonhuman animals, this type of learning applies to humans as well. Learned taste aversions and the development of specific phobias are examples of classical conditioning in humans. For example, the first time a person hears a drill at a dentist’s office, it probably will not cause the palms to sweat and the heart rate to quicken. However, through the pairing of the sound with the unpleasant sensation of having a cavity drilled, the sound itself may come to elicit symptoms of fear and anxiety, even if one is not in the dentist’s chair. Feelings of fear and anxiety may generalize so that

the same fear response is elicited by the sight of the dentist's lab coat or the dental chair.

The second type of learning that is categorized in the behaviorist tradition is *instrumental* or *operant*, conditioning. The main difference between instrumental conditioning and classical conditioning is that the emphasis is on behavior that is voluntary (emitted), not reflexive (elicited). The target behavior (e.g., a peck at a lever if one is studying birds) comes before the conditioning stimulus (e.g., food), as opposed to the classical model, which presents the conditioning stimulus (e.g., bell) prior to the target behavior (e.g., salivation).

In the instrumental paradigm, behaviors are learned as a result of their consequences. Edward Thorndike (1874–1949) was a pioneer in instrumental conditioning, although he resisted the label of *behaviorist*. In his view, the consequences of behaving in a particular way controlled learning. Behavior was instrumental in obtaining a goal, and the consequences of the behavior were responsible for the tendency to exhibit (and repeat) a behavior. Thorndike named this principle of instrumental conditioning the *law of effect*. He argued that if a behavior had a positive consequence or led to a satisfying state of being, the response (behavior) would be strengthened. If, on the other hand, a behavior had a negative consequence, the response would be weakened. Thorndike developed the principles of instrumental conditioning using a puzzle box that required that an animal exhibit a certain behavior (push a latch) to obtain a goal (open a door for access to food). The animal was given the opportunity, through trial and error, to discover the required behavior, and the behavior was reinforced through the opening of the door and access to food. With practice, the animal decreased the time that it needed to open the door. In the instrumental paradigm, the animal learned an association between a given situation and the response required to obtain a goal.

**Operant conditioning and reinforcement.** B. F. Skinner (1904–1990) is credited with the development of the operant-conditioning paradigm. Similar to instrumental conditioning, operant conditioning requires that an organism operate on the environment to achieve a goal. A behavior is learned as a function of the consequences of the behavior, according to a schedule of reinforcement or punishment. Unlike Thorndike, who used the concept of reward and satisfying states, Skinner emphasized the influence of *reinforcers*. Reinforcers are events that

follow a response and increase the likelihood that the response will be repeated, but they do not suggest the operation of a cognitive component such as reward (or pleasure). Learning is influenced according to the schedules of reinforcement in the operant paradigm. Skinner tested the operant theory by carefully controlling the environment to study behavior and the effects of reinforcement.

According to Skinner, operant conditioning has two laws. The first is the *law of conditioning*, which states that reinforcement strengthens the behavior that precedes it, which makes it more likely that the behavior will be repeated. The second is the *law of extinction*, which states that lack of reinforcement for a behavior will make that behavior less likely to reoccur. Reinforcement consists of two types of events, those that are *positive*, which means that when they are presented (e.g., present tasty food) the probability of a behavior occurring is increased (e.g., press a lever to get the tasty food), and those that are *negative*, which means that when they are removed (e.g., stop a loud sound or painful shock) the probability of a behavior occurring is increased (e.g., press a lever to stop a loud sound or painful shock). Punishment is defined as an event that weakens the tendency to make a response. Punishment could involve presenting an aversive stimulus (e.g., presenting a loud sound or painful shock), or it could involve removing access to a positive stimulus (e.g., removing a tasty food when a lever is pressed).

Skinner also experimented with different reinforcement schedules, and he found that different schedules produced different patterns of responding. Continuous schedules of reinforcement deliver a reinforcer every time the target behavior is exhibited. These schedules are effective in establishing the target behavior, but the behavior disappears quickly if the contingency is not met. Intermittent schedules of reinforcement deliver the reinforcer on a ratio schedule. For example, an experimenter may decide to reinforce every fourth response that an animal makes, or a reinforcer may be presented after a fixed or random time interval. The two types of intermittent schedules that maintain a high rate of responding and are very resistant to extinction are variable ratio and variable interval schedules.

Strict adherence to the behaviorist tradition excluded analysis of mental or internal events. However, Skinner acknowledged the role of thought. He maintained that thought was caused by events in the environment, and therefore a theory of learning that

was concerned with the influence of the environment was appropriate. Like Pavlov and Thorndike, Skinner's work was primarily conducted with non-human animals, but the principles of operant conditioning can be applied to humans as well, and they are widely used in behavior therapy and education.

### Cognitive Theories

Although behaviorism was a prolific and dominant theory in learning through the early decades of the twentieth century, certain concerns and observations led to a resurgence of interest in cognitive theories of learning. One area of concern was the distinction between performance and learning—that is, does behaviorism describe the factors that influence performance of learned behavior, rather than the act of learning itself? Within the behaviorist literature, evidence of cognitive elements like expectation and categorization exist. Under an intermittent reinforcement schedule, for example, animals increase their rate of response immediately before a reinforcer is delivered, thus acting as though they expect it. Similarly, animals can be trained to distinguish between types of stimuli that belong to different classes. Learning this type of distinction seems to involve classification, which is a cognitive process. Most importantly, scientists who studied learning recognized that the behaviorist theories could not account for all types of learning. Humans and animals can learn something without exhibiting what they have learned, meaning that performance does not always reflect what has been learned.

Cognitive theories grew from the concern that behavior involves more than an environmental stimulus and a response, whether it be voluntary or reflexive. These theories are concerned with the influence of thinking about and remembering experiences or behavior. The assumptions about learning under cognitive theories are not the same as those for behaviorist theories, because thinking and remembering are internal events. Inferences about the internal events such as thinking and remembering can be made as long as they are paired with careful observation of behavior. Cognitive theorists assume that some types of learning, such as language learning, are unique to humans, which is another difference between these two perspectives. Cognitive theories also focus on the organism as an active processor of information that modifies new experiences, relates them to past experiences, and organizes this information for storage and retrieval. Cognitive psy-

chologists also recognize that learning can take place in the absence of overt behavior.

Edward Tolman (1886–1959) was among the first psychologists to investigate the organization of behavior and learning. He conducted research in the behaviorist tradition (objective research on nonhuman species), but he introduced cognitive elements to his explanation of learning. In Tolman's theory, however, the cognitive elements were based on observed behavior, not on introspection. He believed that learning involved more than stimulus and response events; it involved the development of an organized body of knowledge or expectations about a given situation. Tolman conducted many of his learning experiments using rats whose learning task was to run through a maze. By varying the conditions in the maze, he came to the conclusion that learning involved an understanding about events and their consequences, and this led to purposive, goal-directed behavior. Tolman emphasized the role of expectation and its reinforcing influence on the repetition of behavior. He popularized the concept of cognitive maps, which represent an organism's understanding of the relationship between parts of the environment, as well as the organism's relationship to the environment.

In a clear break with behaviorists, Tolman noted that reinforcement was not a necessary component of learning, and that organisms could demonstrate *latent learning*. Latent learning is displayed only when an organism is motivated to show it. Tolman was also concerned with differences in behavior that might be attributed to internal states of the organism, a consideration that had been largely rejected by earlier theorists. In identical learning paradigms, two organisms can show different behaviors based on their different moods, physiology, or mental states.

**Social learning theory.** Social learning theory focuses on the sort of learning that occurs in a social context where modeling, or observational learning, constitutes a large part of the way that organisms learn. Social learning theorists are concerned with how expectations, memory, and awareness influence the learning process. Both humans and nonhumans can learn through observation and modeling. Consider, for example, the acquisition of sign language by the offspring of language-trained apes who learn to sign by watching their trained parents. Children learn many behaviors through modeling. A classic experiment by Albert Bandura (1961) allowed one

group of children to observe an adult who aggressively pounded on a bobo doll (an inflatable doll used for punching), while another group watched a nonaggressive model and a third group had no model at all. The children who saw the aggressive adult often modeled (imitated) this behavior when given an opportunity to play with the same doll. The children who saw the nonaggressive model showed the least amount of aggressive play when compared to the other two groups. Social learning theorists retain the behaviorist principles of reinforcement and response contingencies, but they also extend the area of inquiry for learning to include components of cognitive processing such as attention, remembering, the processing of information about the environment, and the consequences of behavior.

Appreciation of the cognitive components of learning focused attention on the need to remember an experience over various time intervals. Information-processing theories developed from the cognitive perspective and involve the processes of coding, storing, and retrieving information about the environment. Information processing is used to study the processes of memory, a central cognitive component in modern learning theories. Theories of information processing are a by-product of the computer revolution, and they use the language of computers (e.g., sequential processing stages, input, output) to describe the processes of learning and memory. According to a human information-processing perspective, learning occurs in sequential stages, beginning with *encoding* information from the environment. Encoding of information involves the process by which information from the environment is translated into usable information. The next stage is *storage*, which involves keeping the information that has been encoded. Stored information builds the “database” of past learning. The final stage in the information-processing approach is *retrieval*, which involves accessing the stored information so that it can be used to perform a task. Organisms are seen as active participants in the information-processing model. They do not experience the environment passively or simply absorb information, but instead they seek out certain information, and then manipulate, modify, and store it for later use.

Learning theories have often been used to provide a guide for education. Earlier applications were concerned with the use of appropriate rewards and punishment, concerns that mirrored the major tenets of behaviorist theories. More recently, cognitive

perspectives have shaped the field of education, and there has been more concern with learning methods that enhance long-term retention and the transfer of information and skills that are learned in schools to novel problems in out-of-school settings. For example, variability in encoding (learning material in different ways, e.g. video and text) produces more durable long-term retention, even though it is a more effortful (and generally less enjoyable) way to learn. In addition, students can become better thinkers when they receive specific instruction in thinking skills—and when the instruction is designed to enhance transfer. Teaching strategies that enhance transfer include spaced practice (viewing material over time versus cramming), using a variety of examples so learners can recognize where a concept is applicable, and practice at retrieval (repeatedly remembering material over time) with informative feedback.

Learning theories are facing new challenges as people grapple with increases in the amount of available information that needs to be learned, rapidly changing technologies that require new types of responses to new problems, and the need to continue learning throughout one’s life, even into old age. Contemporary learning theories supported by empirical research offer the promise of enhanced learning and improved thinking—both of which are critical in a rapidly changing and complex world.

## CONSTRUCTIVIST APPROACH

Constructivism is an epistemology, or a theory, used to explain how people know what they know. The basic idea is that problem solving is at the heart of learning, thinking, and development. As people solve problems and discover the consequences of their actions—through reflecting on past and immediate experiences—they construct their own understanding. Learning is thus an active process that requires a change in the learner. This is achieved through the activities the learner engages in, including the consequences of those activities, and through reflection. People only deeply understand what they have constructed.

A constructivist approach to learning and instruction has been proposed as an alternative to the objectivist model, which is implicit in all behaviorist and some cognitive approaches to education. Objec-

tivism sees knowledge as a passive reflection of the external, objective reality. This implies a process of "instruction," ensuring that the learner gets correct information.

## History of Constructivism

The psychological roots of constructivism began with the developmental work of Jean Piaget (1896–1980), who developed a theory (the theory of genetic epistemology) that analogized the development of the mind to evolutionary biological development and highlighted the adaptive function of cognition. Piaget proposed four stages in human development: the sensorimotor stage, the preoperational stage, the concrete operational stage, and the formal operational stage. For Piaget, the development of human intellect proceeds through adaptation and organization. Adaptation is a process of assimilation and accommodation, where external events are assimilated into existing understanding, but unfamiliar events, which don't fit with existing knowledge, are accommodated into the mind, thereby changing its organization.

Countless studies have demonstrated—or tried to discredit—Piaget's developmental stages. For example, it has become clear that most adults use formal operations in only a few domains where they have expertise. Nonetheless, Piaget's hypothesis that learning is a transformative rather than a cumulative process is still central. Children do not learn a bit at a time about some issue until it finally comes together as understanding. Instead, they make sense of whatever they know from the very beginning. This understanding is progressively reformed as new knowledge is acquired, especially new knowledge that is incompatible with their previous understanding. This transformative view of learning has been greatly extended by neo-Piagetian research.

The Russian psychologist Lev Vygotsky's (1896–1934) relevance to constructivism derives from his theories about language, thought, and their mediation by society. Vygotsky held the position that the child gradually internalizes external and social activities, including communication, with more competent others. Although social speech is internalized in adulthood (it becomes thinking), Vygotsky contended that it still preserves its intrinsic collaborative character.

In his experiments, Vygotsky studied the difference between the child's reasoning when working in-

dependently versus reasoning when working with a more competent person. He devised the notion of the *zone of proximal development* to reflect on the potential of this difference. Vygotsky's findings suggested that learning environments should involve guided interactions that permit children to reflect on inconsistency and to change their conceptions through communication. Vygotsky's work has since been extended in the *situated approach* to learning.

Vygotsky and Piaget's theories are often contrasted to each other in terms of individual cognitive constructivism (Piaget) and social constructivism (Vygotsky). Some researchers have tried to develop a synthesis of these approaches, though some, such as Michael Cole and James Wertsch, argue that the individual versus social orientation debate is over-emphasized. To them, the real difference rests on the contrast between the roles of cultural artifacts. For Vygotsky, such artifacts play a central role, but they do not appear in Piaget's theories.

For the American philosopher and educator John Dewey (1859–1952), education depended on action—knowledge and ideas emerge only from a situation in which learners have to draw out experiences that have meaning and importance to them. Dewey argued that human thought is practical problem solving, which proceeds by testing rival hypotheses. These problem-solving experiences occur in a social context, such as a classroom, where students join together in manipulating materials and observing outcomes. Dewey invented the method of progressive education in North America. The Fostering Communities of Learners (FCL) program, devised by Ann Lesley Brown and Joseph Campione, is a current attempt to put Dewey's progressive education theory to work in the classroom.

In summary, Piaget contributed the idea of transformation in learning and development; Vygotsky contributed the idea that learning and development were integrally tied to communicative interactions with others; and Dewey contributed the idea that schools had to bring real world problems into the school curriculum.

### Constructivist Processes and Education

There are a number of competing constructivist views in education. Constructivists tend to celebrate complexity and multiple perspectives, though they do share at least a few educational prescriptions.

**Prior knowledge.** Constructivists believe that prior knowledge impacts the learning process. In trying to

solve novel problems, perceptual or conceptual similarities between existing knowledge and a new problem can remind people of what they already know. This is often one's first approach towards solving novel problems. Information not connected with a learner's prior experiences will be quickly forgotten. In short, the learner must actively construct new information into his or her existing mental framework for meaningful learning to occur.

For example, Rosalind Driver has found that children's understanding of a phenomenon (interpretations that fit their experiences and expectations) differ from scientific explanations. This means that students distinguish school science from their "real world" explanations. Studies of adult scientific thinking reveal that many adults hold non-normative scientific explanations, even though they have studied science. This is what the philosopher Alfred Whitehead (1861–1947) referred to as *inert knowledge*. Asking students what they already know about a topic and what puzzles them affords an opportunity to assess children's prior knowledge and the processes by which they will make sense of phenomena.

**Real and authentic problems.** Constructivist learning is based on the active participation of learners in problem-solving and critical thinking—given real and authentic problems.

In *anchored instruction*, for example, as advanced in the work of the Cognition and Technology Group at Vanderbilt University, learners are invited to engage in a fictitious problem occurring in a simulated real-world environment. Rich and realistic video contexts are provided—not only to provide relevant information for solving the problem, but also to create a realistic context. If the students buy in to the proposed problems, they will be engaged in problem solving similar to what the people in the video are engaged in.

There are also many examples of project-based learning in which students take on tasks such as building a vehicle that could cross Antarctica. It is unclear whether these constitute authentic problems—or what students learn from project-based learning.

**Constructivist curriculum.** A constructively oriented curriculum presents an emerging agenda based on what children know, what they are puzzled by, and the teachers' learning goals. Thus, an important part of a constructivist-oriented curriculum

should be the negotiation of meaning. Maggie Lampert, a mathematics teacher, guides students to make sense of mathematics by comparing and resolving discrepancies between what they know and what seems to be implied by new experience.

In constructivist classrooms, curriculum is generally a process of digging deeper and deeper into big ideas, rather than presenting a breadth of coverage. For example, in the Fostering Communities of Learners project where students learn how to learn, in knowledge-building classrooms where students seek to create new knowledge, or in Howard Gardner's classrooms where the focus is on learning for deep understanding, students might study endangered species, island biogeography, or the principles of gravity over several months. As students pursue questions, they derive new and more complex questions to be investigated. Building useful knowledge structures requires effortful and purposeful activity over an extended period.

**Cognitive conflict and social context.** According to Dewey, "Reflection arises because of the appearance of incompatible factors within an empirical situation. Then opposed responses are provoked which cannot be taken simultaneously in overt action" (p. 326). To say this in another way, cognitive conflict or puzzlement is the stimulus for learning, and it determines the organization and nature of what is being learned. Negotiation can also occur between individuals in a classroom. This process involves discussion and attentive listening, making sense of the points of views of others, and comparing personal meanings to the theories of peers. Justifying one position over another and selecting theories that are more viable leads to a better theory. Katerine Bielaczyc and Allan Collins have summarized educational research on learning communities in classrooms where the class goal is to learn together, to appreciate and capitalize on distributed expertise, and to articulate the kinds of cognitive processes needed for learning.

**Constructivist assessment.** Assessment of student learning is of two types: formative and summative. Formative assessment occurs during learning and provides feedback to the student. It includes evaluations of ongoing portfolios, and demonstrations of work in progress. Student collaboration also provides a form of formative assessment. In FCL, for example, students report to each other periodically on their research. In knowledge-building classrooms, students can read and comment on each other's

work with the Knowledge Forum software. Formative assessment rarely occurs in classrooms.

Summative assessment occurs through tests and essays at the end of a unit of study. Summative assessments provide little specific feedback. From a constructivist perspective, formative assessments are more valuable to the learner, but with the recent emphasis in North America on standards, and due to the poor alignment of constructivist approaches and standards, it is very difficult to harmonize formative and summative assessments.

**Technology and constructivism.** Cognitive research has uncovered successful patterns in tutorial, mentoring, and group discussion interactions. However, typical Internet chat and bulletin-board systems do not support a constructivist approach to learning and instruction. During the 1990s, researchers created tools such as Knowledge Forum, the Knowledge Integration Environment, and CoVis to more fully address constructivist principles. Each of these tools invites collaboration by structuring the kinds of contributions learners can make, supporting meaningful relationships among those contributions, and guiding students' inquiries. Teachers who use information and communication technologies in their classrooms are more likely to have a constructivist perspective towards learning and instruction. Additionally, sophisticated information and technology communications tools can capture the cognitive processes learners engage in when solving problems. This affords teacher reflection and coaching to aid deeper learning. It also affords teachers the chance to learn from each other.

**The teacher's role.** The teacher's role in a constructivist classroom isn't so much to lecture at students but to act as an expert learner who can guide students into adopting cognitive strategies such as self testing, articulating understanding, asking probing questions, and reflection. The role of the teacher in constructivist classrooms is to organize information around big ideas that engage the students' interest, to assist students in developing new insights, and to connect them with their previous learning. The activities are student-centered, and students are encouraged to ask their own questions, carry out their own experiments, make their own analogies, and come to their own conclusions. Becoming a constructivist teacher may prove a difficult transformation, however, since most instructors have been prepared for teaching in the traditional, objectivist manner. It "requires a paradigm shift," as well as

“the willing abandonment of familiar perspectives and practices and the adoption of new ones” (Brooks and Brooks, p. 25).

A constructivist approach to education is widely accepted by most researchers, though not by all. Carl Bereiter argues that constructivism in schools is usually reduced to project based learning, and John Anderson, Lynn Reder, and Herbert Simon claim that constructivism advocates very inefficient learning and assessment procedures. In any event, the reality is that constructivism is rarely practiced in schools.

## SCHEMA THEORY

Schemata are psychological constructs that have been proposed as a form of mental representation for some forms of complex knowledge.

### Bartlett's Schema Theory

Schemata were initially introduced into psychology and education through the work of the British psychologist Sir Frederic Bartlett (1886–1969). In carrying out a series of studies on the recall of Native American folktales, Bartlett noticed that many of the recalls were not accurate, but involved the replacement of unfamiliar information with something more familiar. They also included many inferences that went beyond the information given in the original text. In order to account for these findings, Bartlett proposed that people have *schemata*, or unconscious mental structures, that represent an individual's generic knowledge about the world. It is through schemata that old knowledge influences new information.

For example, one of Bartlett's participants read the phrase "something black came out of his mouth" and later recalled it as "he foamed at the mouth." This finding could be accounted for by assuming that the input information was not consistent with any schema held by the participant, and so the original information was reconstructed in a form that was consistent with one of the participant's schemata. The schema construct was developed during the period when psychology was strongly influenced by behaviorist and associationistic approaches; because the schema construct was not compatible with these worldviews, it eventually faded from view.

### Minsky's Frame Theory

In the 1970s, however, the schema construct was re-introduced into psychology through the work of the

computer scientist Marvin Minsky. Minsky was attempting to develop machines that would display human-like abilities (e.g., to perceive and understand the world). In the course of trying to solve these difficult problems, he came across Bartlett's work. Minsky concluded that humans were using their stored knowledge about the world to carry out many of the processes that he was trying to emulate by machine, and he therefore needed to provide his machines with this type of knowledge if they were ever to achieve human-like abilities. Minsky developed the *frame* construct as a way to represent knowledge in machines. Minsky's frame proposal can be seen as essentially an elaboration and specification of the schema construct. He conceived of the frame knowledge as interacting with new specific information coming from the world. He proposed that fixed generic information be represented as a frame comprised of slots that accept a certain range of values. If the world did not provide a specific value for a particular slot, then it could be filled by a default value.

For example, consider the representation of a generic (typical) elementary school classroom. The frame for such a classroom includes certain information, such as that the room has walls, a ceiling, lights, and a door. The door can be thought of as a slot which accepts values such as wood door or metal door, but does not accept a value such as a door made of jello. If a person or a machine is trying to represent a particular elementary school classroom, the person or machine *instantiates* the generic frame with specific information from the particular classroom (e.g., it has a window on one wall, and the door is wooden with a small glass panel). If, for some reason, one does not actually observe the lights in the classroom, one can fill the lighting slot with the default assumption that they are fluorescent lights. This proposal gives a good account of a wide range of phenomena. It explains, for example, why one would be very surprised to walk into an elementary classroom and find that it did not have a ceiling, and it accounts for the fact that someone might recall that a certain classroom had fluorescent lights when it did not.

### Modern Schema Theory

Minsky's work in computer science had a strong and immediate impact on psychology and education. In 1980 the cognitive psychologist David Rumelhart elaborated on Minsky's ideas and turned them into

an explicitly psychological theory of the mental representation of complex knowledge. Roger Schank and Robert Abelson developed the *script* construct to deal with generic knowledge of sequences of actions. Schema theory provided explanations for many experiments already in the literature, and led to a very wide variety of new empirical studies. Providing a relevant schema improved comprehension and recall of opaquely written passages, and strong schemata were shown to lead to high rates of inferential errors in recall.

### Broad versus Narrow Use of Schema

In retrospect, it is clear that there has been an ambiguity in schema theory between a narrow use and a broad use of the term *schema*. For example, in Rumelhart's classic 1980 paper, he defined a schema as "a data structure for representing the generic concepts stored in memory" (p. 34). Yet he went on to state that "there are schemata representing our knowledge about all concepts: those underlying objects, situations, events, sequences of events, actions and sequences of actions" (p. 34). Thus, schemata are frequently defined as the form of mental representation for generic knowledge, but are then used as the term for the representation of all knowledge.

There are severe problems with the use of the term *schema* to refer to all forms of complex knowledge. First, there is no need for a new technical term, since the ordinary term *knowledge* has this meaning. In addition, if schema theory is used to account for all knowledge, then it fails. A number of writers have pointed out that schema theory, as presently developed, cannot deal with those forms of knowledge that do not involve old generic information. Thus, schema theory provides an account for the knowledge in long-term memory that the state of Oklahoma is directly above the state of Texas. However, schema theory does not provide an account of the new representation one develops of a town as one travels through it for the first time.

Therefore it seems best to use the term *schema* in the narrower usage, as the form of mental representation used for generic knowledge. However, if one adopts the narrower usage one has to accept that schemata are only the appropriate representations for a subset of knowledge and that other forms of mental representation are needed for other forms of knowledge. For example, *mental models* are needed to represent specific nonschematic aspects of knowledge, such as the layout of an unfamiliar town, while

*naive theories* or *causal mental models* are needed to represent knowledge of causal/mechanical phenomena.

### Schema Theory in Education

Richard Anderson, an educational psychologist, played an important role in introducing schema theory to the educational community. In a 1977 paper Anderson pointed out that schemata provided a form of representation for complex knowledge and that the construct, for the first time, provided a principled account of how old knowledge might influence the acquisition of new knowledge. Schema theory was immediately applied to understanding the reading process, where it served as an important counterweight to purely bottom-up approaches to reading. The schema-theory approaches to reading emphasize that reading involves both the bottom-up information from the perceived letters coming into the eye and the use of top-down knowledge to construct a meaningful representation of the content of the text.

### Broad versus Narrow Use of Schema in Education

The problem with the broad and narrow use of the term *schema* surfaced in education just as it had in cognitive psychology. For example, in Anderson's classic 1977 paper on schemata in education, he clearly takes the broad view. He attacks the narrow view and says that it is impossible "that people have stored a schema for every conceivable scene, event sequence, and message" (p. 421), and that "an adequate theory must explain how people cope with novelty" (p. 421). However in a paper written at roughly the same time (1978), Anderson states that "a schema represents generic knowledge" (p. 67), and he adopts the narrow view systematically throughout the paper. In a 1991 paper on terminology in education, Patricia Alexander, Diane Schallert, and Victoria Hare note that the systematic ambiguity between the narrow and broad views has made it very difficult to interpret a given writer's use of the term *schema* in the education literature.

### Instructional Implications of Schema Theory

A number of writers have derived instructional proposals from schema theory. They have suggested that relevant knowledge should be activated before reading; that teachers should try to provide prerequisite knowledge; and that more attention should be given

to teaching higher-order comprehension processes. Many of these proposals are not novel, but schema theory appears to provide a theoretical and empirical basis for instructional practices that some experienced teachers were already carrying out.

### Impact of Schema Theory on Education

Schema theory has provided education with a way to think about the representation of some forms of complex knowledge. It has focused attention on the role old knowledge plays in acquiring new knowledge, and has emphasized the role of top-down, reader-based influences in the reading process.

## LEARNING TO LEARN AND METACOGNITION

---

Since the time of the Greek philosopher Socrates, educators have realized that teachers cannot possibly teach students everything they need to know in life. Thus, a major goal of educational systems has been to prepare students for a lifetime of learning. To this end, a large part of the educational endeavor involves teaching general skills and strategies that can be applied to a variety of problems and learning situations.

Although strategy instruction has been shown to improve learning, knowledge of strategies may not be sufficient to produce higher levels of learning. For instance, in 1973 Earl C. Butterfield, Clark Wambold, and John M. Belmont taught learning disabled students a strategy for learning a list of items. When these students used the strategy, their performance reached the level of normal achieving students—however, the learning disabled students did not spontaneously use it. To obtain higher levels of performance, learning disabled students had to be told when to use the strategy.

Similarly, young children may have knowledge of strategies but fail to use them. Michael Pressley, John G. Borkowski, and Julia T. O'Sullivan suggested in 1984 that strategy instruction should therefore provide students information about the utility of the strategy and when and how to use it. Put differently, strategy instruction should also include a metacognitive component.

Metacognition broadly defined is knowledge that a person has of his own cognitive processes. In 1979 John H. Flavell proposed that metacognitive knowledge consists of three components: (1) knowledge of self (e.g., knowing that one learns better when studying in a quiet setting than in front of the television); (2) knowledge of task (e.g., knowing that it's easier to prepare for a multiple-choice test than an essay test); and (3) knowledge of strategies (e.g., when and how to use them).

There is a significant relation between learning outcomes and knowledge of specific strategies. For instance, when strategy-training programs include assessing knowledge of the strategy and the utility of the strategy being taught, test performance is greater for children with more knowledge of the strategy than for children with less knowledge. Thus, knowing about a strategy is important. It is also important to know when to use one strategy versus another.

Ideally, children will be able to monitor the effectiveness of a particular strategy in a given situation and change strategies if necessary. To do this, they must accurately monitor their own learning (the degree to which material has been learned). Models of self-regulated learning provide a theoretical framework for understanding the role of metacognition in learning.

These models suggest that a person begins study by setting a learning goal (desired state of learning). As a person studies, she monitors how well the material has been learned. If this monitoring indicates that the goal has been reached, the person will terminate study. By contrast, if the learning goal has not been reached, the person will adjust her study (e.g., selecting a different study strategy or allocating more study time to the material).

According to this framework, accurate metacognitive monitoring is necessary for effective regulation of study, and these together contribute to more optimal learning. Thus, if a person does not accurately monitor his current state of learning, the person may fail to regulate study effectively. For instance, if a person inaccurately assesses progress toward a learning goal, he may prematurely stop studying or may continue using a less-effective strategy when another would be more effective. Therefore, accurately monitoring learning is critical.

A number of factors affect how accurately learning is monitored and how well this information is used to regulate study. Age-related differences are perhaps most relevant to educators. The capability to monitor the effectiveness of one strategy versus another develops with age. Adults discover the utility of a strategy spontaneously by using the strategy and through experiences with tests, and they will use this information to regulate subsequent study—selecting more effective strategies. Older children, although less accurate than adults, also monitor the utility of a particular strategy by using it and gaining feedback through tests; however, they fail to use this information to regulate study without explicit feedback regarding test performance. Young children do not appear to accurately monitor the utility of a strategy even when given an opportunity to monitor their test performance.

One approach to improving the accuracy of monitoring strategy effectiveness is to provide strategy-monitoring training. Marguerite Lodico and colleagues in 1983 trained young children to moni-

tor their performance while using different strategies and to explain how the strategy influenced their performance. Throughout this training, the children received feedback regarding their answers. Children who received this training were better able to derive the utility of the strategies and, in subsequent study, more frequently chose to use the more effective strategy.

The capability to monitor learning during study (prior to test) also develops with age. Annette Dufresne and Akira Kobasigawa showed that children as young as third grade recognized that it was easier to learn related items (e.g., bat and ball) than unrelated items (e.g., frog and table), whereas first graders fail to monitor the difference between these items. This difference in monitoring accuracy influenced regulation of study. Older children chose to restudy the more difficult items, whereas younger children appeared to randomly select items for restudy.

In some cases, adults quite accurately monitor their own learning (e.g., when monitoring associative learning after a delay). That is, in these situations, adults accurately discriminate better-learned material from less-learned material. However, in other cases, such as attempting to monitor comprehension of texts, even adult's monitoring accuracy is less than remarkable. Nonetheless, adults use this monitoring to guide subsequent study, typically opting to restudy material perceived as less well learned over material perceived as better learned. Moreover, monitoring accuracy is related to learning—higher accuracy is associated with greater test performance.

These findings regarding the importance of monitoring lead to the question of how educators can improve monitoring accuracy. First, they can encourage students to assess their own learning. As noted above, strategy-monitoring training involves giving students practice at monitoring the effectiveness of strategies. With practice, students also become more accurate at discriminating better-learned material from less-learned material. Second, they can frequently test student learning and provide explicit feedback on performance. Tests and feedback related to performance helps at least older students monitor the effectiveness of strategies. Tests also help students monitor their learning.

Learning to learn requires that students accurately monitor the effectiveness of their study and problem-solving behavior. Higher-achieving stu-

dents engage in more self-assessment than lower-achieving students. By encouraging self-assessment and developing monitoring skills in students, teachers can provide students with skills that will help them well after they leave the classroom.

### LIABILITY OF SCHOOL DISTRICTS AND SCHOOL PERSONNEL FOR NEGLIGENCE

A tort is a civil wrong—a violation of a duty—that causes harm. In the U.S. judicial system, an individ-

ual who is injured by a breach of duty can sue the other person to collect compensation for that injury. There are basically three types of civil wrongs.

- **Intentional torts** include trespass, assault, battery and defamation.
- **Unintentional torts** include negligence and strict liability. Strict liability is when someone is held liable, even though they are not at fault. It is often used when an individual is engaged in an ultrahazardous activity.
- **Constitutional torts** occur when a government agent has violated an individual's constitutional rights.

Some intentional torts also can be crimes, and a tort-feasor can be required by a civil court to pay money damages to compensate the injured person and also be required by a criminal court to pay a fine or suffer imprisonment.

Negligence differs from these in that it is an unintentional tort. It occurs when one person unintentionally causes an injury to another through a breach of a duty or violation of a general standard of care. The general standard of conduct is conduct that reasonable people may expect others to observe as they go about their daily lives. Negligence is the failure to exercise due care when carrying out a duty or subjecting another to a risk that causes harm. A negligent tort is a tort that, although not intended, was committed in disregard of the rights or reasonable expectations of another person. This is the area of tort law that has given rise to the most litigation.

The money a tort-feasor must pay to compensate the accuser for the harm the accuser has sustained is called damages. Factors for which money damages are awarded in a tort case include property damage, medical expenses, pain and suffering, and lost wages. If the conduct of the tort-feasor is a particularly outrageous or offensive violation of the reasonable standard of conduct expected, the civil court will add to its award of regular damages to the injured person and amount of money known as exemplary, or punitive, damages. The damages constitute a civil, or private, fine against the tort-feasor and are analogous to the fines imposed by a criminal court.

The sixth edition of *Black's Law Dictionary* defines *negligence* as "the omission to do something which a reasonable man, guided by those ordinary considerations which ordinarily regulate human affairs, would do, or the doing of something which a reasonable or prudent man would not do."

Schools and their employees are not automatically responsible for every injury that may occur within the school. In order to be held liable for negligence, the following four questions must be answered in the affirmative:

1. Did the defendant owe a duty to the plaintiff?
2. Did the defendant breach that duty?
3. Was the plaintiff injured?
4. Was the breach the proximate cause of the injuries?

Further, there can be no defenses to the action. Generally speaking, to recover damages, it must be shown that the defendant owes a duty to the injured person, that the behavior fell short of that required, that this caused a real injury to the person, and that the injured person was not responsible for causing the injury.

### Duty

There is a duty of due care that the law recognizes one person owes to another. This duty may arise from a contract, a statute, common sense, or a special relationship the parties have to one another. Regarding students, the courts have found that schools and their employees have the duty to supervise students, provide adequate and appropriate instruction prior to commencing an activity that may pose a risk of harm, and provide a safe environment. Usually, that duty extends to students while they are in the custody or control of the school. Schools may have a duty to supervise students off school grounds when they have caused them to be there such as while on field trips or extracurricular events.

Schools may have a duty to supervise students on school grounds before and after school when they have caused them to be there, for example, when the bus drops them off. A duty can be extended if a person assumes additional responsibilities, such as assuming the duty to supervise students before and after school. Schools may acquire a duty to supervise when they have, by their previous actions, assumed the duty to supervise at this time such as when some staff has supervised intermittently or consistently before official time to arrive.

Schools also have a duty to warn of known dangers even when they do not have a duty to supervise. In the general workforce, a supervisor, and ultimately the company, is responsible for the negligent acts of employees under the doctrine of *respondeat supe-*

*rior*. However, in education, generally no one is automatically responsible for the acts of another. School administrators are not automatically responsible for the negligent acts of teachers. In school situations, usually a plaintiff must find a separate duty on the part of each defendant.

### Breach of Duty

Once a duty has been established, the injured individual must show that the duty was breached. The duty has been breached when the individual unreasonably fails to carry out the duty.

In carrying out duties, one is expected to act as an ordinary, prudent, and reasonable person considering all of the circumstances involved. The court or jury makes a determination of how the reasonable person would have acted; if the individual did less, he or she is found negligent.

The standard varies for professionals; for example, a reasonable teacher or principal. Defendants who are professionals will be held to a standard based on the skills or training they should have acquired for that position. Thus, the question to be answered is: What would the reasonable professional have done under the same or similar circumstances?

The standard varies also with the individual circumstances of the situation. Each situation gives rise to a unique set of circumstances. Some of the factors which may be considered in determining the standard of care include the following:

- Age and maturity
- Nature of the risk
- Precautions taken to avoid injury
- Environment and context (including characteristics of students, location, physical characteristics, and so forth)
- Type of activity
- Previous practice and experience

In determining negligence, children are not held to the same standard of care as adults; instead their actions must be reasonable for a child of similar age, maturity, intelligence, and experience. Some states further classify children according to a presumption of capabilities. In those states, children under seven are not held responsible for negligence or unreasonable acts. The noted exception, however, is that a child may be held to an adult standard of care when engaged in an adult activity, for example, driving a car or handling a weapon.

## Injury

The plaintiff must show an actual loss or real damage, for instance a physical bodily injury or a real loss. Compensation may include direct monetary damages for medical expenses, replacement of property, lost wages, and so forth.

The plaintiff may recover also for intangible injuries, such as pain and suffering, and emotional distress. In some situations an intangible injury is sufficient for recovery. However, there are states that require at least a physical manifestation of an injury if there are no tangible injuries.

## Causation

To recover for an injury, the plaintiff must show that the defendant's negligence was the cause of the injury. If the accident would have occurred anyway, there can be no liability.

The defendant's negligent act must be a continuous and active force leading up to the actual harm. When there is a lapse of time between the defendant's negligence and the injury, other contributing causes and intervening factors may be the actual cause of the injury.

When there is a series of events leading up to an injury, the person starting that chain of events may be liable for the resultant injury if it was a foreseeable result of his negligence. If the injury at the end of the chain of events was not a logical (foreseeable) result of the negligence, there is no liability.

When another independent act occurs in between the defendant's negligent act and the plaintiff's injury, it may cut off the liability. In other words, someone else's actions may have been the cause of the injury. Intervening acts will not cut off liability when those intervening acts were foreseeable.

## Defenses

Once the basic elements have been established, the court looks to the possibility of defenses before a damage award is granted. Defenses vary greatly between states; the most common defenses being governmental immunity; assumption of the risk; and comparative or contributory negligence.

In states that still have strict governmental immunity, an individual may not bring legal action against the state. In these states, immunity is a complete bar to an action. Governmental immunity has

greatly eroded in recent years, generally allowing an individual to recover for injuries, but not allowing an action that would undermine the state's decision-making power when carrying out its state or official functions. Governmental actions are those the state undertakes as a policymaker. Thus, an individual is not allowed to sue the school for an injury caused by a policy decision such as making a curriculum choice or setting the date and time for school to start. Some states have abrogated sovereign immunity up to a particular dollar limit or to the extent of insurance coverage. These states usually have strict notice and pleading requirements at the outset of a legal action.

Assumption of the risk is also an affirmative defense that, if successful, presents a complete bar to plaintiff's recovery. This defense is based on the idea that if the plaintiff knowingly and voluntarily accepted the risks of an activity, he or she should not be allowed to recover for injuries caused by those known risks. For knowing acceptance to occur, it is important that all risks inherent in an activity are apparent or explained and that they are voluntarily assumed.

Students in athletic activities are asked to assume the risk of playing that sport. It must be shown that the plaintiff understood how the specific activity was dangerous and nonetheless voluntarily engaged in it. Students should be told of the risks of injury during the regular course of play; therefore if an injury were to occur, the school would not be responsible.

Many people mistakenly believe that parents assume all risks for their children when they sign permission slips. While the parents may assume the normal risks associated with the activity, they do not waive their rights for any and all injuries that may occur. They cannot assume risks of which they have no knowledge. In sum, some permission slips are worthless in terms of waiving liability. They often only serve to provide parents an opportunity to opt their children out of certain activities.

The defenses of contributory and comparative negligence offer a complete bar or a reduction in the damage award due to the plaintiff being partially responsible for his or her own injuries. Making this determination is similar to making the determination of the defendant's negligence—did the plaintiff fail to exercise reasonable care, which resulted in the injury. Contributory negligence is a total bar from

recovery. Under contributory negligence, if the plaintiff is responsible for the injuries sustained in any way, no matter how slight, he or she cannot be awarded any damages. Recognizing that this all-or-nothing approach often results in severe consequences, most states have moved to the less severe system of comparative negligence.

In comparative negligence, the damage award is apportioned depending on the degree of fault or contribution to the injuries. Comparative negligence is distinguished between pure and modified forms. Pure comparative negligence allows the plaintiff to recover any amount of damages for which the defendant was negligent. In states that have adopted a modified comparative negligence, damages are awarded only if the defendant's negligence is greater than that of the plaintiff. In the early twenty-first century, a majority of states operate within some type of comparative negligence system.

### Malpractice

As in medical malpractice, the term *educational malpractice* refers to negligence on the part of a professional. However, the courts have not recognized educational malpractice as a cause of action for damages. The seminal case is *Peter W. v. San Francisco Unified School District* (1976). Here the student was graduated from high school while still being illiterate. The court found no legal duty on which to base an action against the school district. Further, it concluded that there was no workable standard of care for teaching against which the defendant's actions could be judged. Finally, the court noted that the degree of certainty that the plaintiff had suffered any injury, the extent of the injury, and the establishment of a causal link between defendant's conduct and the plaintiff's injuries were uncertain. The primary motive for courts not recognizing educational malpractice as a cause of action is generally public policy. The concern typically expressed is that recognition of this cause of action would require the courts to make judgments on the validity of educational policies. Additionally, court have noted there are other, more appropriate avenues of relief if an individual is dissatisfied with the public schools, such as individual administrative review and school board elections.

## LIBERAL ARTS COLLEGES

---

Rather than emphasizing a specific course of study or professional training, liberal arts colleges aim to expose students to a wide breadth of courses in the humanities and both physical and social sciences. Although the curriculum varies from college to college, a student's coursework at a liberal arts school would include many or all of the following subjects: history, philosophy, religion, literature, physical sciences (e.g., biology, chemistry, physics), social sciences (e.g., psychology, sociology, economics, politics), the arts (e.g., theater, music, art), languages, and mathematics. Liberal arts colleges tend to stress the importance of teaching by faculty and usually have smaller enrollments.

The Carnegie Classification of Institutions of Higher Education is a typology of colleges and universities in America that orders colleges and universities by category. Within the Carnegie Classification system there is a separate and distinct category for liberal arts colleges called "Baccalaureate Colleges—Liberal Arts." Baccalaureate Colleges—Liberal Arts are identified as institutions that "are primarily undergraduate colleges with major emphasis on baccalaureate programs. During the period studied, they awarded at least half of their baccalaureate degrees in liberal arts fields" (Carnegie Foundation for the Advancement of Teaching website). There are 228 liberal arts institutions, which comprise 15.4 percent of all colleges and universities in the United States. Of these 228 colleges and universities twenty-six are public institutions, comprising 15 percent of this category, and 202 are private not-for-profit institu-

tions, comprising 88.6 percent of this category. There are no private for-profit liberal arts institutions. Clearly, private liberal arts colleges outnumber public liberal arts colleges in the United States.

### History of Liberal Arts Colleges

American universities began with the founding of Harvard in 1636, which was modeled after Emmanuel College at Cambridge University. After the founding of Harvard and into the early 1800s, several colleges were founded. These colleges, like Harvard, were small, religiously affiliated institutions. Appropriate curriculum for these colleges became widely debated in the early part of the nineteenth century. As science and technology became more prevalent and began to shape the world, American society called upon its colleges to provide coursework that suited the new era. In reply to these demands, Yale President Jeremiah Day organized a committee to address the aforementioned debates. The resultant document was “The Yale Report of 1828.”

“The Yale Report of 1828” called for breadth in curriculum as the writers of the document doubted “whether the powers of the mind can be developed, in their fairest proportions, by studying languages alone, or mathematics alone, or natural or political science alone” (p. 173). The document further states that “the course of instruction which is given to undergraduates in the college is not designed to include professional studies. Our object is not to teach what is peculiar to any one of the professions; but to lay the foundation which is common to them all” (p. 173). Since its publication, “The Yale Report of 1828” has become the classic argument for a liberal education and liberal arts colleges in the United States.

In the mid-nineteenth century, Americans began traveling to Germany to obtain their Ph.D.s. The influx of German-educated scholars into the United States bought a new model for the American college, and created what is now the research university. During this same time, land-grant colleges and technical schools began to develop in the United States. All three of these new types of colleges were focused on specific training, and therefore were antithetical to the liberal arts college. Many of the colleges that were founded on ideals closer to those of liberal arts colleges (e.g. Harvard, Yale, Princeton) became research universities. Other colleges pur-

posefully chose to remain small and committed to a liberal education.

Over time the American liberal arts college has become a small part of the American higher education system. Yet the liberal arts college is flourishing at the beginning of the twenty-first century. Perhaps this is because the liberal arts college is unique in character or perhaps because of the unique character of the students that the liberal arts college produces.

### Characteristics of Liberal Arts Colleges

At the heart of the liberal arts colleges are their missions. Most mission statements of liberal arts colleges endeavor to educate the whole student and emphasize education for its own sake rather than for job preparation. Liberal arts colleges tend to be small and private. Many liberal arts colleges have total enrollments of less than 2,000 students with low student-to-teacher ratios. They are also usually residential and value the idea of community. The liberal arts college is invested in teaching, and students and professors often collaborate with one another in the learning process. Oscar Paige, the president of Austin College, characterized the liberal arts college by saying:

The residential nature of our college and of many liberal arts colleges is unique and adds to the value of the educational experience. The liberal arts community is a community that encourages inquiry and investigation and as a result students are challenged to think “outside the box” more on this type of campus than in other settings. Critical thinking, innovation, interdisciplinary curriculum and personal interaction with faculty all characterize this type of institution. (personal communication with author)

Most liberal arts colleges in the United States were founded by various religious dominations. For example, there are colleges founded by Lutherans (e.g., St. Olaf College, Luther College), Baptists (e.g., Arkansas Baptist College), and Presbyterians (e.g., Rhodes College, St. Andrews Presbyterian College). Many of these colleges have maintained strong religious affiliations into the twenty-first century. Many others maintain links with the church that founded the institution, but have a limited religious presence on campus. Some liberal arts colleges have abandoned all former religious ties.

Liberal arts colleges are often innovative in their programs. In fact, there are many distinct types of liberal arts colleges because of their unique programs. At Colorado College and Cornell College students can take one course at a time. At St. John's College, students study the Great Books. Another special program at several liberal arts colleges is the 4-1-4 semester. Students take four classes in the fall semester, one in-depth class in the month of January, and four classes in the spring semester. Austin College, Calvin College, and Eckerd College are examples of colleges that have 4-1-4 programs. At some colleges students get to design their own program (e.g., Marlboro College). One liberal arts college, Virginia Military Institute, is a military college. Another liberal arts college, Reed College, provides students with written assessments for their complete coursework rather than grades.

Some liberal arts colleges focus on serving particular populations. There are all-women's colleges. Smith College and Mills College are two such liberal arts colleges. Among the nation's historically black colleges and universities are liberal arts colleges (e.g., Morehouse College, Spelman College). One of the few all-men's colleges left in the United States, Washburn College, is a liberal arts institution.

### Role of Liberal Arts Colleges in the U.S. System

Liberal arts colleges serve students who wish to become educated citizens and productive members of society. The liberal arts college strives to produce thoughtful, well-rounded citizens of the world. The promise of a liberal arts education is well summed up by Michele Myers, president of Sarah Lawrence College, when she notes that liberal arts colleges provide "an education in which students learn how to learn, an education that emphasizes the forming rather than filling of minds, an education that renders our graduates adaptive to any marketplace, curious about whatever world is around them, and resourceful enough to change with the times."

## LIFE EXPERIENCE FOR COLLEGE CREDIT

As higher education continues to attract an increasing number of adult students, many colleges and universities are developing programs to meet their distinctive needs. These students, age twenty-five and over, comprise 38 percent of the undergraduate population, according to the U.S. Bureau of the Census in 1999, and bring with them rich clusters of college-level knowledge gleaned from a variety of sources. They provide challenges to higher education not seen with traditional-age college students, including financial concerns, time constraints, and a distinct desire not to repeat learning what they have already gained from their professional or life experience. As a result, the practice of awarding college credit for learning from life experience has become a popular effort to attract and retain adult students.

Although the awarding of such credit is a legitimate academic process to some, it is not without controversy. The idea of granting college credit for learning that takes place outside the classroom challenges the very foundation of higher education. Some look upon the practice as a radical doctrine of giving away credit or of granting credit just for living, and it may seem inappropriate for the carefully regulated university setting. If the assumption is made that learning takes place everywhere, and that higher education is a part of a larger system of human learning that includes family, church, school, media, social institutions, and the work place, the rationale behind the practice may become more apparent.

Advocates of the practice find support in the teachings of John Dewey, who asserted that “all genuine education comes about through experience.” Such experience is not limited to the classroom; in fact, the academy has no monopoly on learning. If learning takes place, it should not matter how it is accomplished, as long as the outcome is realized. If the outcome is college-level learning, then the awarding of college credit for the experience can be justified.

The granting of college credit for learning outside the classroom is not a new practice. As early as 1942 the American Council on Education (ACE) worked with branches of the military to evaluate service members' learning through military education and training. The resulting *Guide to the Evaluation of Educational Experiences in the Armed Services* documents secondary and postsecondary credit equivalencies, and has grown from one volume in its first printing in 1946 to three volumes covering all branches of the military and the U.S. Department of Defense in 2000.

Formalized testing programs as a means of assessing prior learning first made their appearance in the mid-1960s. Standardized examinations, designed by various national organizations, are intended to be applicable to large populations and to measure levels of accomplishment in many subjects.

A program to evaluate the in-house training that was sponsored by business and industry was begun in 1974. The Program on Noncollegiate Sponsored Instruction (PONSI) began by evaluating training courses offered by eight major corporations and recommending college credit when the learning experiences were found to be at the college level. In

the process, a model-reviewing system was designed, which resulted in the publication of *A Guide to Educational Programs in Noncollegiate Organizations*. Replaced in 1985 by *College Credit Recommendations*, the 2000 edition serves nearly 300 organizations across the nation and evaluates more than 5,000 training courses and programs.

At about the same time, the Educational Testing Service (ETS) began a research and development project designed to establish procedures for academic recognition of noncollege learning. Known in 1974 as the Cooperative Assessment of Experiential Learning (CAEL), the project focused on gathering data about prior learning assessment practices throughout the country. As a result, faculty and student handbooks were published for the first time that documented the practice of portfolio assessment. By 1979 ACE, the Council on Postsecondary Accreditation (COPA), and the American Association of College Registrars and Admissions Officers (AACRAO) endorsed the assessment of noncollege learning with the understanding that it would be conducted according to CAEL standards. Now known as the Council for Adult and Experiential Learning, CAEL is an independent organization recognized as a premier authority in the field. CAEL has established and disseminated standards for the awarding of credit for noncollege learning, training faculty evaluators, and implementing research on the outcomes of these efforts. The organization maintains a quality assurance program to monitor and evaluate current assessment programs throughout the nation.

### Standards of Assessment

As institutions determine their level of commitment to the practice of granting credit for noncollege learning, a number of standards must be addressed to ensure legitimacy. ACE, PONSI, and CAEL have developed guidelines based upon national practices and research studies. These guidelines are available to any institution for adoption or modification. Colleges and universities can also initiate their own internal processes if they are willing to invest money, time, and resources. In either case, the institution must be aware that credit should only be granted for the learning that accompanies the experience, not for the experience itself. In addition, criteria must be determined for what constitutes college-level learning. Previous research has suggested that college-level learning must exhibit the following characteris-

tics, being (1) demonstrable in some form; (2) conceptual as well as practical; (3) applicable outside the setting in which it was learned; (3) related to an academic field; (4) reasonably current; and (4) traditionally taught at the college level.

### Methods of Assessment

For the purpose of determining if college-level learning has taken place in a noncollegiate setting, a prior learning assessment must be conducted. This can be accomplished in a number of ways, including the process of standardized examinations; course challenge or departmental examinations; ACE recommendations on military education and training; PONSI recommendations on corporate education and training programs; and individualized programs, including portfolio assessment, oral interviews, and competence demonstrations.

Standardized examinations may include the College-Level Examination Program (CLEP), the Defense Activity for Nontraditional Educational Support (DANTES), the Student Occupational Competency Achievement Test (SOCAT), Advanced Placement (AP) examinations, and others. They may cover a variety of subject areas and are available at testing centers across the country. Each individual institution must develop policies and practices for acceptance of learning indicated by examination results.

Course challenge or departmental examinations are designed by the institution, the department, or the faculty member responsible for the course for which the student is seeking credit. Challenge examinations are not standardized and may not be available for all subject areas. Credit granted for challenge examinations is subject to university and/or departmental discretion, regulations, and fees.

Military personnel often complete college-level courses while in the service. These include service school courses, monitored correspondence courses, Department of Defense (DoD) courses, and occupation specialty training. A record of completed training appears on a service member's discharge papers and may be assessed with the aid of the *ACE Guide to the Evaluation of Educational Experiences in the Armed Services*. No test or examination is necessary to receive credit through this method.

The National Program on Noncollegiate Sponsored Instruction (PONSI) evaluates courses and programs offered by corporations, unions, govern-

ment agencies, health care organizations, and professional groups and publishes equivalencies in its annual *College Credit Recommendations* series. Again, no test or examination is necessary to receive credit through this method.

Often learning outside the classroom is accumulated over an extended period or in a number of different situations. In such a case documentation may be difficult to provide. Individualized assessment is often the method of choice in such a situation because it is a more flexible means of allowing the student to explain the learning and give evidence of its validity. Individual assessment is designed at the institutional level and may include portfolio evaluation, oral interview, competence demonstration, or any combination of these methods. Although extensive guidelines are available through such advisory services as CAEL, each college or university must adopt its own set of procedures for assessment.

The portfolio is a document compiled by the learner in support of the request for credit. It typically consists of an essay describing background, goals and prior learning, a description of the learnings for which credit is requested, an explanation of how the learnings were acquired, a body of evidence documenting that the learnings are valid, and a request for specific equivalent credit. Often, institutions require that the learner enroll in a portfolio preparation course to provide structure to the process of negotiating for credit. The instructor is a trained faculty member who assists the learner in preparation of the portfolio, conducts interviews and demonstrations as necessary, and makes recommendations for the awarding of credit. Interaction with other faculty with content expertise is also necessary to ensure concurrence with credit recommendations.

### Further Considerations

For institutions that adopt the practice of granting credit for learning from life experience, there are other considerations which must be addressed. Financial commitments, faculty training, fee assessment, accreditation outcomes, transcript notations, and transfer issues are just a few of the university processes that may be affected. Just as adult students have changed the face of the early-twenty-first-century university, so does the very practice of assessing the learning that they bring with them.

NELL NORTINGTON WARREN

## LIFELONG LEARNING

*Lifelong learning* is a broad, generic term that is difficult to define with specificity. Its overlap, or its interchangeable use, with other closely related concepts, such as lifelong, permanent, recurrent, continuing, or adult education; learning organizations; and the learning society (society in which learning is pervasive), makes this even more true. For some it includes learning from childhood and early schooling, while others treat it in terms of the adult learning process. It has grown to a global concept, with differing manifestations that vary with national political and economic priorities, and with cultural and social value systems.

*Lifelong learning* is used here in an inclusive sense that accommodates this heterogeneity. A statement resulting from a collaboration of the European Lifelong Learning Initiative and the American Council on Education provides a workable expression of this broader acceptance:

*Lifelong learning is the development of human potential through a continuously supportive process which stimulates and empowers individuals to acquire all the knowledge, values, skills, and understanding they will require throughout their lifetimes and to apply them with confidence, creativity and enjoyment in all roles, circumstances, and environments.* (Longworth and Davies, p. 22)

This definition includes several basic elements of the lifelong learning ideal: (1) a belief in the idea of lifetime human potential and the possibility of its realization; (2) efforts to facilitate achievement of the skills, knowledge, and aptitudes necessary for a successful life; (3) recognition that learning takes place in many modes and places, including formal educational institutions and nonformal experiences such as employment, military service, and civic participation and informal self-initiated activity; and (4) the need to provide integrated supportive systems

adapted to individual differences that encourage and facilitate individuals to achieve mastery and self-direction. Society should make these systems available to learners with flexibility and diversity.

### Evolution of the Lifelong Learning Movement

Lifelong learning crystallized as a concept in the 1970s as the result of initiatives from three international bodies. The Council of Europe advocated *permanent education*, a plan to reshape European education for the whole life span. The Organisation for Economic Co-operation and Development (OECD) called for *recurrent education*, an alternation of full-time work with full-time study similar to sabbatical leaves. The third of these initiatives, a United Nations Educational, Scientific and Cultural Organization (UNESCO) report, *Learning to Be* (1972), drew most attention and had the broadest influence. Commonly known as the Faure Report, this was a utopian document that used the term *lifelong education* instead of lifelong learning, and it foresaw lifelong education as a transformative and emancipatory force, not only in schools, but in society at large. One commentator, Charles Hummel, called the UNESCO concept a Copernican revolution in education.

U.S. educational and political leaders took note of these ideas. Usually, they adopted the term *lifelong learning* (rather than lifelong education) and applied it to adult education, leaving initial and secondary education to the existing system. The American discussion tended to be more pragmatic than visionary, addressing specific categories of educational need rather than proposing systems. The Mondale Lifelong Learning Act of 1976 included in its scope a laundry list of nearly twenty areas, ranging from adult basic education to education for older and retired persons, a charge that proved too diffuse to address with public policy. European and American policy interest in lifelong learning waned after the early 1980s, although interest continued among educational institutions and nongovernmental organizations.

Interest in lifelong learning revived in the early 1990s, both in Europe and the United States. A fresh round of studies and reports popularized the idea of lifelong learning, and it became part of national policy discussion, particularly as global competition and economic restructuring toward knowledge-based industries became more prevalent. In a full-employment economy, corporations perceived a

benefit from investment in human capital, while a new workforce of *knowledge technologists* expected their employers to maintain their employability by investing in their education. The focus on learning thus shifted from personal growth to human resource development. Meanwhile, education and training approaches became central to a transition away from unemployment and welfare dependency.

### Implementation of Lifelong Learning

Adult participation rates suggest that a mass population has embraced lifelong learning and that the learning society may have arrived. U.S. data for 1998–1999 show that an estimated 90 million persons (46% of adults) had enrolled in a course during the preceding twelve months, an increase from 32 percent in 1991. There are indications that large increases also occurred in other developed countries. Field called this a “silent explosion” that makes the most of the people inhabiting learning societies.

The U.S. figures stated above include only formal courses led by an instructor, divided into six categories: (1) English as a second language (ESL), (2) adult basic education and high school completion courses, (3) postsecondary credential programs, (4) apprenticeship programs, (5) work-related courses, and (6) personal development courses. The largest categories of participation during the twelve-month period were work-related and personal development courses. Informal learning was not included.

To serve such a vast population, and to absorb a nearly 50 percent rate of increase in less than a decade, implies a major increase in providers and services. An exhaustive discussion is not possible in this brief space, but some indications of change can be suggested. Public schools and community colleges in large measure serve ESL, adult basic education, and high school completion needs, especially preparation for the General Educational Development (GED) examination. Data on dropouts who have attained high school equivalency by age twenty-four indicate that these institutions are being successful in this mission. Many community colleges have increased their ESL programs to serve new immigrant populations, and a large number of voluntary and community organizations have joined them, especially in literacy programs.

Programs related to employment come from several sources: apprenticeship programs, work-related courses, and credential programs. An inter-

esting development has been the collaboration between different providers attempting to enhance credentials by offering joint curricula; such as the collaboration between community colleges and corporations to offer apprenticeships and training in conjunction with the associate degree. Work-related courses touch on a broad range of content, providers, and delivery settings. They may be freestanding, self-contained experiences of a single course, or they may include sustained, interrelated courses that lead to a certificate or other qualification. Many sustained programs focus less on technical skills and more on the general education needed in the knowledge-based workforce. In some cases, largely depending on their size and commitment to workforce development, corporations may create their own internal *corporate universities* to offer extensive programs designed for their own needs. Others prefer to access the resources and experience of external providers, such as higher education institutions or professional education and training organizations. Community colleges have foreseen a major role for themselves in this work.

Around 1970 colleges and universities began to attract greater numbers of adult, nontraditional learners—this population increased from 27.7 percent of all higher education enrollments in 1970 to a range between 42 and 44 percent in the mid-1990s. Many programs adapted their practices and created new programs in response. A generation of innovation in higher education has opened many opportunities for adult learners. Changes have included greater flexibility in admissions and in time and place of instruction, more individualization of curricula, assessment for credit of previous courses and informal learning, transformation of faculty from teacher experts into mentors or facilitators, and provision of more intensive adult-oriented student services, including services responsive to the unpredictable exigencies of adult learners' lives.

Two other developments have attracted considerable attention. One is the rapid growth in the number of for-profit degree-granting institutions, which usually offer high-demand career-related curricula in cohort formats, providing learners with predictability in their time-to-degree and cost commitments. The record of accreditation at these institutions has established a reputation for quality. The other novelty is high-level for-profit certificate programs in information technology. These programs maintain quality through self-regulation, but they

stand outside the usual quality-control systems. There is a fear, however, that they may draw lifelong learners away from institutions of higher education.

Personal development courses, which made up 23 percent of the 1998–1999 adult enrollments, are even more heterogeneous than work-related courses, both in their content and their providers. This may be the sector where lifelong learning serves its richest menu, ranging from health and fitness to recreation and hobbies, civic and political engagement, travel and cultural experiences, and religious and Bible studies. It can include every level of interest and every age or stage of development. For instance, major areas of growth have occurred in areas of interest to older learners. Organizations such as Institutes of Learning in Retirement and Elderhostel have played a role in this growth.

### Ongoing Issues in Lifelong Learning

Despite a generation of discussion of the concept, a number of questions divide lifelong educators and policymakers. Several still prefer the term *lifelong education* because it implies a more explicitly intentional learning than the casual, unintended learning implied by *lifelong learning*. To many observers, lifelong learning itself is a contested concept with varying meanings and values. Some believe the broad humanistic and democratic idealism of the Faure Report has been sacrificed to an instrumental goal of human capital development, thus weakening the commitment to personal enrichment, civic participation, and social capital development.

Early advocates of lifelong learning not only regarded it as extending to the end of life, but also commencing in the earliest years. In practice, most innovation has come in programs conceived specifically for adults. By 2000, however, appeals to engage early schools in the lifelong learning enterprise began to reappear.

Finally, lifelong learning (and the creation of autonomous, self-directed individuals) implies a risk to learners and to social cohesion. Such emancipated persons can become less likely to defer to established institutions or to be guided by common social and cultural norms, adopting instead an analytical stance that isolates them from others and fragments society. The freedom of choice rests with them, but so also does the burden of responsibility in what some call critically reflective societies.

## Conclusion

Few, if any, of the comprehensive, integrated lifelong learning systems envisioned by the Council of Europe and the Faure Report in the 1970s have been realized. On the other hand, observers cannot deny how closely linked learning and well-being have become in the twenty-first century—and how pervasive both awareness of and participation in lifelong learning activities are among contemporary populations. Numerous questions remain, not least among them the inequality of opportunity between well-educated persons and the less advantaged in given societies, and between developed and developing countries. Lifelong learning advocates can only hope that enough of the early fervor and optimism of the movement remain to find solutions to these issues.

## LINCOLN SCHOOL

---

The Lincoln School (1917–1940) of Teachers College, Columbia University, was a university laboratory school set up to test and develop and ultimately to promulgate nationwide curriculum materials reflecting the most progressive teaching methods and ideas of the time. Originally located at 646 Park Avenue in New York, one of the most expensive pieces of real estate in the city, the Lincoln School was also a training ground for New York City's elite, including the sons of John D. Rockefeller, Jr., who provided the funding for the school. Among the school's chief architects were Charles W. Eliot, a former president of Harvard University and an influential member of the New England Association of Colleges and Secondary Schools; his protégé Abraham Flexner, a member of the controversial Rockefeller philanthropy, the General Education Board; Otis W. Caldwell, a professor of science education at Teachers College and the school's first director; and the dean of Teachers College, James E. Russell.

In the 1920s and 1930s the Lincoln School was the most closely watched experimental school in the educational world, making solid contributions in the work of laboratory schools. It provided a select number of Teachers College students with clinical teaching experience, engaged in curriculum design and development, and provided an observation and demonstration site for teachers from around the United States and abroad. Its own experimental research institute promoted staff development and student teaching, and it distributed its printed materials in national journals and in mass mailings to schools throughout the United States.

Caldwell and his staff constructed an interactive or "experience" curriculum designed to relate classroom materials to the realities of everyday urban-industrial as well as agricultural life. Science and mathematics courses emphasized the practical application of these subjects to life in the contemporary world. Students learned through nonacademic community resources—the fire department, markets, churches, transportation and communication facilities—that were used as models for the reorganization of school life, and through music, language, art, and social studies where students imbibed principles that, in the language of the school's literature, were "foundational to effective and upright living."

Experiences were rarely spontaneous, however, in classrooms where carefully planned experiments

guided every phase of the work and where teachers used modern laboratory methods of collection, organization, and interpretation of data. In keeping with the dual purpose of the school—experimental curriculum development and character training in new forms of social responsibility—children were led through a sequence of avowedly "modern" courses. "Modern" meant practical and useful, with a direct bearing upon the everyday work of the world in finance, industry, agriculture, government and the arts. It also meant a great deal more science and mathematics instruction than one found in the traditional curriculum. Science teaching, according to Caldwell, a biologist, and Harold Rugg, his colleague in mathematics, was valuable because it taught good citizenship defined as "the increased respect which the citizen should have for the expert." This was in an age which had become "amazingly complicated [and] incalculably difficult to understand" and in which the salient feature was "the political and economic ignorance and indifference of the common man."

The classical defenders of liberal culture found much to hate in the program of the Lincoln School, which they regarded as devoid of emotion, imagination, poetry, beauty, and art. Critics also worried about the involvement of the General Education Board and the powerful industrial statesmen who headed it, pointing to the ambiguous position of the charitable trust in a democratic society.

What kind of a school was it, historians still want to know, that could combine cultural epoch theory, the doctrine of interest, and parvenu notions of social efficiency with the relatively remote, patrician sensibilities of founders and supporters like Eliot and the Rockefellers? What kind of a school was it that would teach vocational math and science to its upper and upper-middle class students, but not Greek and Latin, the traditional foundations of elite culture? The School itself could never quite decide what it was: An experiment in progressive practices? A hedge against those practices when they shifted dangerously toward bureaucratic centralism? Or the harbinger of something entirely new and novel and distinctly modern? This last possibility was allowed to die early, a sacrifice to child-centeredness, to subject-matter fetishism, and to an experimental tradition that controlled for these factors but otherwise ignored them for larger, correlative and integrative purposes. In 1940 the Lincoln School collapsed under the weight of its own contra-

dictions. A Special Committee of the Board of Trustees of Teachers College in the interest of both intellectual and practical economy recommended its amalgamation with the larger and less research-intensive Horace Mann School.

### LINDQUIST, E. F. (1901–1978)

One of the foremost applied statisticians and educational testing pioneers of the 1900s, Everet Franklin

Lindquist received his Ph.D. from the University of Iowa in 1927 and was a member of the faculty there from 1927 until his retirement in 1969. During his long professional career, he made substantial contributions to the field of education in the areas of test development, test-scoring technology, measurement theory, and research methodology. His textbooks on design of experiments and statistical analysis had considerable influence on educational and psychological research.

#### Test Development

As director of Iowa Testing Programs at the University of Iowa, Lindquist was responsible for the development of the first editions of both the Iowa Tests of Basic Skills (ITBS) and the Iowa Tests of Educational Development (ITED). In the 1940s he served as an advisor to the United States Armed Forces Institute and to the American Council on Education (ACE). He played a major role in formulating policies with respect to granting academic credit for general educational growth during military service. These policies resulted in the development of the General Educational Development Test (GED). Lindquist oversaw the creation of the initial forms of the GED, which were modeled after the ITED. In the late 1950s Lindquist also was responsible for the design and construction of the first forms of the National Merit Scholarship Qualifying Test (NMSQT). In 1959 Lindquist and Ted McCarrel, registrar at the University of Iowa, cofounded the American College Testing Program (ACT) as an alternative to the College Entrance Examination Board. Lindquist was personally responsible for the design and development of the early editions of the ACT tests.

All of these tests continue to be published and used in the early twenty-first century. Although the tests have evolved over the years, it is a tribute to Lindquist's vision and creativity that he recognized the need for such tests and that the philosophy underlying them continues to be reflected in recent editions.

#### Test-Scoring Technology

In the late 1940s the Iowa tests developed under Lindquist's direction were being administered to large numbers of students in Iowa and throughout the nation. The demand to have the answer sheets of these tests scored at a central agency was growing. It became apparent to Lindquist that this demand would require a more efficient way of processing the

answer sheets than the hand-scoring procedures then being used. Although crude scoring machines were available, they were not adequate for large-scale testing. Thus, in the early 1950s Lindquist undertook a major project to design a high-speed electronic scoring machine. He and his colleagues at the University of Iowa succeeded in building such a machine in the mid-1950s. The original version scored at the rate of 4,000 sheets per hour. They developed faster machines fairly quickly, and by 1970 the scoring machine could scan 40,000 sheets per hour. Without question, the availability of such scoring machines had a significant impact on testing practices in the United States.

### Measurement Theory

Lindquist's major contributions to the field of measurement theory occurred primarily through two publications. The first of these was the influential volume *Educational Measurement* (1951), for which he served as general editor. Eighteen of the most distinguished measurement experts, including Lindquist himself, wrote chapters for this landmark publication. It served as the major reference for the educational measurement community until the second edition was published twenty years later.

Lindquist's second major contribution, and perhaps his most technical work in measurement, was published as the last chapter in his textbook *Design and Analysis of Experiments in Psychology and Education* (1953). In this chapter, "Estimation of Variance Components in Reliability Studies," Lindquist explicated techniques, which were not new in the statistical sense. But their relevance to educational and psychological measurement had not been appreciated. Lindquist saw these tools as a significant improvement over traditional methods of estimating measurement error variance and hit-or-miss methods of designing efficient, cost-effective measures. In essence, he provided the foundations for an area known as generalizability theory ten years before the first publications of Lee Cronbach et al. on this approach appeared in the literature of educational and psychological measurement.

### Research Methodology

Lindquist's influence in the field of educational research occurred primarily through his textbooks. Early in his career, he concluded that a textbook constituted a more valuable vehicle than journal articles or conference presentations in reaching the ed-

ucational research community. Thus many of his innovative ideas and original insights were published in his books. In *Statistical Analysis in Educational Research* (1940), he assumes the role of statistical translator for the educational research community. He was concerned about the slow adoption of the techniques of analysis of variance and covariance, including factorial designs, in the behavioral sciences. The implications of the work of Ronald A. Fisher had made little impression on educational and psychological researchers. Lindquist perceived this failure to be the result of a widespread inability of research workers to read the relevant literature and to translate terms such as *blocks*, *plots*, *treatments*, and *yields* into *schools*, *classes* or *pupils*, *educational methods*, and *test scores*. In this 1940 text, he undertook to facilitate this translation.

In a second influential book, published in 1953, *Design and Analysis of Experiments in Psychology and Education*, Lindquist again had the goal of translating statistical analyses developed in other fields into language understandable to researchers in psychology and education. However, he soon recognized that the adaptation of certain designs developed for use in industry and agriculture was by no means straightforward. The educational and psychological researcher's alternatives with respect to the choice of the unit of analysis often had no obvious analog in the original industrial and agricultural contexts. The phenomenon of repeated measurements on the experimental units took on a unique character in the behavioral sciences. Certain designs, such as Latin square designs, were seen to be potentially useful in the behavioral sciences. But their purposes and implementation differed significantly from the classical applications. The entire area of multidimensional, repeated-measurements designs had to be reworked. Analyses appropriate to factorial experiments that involve independent groups on some dimensions and repeated measurements on others had to be formulated almost without helpful precedent from other sciences. Thus his 1953 book represented far more than a statistical translation. It incorporated a number of original insights and formulations, particularly in the area of "mixed" designs involving both independent and dependent measurements. In sum, Lindquist's ability to bridge the statistical gap between education and other areas enabled him to exert a significant influence on educational research from the 1940s through the 1970s.

**EMERGENT LITERACY**

William Teale and Elizabeth Sulzby coined the term *emergent literacy* in 1986 from Mary Clay's dissertation title, "Emergent Reading Behavior" (1966). Their term designated new conceptions about the relationship between a growing child and literacy information from the environment and home literacy practices. The process of becoming literate starts before school intervention.

Important changes took place around 1975 to 1985 in the way researchers approached young children's attempts at reading and writing, which were influenced by previous language acquisition studies of children actively engaged in learning oral language.

In English-speaking countries, literacy acquisition was traditionally focused on acquisition of reading. Writing was considered an activity undertaken after reading. Carol Chomsky's 1971 article "Write Now, Read Later" was for this reason provocative. It is worth noting that these two opposite views (reading before writing or writing before reading) are alien to other cultural traditions. For instance, in the Spanish school tradition both activities have been traditionally considered as complementary.

Teale and Sulzby maintained that "in the schools, the reading readiness program and the notion of the need to teach prerequisites for reading became fixed. Furthermore, using reading readiness programs in the kindergarten literacy curriculum became a widespread practice. The reading readiness program which became so firmly entrenched during the 1960s remains extremely prevalent in the 1980s" (p. xiii).

The concept of emergent literacy was intended to indicate a clear opposition with the then prevailing notion of "reading readiness." This new concept arises from changes in the research paradigm, mainly in developmental psycholinguistics, and not in the practical educational field.

**The Original Meaning of the Concept**

Several pioneering researchers (among them Clay in New Zealand, Yetta Goodman and Sulzby in the United States, and Emilia Ferreiro in Latin American countries) share several main ideas that can be summarized as follows:

1. Before schooling, a considerable amount of literacy learning takes place, provided that

children are growing in literate environments (homes where reading and writing are part of daily activities; urban environments where writing is everywhere—in the street, in the markets, on all kinds of food containers or toys—as well as on specific objects like journals, books, and calendars).

2. Through their encounters with print and their participation in several kinds of literacy events, children try to make sense of environmental print. Indeed, they elaborate concepts about the nature and function of these written marks.
3. Children try to interpret environmental print. They also try to produce written marks. Their attempts constitute the early steps of reading and writing. Thus, reading and writing activities go hand in hand, contributing to literacy development as comprehension and production both contribute to oral language acquisition. The use of the term *literacy* in the phrase *emergent literacy* indicates that the acquisition of reading and writing take place simultaneously.
4. The pioneer authors of the emergent literacy approach avoid the use of terms like *pretend reading* or *pre-reading*, *pretend writing* or *pre-writing*. Such terms, in fact, establish a frontier in the developmental process instead of a developmental continuum.
5. From a careful observation of spontaneous writing and reading activities as well as from data obtained through some elicitation techniques, it becomes possible to infer how children conceive the writing system and the social meaning of the activities related to it.
6. Emergent literacy is a child-centered concept that not only takes into account relevant experiences (like sharing reading books in family settings), but also takes into consideration that children are always trying to make sense of the information received in a developmental pathway that is characterized both by some milestones common to all and by individual stories.

### Transformations of the Original Meaning

What is the use of the expression *emergent literacy* fifteen years after its first introduction into the literature? This expression competes with others such as

*beginning literacy*, *early literacy*, or even *preschool literacy*. It is not unusual to see alternative terms used by the same authors (for instance Dorothy Strickland and Lesley Morrow). The term *emergent* remains restricted to English users. It is not used in Spanish nor in Italian or French, where expressions like “*éveil au monde de l’écrit*” (“awakening to the world of writing”) convey similar ideas.

The emergent literacy approach affects preschool settings and shapes new educational practices. Instead of exercises to train basic skills as a prerequisite to reading, researchers frequently observe teachers and children engaged in real reading activities. Instead of exercises of copying letter forms, teachers encourage children to produce pieces of writing.

Independent research conducted in the linguistic and historical fields by such people as David Olson, Florian Coulmas, and Geoffrey Sampson contributed, during the closing decades of the twentieth century, to a reconsideration of writing systems. As long as alphabetical writing systems (AWS) are being conceived as visual marks for elementary units already done (i.e., the phonemes), the task of the child is reduced to the learning of a code of correspondences. But AWS are highly complex because they are the result of a long history, in which phonic considerations interfere with historical, pragmatic, and even aesthetic considerations.

However, the old pedagogical ideas are still so strong that the term *emergent literacy* has begun to be used as a new component of old practices. Expressions such as *to teach beginning literacy*, *evaluation of emergent literacy skills*, and even *emergent literacy teachers* are a commonplace in books, articles, and papers devoted to teachers, parents, and decision-makers. It is clear that emergent literacy cannot be taught, even if it can be improved or stimulated. The reduction of this concept to a set of trainable skills goes against the term’s original meaning.

In the meantime, “phonological awareness” began to be considered the single strong predictor of school reading skills (reading, in that case, is evaluated in tasks of letter-sound correspondences in front of lists of words and pseudo-words). Some authors started to look for the components of emergent literacy—a set of skills—to allow similar assessment as phonological awareness.

When emergent literacy skills include phonological awareness it is clear that the new label is being

applied to old ideas: emergent literacy originally indicated concepts built up by children through many encounters with print other than explicit teaching, whereas phonological awareness is clearly an acquisition that does not develop without explicit intervention, even if it is closely related to the acquisition of an AWS. For instance, when parents engage in shared reading, they offer the child the opportunity to learn about many relevant aspects of books but they are not explicitly teaching a particular literacy component.

This shaping of new ideas into old paradigms is present also in psychological research, such as the 1998 publication by Grover Whitehurst and Christopher Lonigan. It could seem, at first glance, entirely justified to inquire about the components of early literacy, and the weight of each one of them as predictors of school achievements in reading. However, the identification of these components and the assessment of their individual weight shows that literacy continues to be conceived mainly as reading behavior and that written language is still conceived as a coding of already given elementary units (the phonemes) into a graphic form (the letters of an alphabet). The persistent confusion between the teaching activities and learning processes (i.e., how children contribute to the task, how they transform the available information through their own assimilatory processes) is at the core of the weak results that try to discover the relevant correlations between early literacy and future school achievements.

### Policy

For the time being, the best recommendation for any preschool program is to offer children many opportunities to engage in real reading and writing activities, with the grounded conviction that children—who are intelligent human beings—are eager to learn and will take advantage of a stimulating environment. The old view that prevented children from sharing literacy learning opportunities until they were ready to learn lessons is a discriminatory one, as not all parents all over the world are able to provide literacy experiences.

EMILIA FERREIRO

### INTERTEXTUALITY

A teacher asks students to find ways in which the stories "The Emperor's New Clothes" and "Chicken Little" are similar and ways they are different. A member of a book club compares last month's selec-

tion to the current month's. A book review includes some of the dialogue from the reviewed book. People leaving the movie theater after seeing *Lord of the Rings* comment that the book was better. The movie *Pocahontas* is criticized by historians for misrepresenting established historical events. In each of these examples, different texts are brought together, related to one another, or connected in some way. This juxtaposition of different texts is called *intertextuality*. Intertextuality occurs at many levels, in many forms, and serves a variety of functions; the foregoing examples reflect only a small subset of the possibilities.

### Levels, Forms, and Functions of Intertextuality

Juxtapositions may occur at multiple levels including word or phrase, sentence or utterance, larger units of connected text such as a paragraph or stanza, and genre. Intertextuality can be created through the following means:

- duplication (a string of words occurring in two texts such as occurs in quotation) and stylistic means (repetition of a stress, sound, or rhyme pattern across two or more texts)
- naming and reference (as occurs in citations)
- proximal association (as occurs among chapters in an edited book which are presumed to have some relationship to each other)
- sequential association (an established sequence of related texts such as a reply to a letter or e-mail).

Intertextuality can be explicit or implied through a variety of literary devices (e.g., allusion, metonymy, synecdoche).

Intertextuality can be viewed as a function of social practices associated with the use of language. It is a social practice of scholars to refer to previous scholarly works through the use of quotations, citations, and bibliographies. The reading and use of book reviews, movie reviews, and similar texts can be viewed as social practices, which by definition are overt intertextual practices. Intertextuality can be created when an unexpected text occurs within a social practice. For example, if instead of receiving a report card at the end of a grading period, a student received a poem, part of the meaning of the poem would be from its placement in a particular social practice and its contrast with the genre of report card.

### Locations of Intertextuality

A key question to ask about intertextuality is its location, because questions about location reveal different definitions and approaches to the analysis of intertextuality. Some scholars locate intertextuality in the text itself when explicit or implied reference is made to another text. The intertextual relationship exists whether or not it is detected by the reader and whether or not it was intended by the author of the text. From this perspective questions can be asked about how one text signals another text and what meaning is conveyed by the text through the intertextual reference.

A second location of intertextuality is in the person. As a person interacts with the target text (whether spoken, written, or electronic), the person brings to the interaction with the text previous texts and his or her experience with them. Some of these previous texts may be conversations, books, or other printed texts, narratives of personal experience, memories, and so forth. The person may use these previous texts to create meanings for the target text or to help with the process of comprehending the text. For example, previous experience in reading a mathematics text provides guidance and procedures for reading a new mathematics text. Because, for example, individuals have different background experiences and histories of encounters with conversational and written texts, the texts a particular person might bring to any interaction with a target text would vary. So too would their use of those texts. Other questions of interest pertain to understanding the cognitive processes involved in using texts from previous experiences.

Closely related to locating intertextuality in the person is locating intertextuality in the task. For example, an academic task might require a person to interact with multiple texts in order to understand some phenomenon, such as a historical event. In such a case, the task explicitly requires the use and juxtaposition of multiple texts. In some cases, multiple texts may even be provided as part of the presentation of the task. However, it may also be the case that the person addressing the task conceives of the task as involving multiple texts, whether or not it is an explicit part of the task. For example, a student given a literary text to explicate may conceive of the task as involving the juxtaposition of the target text, other texts written by the author, the teacher's lectures on the target text, and his or her previous efforts at explicating literary texts with the resultant

teacher comments and grades. From this perspective, questions of interest concern the explicit and implicit intertextual demands made by the task and the interpretation of those demands. Interpretation reflects the person's representation of the task and its intertextual demands and are manifest in what and how texts are used to address the task. Questions can also be asked about the cognitive processes involved in the representation of the task and in its completion. There are interesting questions about the cognitive, affective, and social dimensions of the task, including their role in task interpretation and execution.

A fourth location of intertextuality is in the social practices of a community or social group. Over time, a social group establishes shared standards and expectations for what texts can and should be juxtaposed, and under what circumstances. That is, there are shared, abstract models for the use and juxtaposition of texts in particular types of situations. For example, in a court room, it is a shared social practice of lawyers and judges to interpret testimony and evidence in terms of previous court cases and a specific sets of legal documents (such as the U.S. Constitution). Within an academic discipline, there are specific intertextual practices and these vary from discipline to discipline. For example, in scholarly publications in the social sciences it is customary to cite previous work on the topic of interest. In writing a novel, however, authors do not cite previous novels that have addressed similar themes. In classrooms, teachers and students establish shared intertextual practices for engaging in academic work. For example, there are shared intertextual practices for completing worksheets (e.g., using the text book to answer the worksheet questions), for studying for tests, for writing an essay, and so on.

Although individuals enact intertextual practices, what they are enacting is an abstract model that has evolved over time. As such, the material environment that people encounter may be structured to facilitate certain intertextual practices and inhibit others. For example, many scholastic literature texts are organized to facilitate genre study and the comparison of texts within a particular genre. They do not foster comparison of texts across genre (e.g., poems and short stories). Textbooks often have end-of-chapter questions that refer readers to material in that chapter, but which do not ask readers to use information from previous chapters. From the perspective of intertextuality as located in social

practices of communities and groups, questions can be asked about the intertextual demands of the social practices that make up an institution such as schooling and how various intertextual practices came to be associated with particular social institutions.

A fifth location of intertextuality is in the social interaction of people in an event. As people interact with each other they propose intertextual links, acknowledge the proposals, recognize the intertextual links, and give the intertextual links meaning and social consequence. That is, intertextuality is socially constructed as people act and react to each other. In classroom conversations, a teacher may propose an intertextual link between a story the class is reading, a movie being shown at a local theater, and a mural in the surrounding community. But the proposed intertextuality does not become actualized until the students acknowledge that an intertextual link has been made, recognize the story, the movie, and the mural and the potential connections among them, and give meaning and consequence to those connections. As people interact with each other, the proposed intertextual link may be negotiated and transformed such that the construction of intertextuality is a joint accomplishment shared by all involved in the event. From this perspective, questions can be asked about the interpersonal processes involved in proposing, ratifying, and giving meaning and consequence to intertextuality.

The multiple locations of intertextuality reflect, in part, different disciplinary perspectives on intertextuality, as suggested by the kinds of questions proposed for each location. Cognitive perspectives tend to locate intertextuality either in the text, in the person, or in the task; social, anthropological, and related perspectives tend to locate intertextuality in social, cultural, and historical practices; perspectives associated with sociolinguistic ethnography and symbolic interactionism tend to locate intertextuality in the social interaction of people in an event. Regardless of perspective, intertextuality is inherent to every use of language whether written or spoken, verbal, or graphic. It is ubiquitous in education, in every classroom conversation, instructional task, curriculum guide, educational policy document, and debate. What may be less obvious about intertextuality is the impact it has on delimiting texts that may be juxtaposed as well as establishing participation roles, rights, and responsibilities for interacting with texts. This aspect of intertextuality can be discussed in terms of power relations.

### Intertextuality and Power Relations

Two kinds of power relations associated with intertextuality can be distinguished for heuristic purposes. The first concerns the establishment of boundaries on the set of texts that may be intertextually related in any specific instance. Through historical practice, some authority, material circumstances, or simply the limitations of a person's experience, boundaries are placed on what texts may be candidates for juxtaposition. For example, consider the set of texts that may be considered for a high school course on American literature. It is unlikely that folk songs, rap music, personal journals of ordinary people, or comic books would be considered as possible candidates—much less be included in the course. By establishing particular boundaries some texts and the ideas, people, places, and ideologies they represent are centralized, others are marginalized. However, these boundaries can be crossed; indeed, the *Norton Anthology of African American Literature* includes folk songs, rap music, and a compact disc of oral performances, and the *Norton Anthology of Jewish American Literature* includes a comic-book-like entry.

The second kind of power relations related to intertextuality concerns intertextual participation rights—who gets to make what intertextual links, when, where, how, and to what social consequence. Intertextual rights are not necessarily distributed equally or equitably. Consider a classroom example. A low-achieving student might propose an intertextual link between a novel being read in a class and a rap song. The teacher might dismiss the proposed intertextual link simply because the low-achieving student proposed it. A high-achieving student might make a similar intertextual proposal that is accepted by the teacher and other students. Precisely because intertextuality is ubiquitous in academic and social practices, severely circumscribed and differentially distributed participation rights have important consequences for individuals, the institutions within which they may operate, and the ways in which they operate within those institutions.

### The Educational Significance of Intertextuality

In many ways, teachers and researchers have been using the construct of intertextuality without naming it. Teachers often ask students to relate one text to another, and researchers are often interested in how various conversations and written texts have been juxtaposed. Thus, the explicit naming of in-

tertextual processes and attention to them can be seen as an attempt to create systematic inquiry about intertextuality and to build an understanding of its nuances and consequences.

Recognition of the ubiquitous nature of intertextuality provides educational researchers with a set of heuristics for analysis of classroom conversations, reading processes, writing processes, instructional practices, and assessment practices. Similarly, attention to intertextuality can lead to redesign of curriculum in reading, language arts, literature studies, and social studies. Emphasis can be placed on ways to create understanding and meaning through intertextuality rather than the current emphasis on understanding texts as if they stood alone. There is preliminary evidence to suggest that such an emphasis increases academic achievement, although such increases are probably related to the ways in which texts are juxtaposed rather than simply juxtaposition. Attention to intertextuality also provides ways to enhance connections between academic texts and texts outside of the classroom, including community texts, workplace texts, and family texts.

## LEARNING FROM MULTIMEDIA SOURCES

The predominant means of instruction has traditionally been through verbal medium, either as spoken lecture or written text. As more instructional resources of many different media types become available to students through the Internet, there is a need for educators to understand when these sources may be used effectively for instruction, as well as a need for students to develop an additional set of literacy skills in order to learn from these sources. Although there is much optimism that multimedia sources will be a great tool for instruction, research in cognitive science has demonstrated that the use of these resources does not always lead to better learning. It is important to recognize the potential cognitive implications of multimedia presentations, including text, graphics, video, audio, and virtual reality simulations. Multimedia has been incorporated into instructional materials in a variety of ways: decoration, illustration, explanatory simulation, and "situating" simulation. The first three uses may be best thought of as adjuncts to a verbal lesson, while in the final use, the entire "lesson" is embedded and conveyed by situating the learner in a virtual context.

### Uses

Often multimedia is used to decorate text, with the goal of making the text more interesting for the reader. A second use for multimedia, illustration or description, can be used to help a reader visualize a place or time or object. A third use of multimedia

involves the explanation or explication of concepts. Especially in complex domains, understanding often requires that learners develop a dynamic mental model of phenomena or processes. Multimedia animations, narrations, and diagrams have all been used to support the understanding of complex subject matter by illustrating or highlighting important relations, thereby attempting to convey a correct mental model directly to the student.

### Improved Learning

One reason why multimedia might be expected to lead to improved learning is consistent with a constructivist approach that posits that conditions that make knowledge acquisition more self-directed and active are beneficial for student understanding. The presentation of loosely connected texts and images in hypermedia environments allow learners to navigate information with more flexibility. At the same time, in order to build coherence, students must construct their own elaborations, inferences, and explanations. Thus, there has been reason for optimism surrounding the benefits of learning from hypermedia.

Another reason one might expect benefits from illustrated text and multimedia presentation in general is that it allows for information to be represented in multiple ways (i.e., both verbal and visual). A great deal of previous research within cognitive psychology, such as that of Allan Paivio in 1986, has suggested that the more codes one has for a given memory, the more likely one is to remember that information. Multiple media may also make the learning experience more vivid or distinctive. And, given the different preferences of different learners, multimedia may allow learners to choose the code best suited to their abilities.

A related reason why multimedia, and graphics in particular, may improve learning is that some particular domains may lend themselves to visual presentation, such as when information is inherently spatial. For instance, learning about different ecologies and climate zones may benefit greatly from the presentation of a map. Further, even when the understanding of the subject matter does not require a visual representation, images can still facilitate understanding if the image provides the basis for an abstract model of the content of the text. Figures, graphs, or flow charts that may allow the reader to think about abstract concepts and relations through images support the creation of more complete men-

tal models and as a consequence may improve comprehension of text. Also, when subject matter is as complex and dynamic as streams of data from weather satellites or space stations, then visuals and animations may be especially important. Similarly, visual or audio representations (sonitizations) of complex data can give human thinkers the ability to consider many more dimensions, and the salient relationships between those dimensions, than they might otherwise.

Finally, it should not be overlooked that instructional materials with visual or audio adjuncts are simply more interesting to readers than plain text. Such motivational issues may contribute to advantages in learning with any multimedia presentation.

### Criticisms

With all these potential benefits of images, it is perhaps surprising that since the 1960s, the empirical results on learning from illustrated text have been less than positive. In a 1970 review of studies using illustrated texts, Spencer Jay Samuels found little support for the superiority of illustrated text over plain text. In fact, in some cases illustration leads to poorer learning than simple text presentation. Follow-up investigations suggest that one reason for the lack of a consistent positive effect of images on learning is that any learning effect depends greatly on the kind of image that is used. In a 1987 review of Joel Levin and colleagues that discriminated between decorative illustrations, and conceptually-relevant images, decorative illustrations were found to lead to the smallest improvements and sometimes negative effects in learning. Decorative illustrations are often not relevant for the concepts that are described by the text, yet they are still interesting for the reader, and will attract the reader's attention. For this reason, interesting but irrelevant illustrations can be seen as part of a larger class termed *seductive details* as coined by Ruth Garner and colleagues, and others. Similarly, color, sound effects, and motion are preattentive cues that necessarily attract a reader's focus. If they are not used to emphasize conceptually important information, they too can seduce the reader.

Even when images are relevant for understanding the target concept, there is a further danger that images or animations can make learners overestimate their level of comprehension. People tend to feel that a short glimpse of an image is generally sufficient for understanding. This can lead to an illu-

sion that they understand a graphic or image, even when they have not really engaged in deeper thought about the information. Further, students are notoriously bad at comprehending complex graphics, especially data-related charts or figures, and will interpret the data in support of their own ideas.

Another danger with images and especially animations, is that they can provide so much information so easily that although the reader is able to grasp a basic idea of "how" a dynamic system works, a good understanding of "why" the system works the way it does is lacking (i.e., they are unable to recreate the system or apply their knowledge to a new instance). This effect has in fact been demonstrated in several studies. The research of Mary Hegarty and colleagues, and other research, indicated that still pictures, or still sequences of pictures, in which the reader needs to infer movement for themselves, led to better understanding of dynamic systems than animations that actually show the motions. Similarly, animations that are reproductions of real-world actions are more effective if they are "doctored" to emphasize important features of the display. And, animations that are stoppable and restartable under the learner's control may lead to better learning than real-time simulations. However, images that provide readers with the basis of a mental model, and animations that show the dynamics of a model, may be especially important for people who lack knowledge and spatial ability. Finally, even conceptually relevant adjuncts run the risk of distracting the learner, and they need to be presented in a way that does not compete with the processing of the text. A number of studies, such as the work of Wolfgang Schnotz and Harriet Grzondziel, have shown that students learn better from diagrams and animated graphics when they were presented separately from text. Alternatively, learning from multimedia has been supported by structured computer learning environments, where different media and sources are presented to students, but students are given instruction both in how to use the environment, and are given a specific learning goal.

Other multimedia adjuncts have been studied, most notably narrations and sound effects. The bottom line from these investigations is that narrations only benefit learning when they are nonredundant with text. However, narrations may be especially helpful for poorer readers, especially when they accompany diagrams, and highlight the conceptually important features. Sound effects and music in gen-

eral are distracting, and as adjuncts to text, they do not contribute to better conceptual learning. They do however help simulated environments seem more authentic, and may be helpful for situated learning and anchored instruction. Realistic sound effects may be especially important in skill learning environments. Similarly, in terms of conceptual learning, animations may help only when readers cannot generate mental models on their own, although realistic video may help when learning a procedural task and also in “situating” contexts.

### **The Simulation of Reality**

The final use of multimedia considered here is where multimedia is used, not as an adjunct to verbal instruction, but more extensively as the entire means of presentation. In these lines of application, multimedia is used to simulate reality, through video and audio streams, to produce a sense of learning “in context.” This may be especially important in skill-training environments, when learning in an actual cockpit or surgical operating room would be unsafe and costly. In more academic domains, simulations can give students the feel of an authentic experience, and both situated learning and anchored learning approaches have attempted to capitalize on this advantage of multimedia presentation. Another application of multimedia simulation is the creation of artificial agents that can act as tutors or peers. The presence of an interactive human-like entity may be an especially important coaching tool, and multimedia simulation may make such tutoring experiences more effective than feedback or prompts that appear in text messages. Simulations may also be used to support distance education and collaboration, again by providing a sense of real “co-presence” to the users.

Virtual reality is the ultimate multimedia tool, combining realistic video and audio streams (i.e., three-dimensional), and sometimes even tactile experience. Here, the potential exists to convey an understanding of new concepts in ways that surpass real experience, and many have heralded virtual reality as a powerful educational tool. Most researchers refer to the multisensory-based sense of “presence” that virtual reality affords the user as the characteristic that separates it from other training approaches. Where procedural knowledge and visuo-spatial skills are concerned there seems to be support for this optimism. However, results on more academic subject matter understanding have been less convincing.

Most studies that have been performed on people’s uses of virtual reality have included only self-report data that reflect the user’s interpretation of her or his experience in the virtual environment, while fewer investigations include more direct measures of learning. Among the few virtual reality studies with learning measures, Chris Dede and colleagues examined in 1999 students’ understanding of electromagnetic field concepts from a virtual environment called Maxwell World. Students in the virtual reality condition were better able to define concepts and demonstrate them in three-dimensional terms.

At the same time, pilot studies, such as those of Andrew Johnson and colleagues in 1999, on using virtual reality to promote understanding of astronomical physics concepts have found that the virtual reality environment can also be prone to seductive distractions. For example, to learn that the earth’s shape is round, younger elementary school-age children engaged in a virtual reality game, which included traversing a spherical asteroid to gather objects. The students failed to exhibit a substantial and robust improvement in their understanding, presumably because of the distracting and nonrelevant aspects of the game.

It would seem that virtual reality would be a prime candidate to demonstrate the positive effects of multimedia sources on learning. Yet, virtual reality experiences are not easily translated into learning experiences, and the results of studies on the educational uses of virtual reality underscore the same principles as have been discussed above. Virtual reality may add value to educational contexts when real training is not possible, and where it goes beyond “realistic” experiences in ways that emphasize conceptual understanding.

### **As an Effective Strategy**

As the nature of instructional materials changes to include more images, sounds, animations and simulations, it is important to recognize the conditions under which multimedia can be an effective learning tool, and that new literacy skills are needed to learn from those materials. Instead of being presented with a single message, multimedia learners are presented with many information sources on a topic, and those sources can represent a number of media. The sheer number of resources available through the Internet is enormous. The availability of so much information means that students have the ability to di-

rect their own learning, by performing searches and selecting documents, evaluating sources of information, and allocating attention to images and animations, without being confined by the linear structure of a single text or lecture. Although this flexibility in the learning environment has been seen as an opportunity for more active student learning, it is clear that in order to learn from multimedia and electronic sources, students will likely need additional skills in searching, document evaluation, strategic reading, strategic understanding of graphics, and integrating information across sources, including the integration across text and graphics. A specific set of skills may also be necessary for learning in more immersive multimedia environments.

A recurrent question focuses on how multimedia helps learning. Some have suggested that positive effects due to multimedia may be simply due to the motivating effect of its novelty. Unfortunately the literature of the early twenty-first century contains few controlled studies and few tests of when multimedia helps understanding. Further research is needed to identify what conditions enable the best learning from multimedia, and what new literacy skills students will need to support that learning.

## MULTIMEDIA LITERACY

The term *multimedia* is among several terms that have been associated with literacy to emphasize that literacy extends beyond reading and writing the alphabetic code, and should include a variety of audiovisual forms of representation. Associating multimedia with literacy also highlights a belief among many scholars and educators that conceptions of literacy and how it is developed should not focus exclusively on printed materials, but should include electronic media that have moved into the mainstream of communication, especially at the end of the twentieth century. Implicit in these views is that research and practice related to literacy must be transformed to accommodate new ways of accessing, processing, and using information.

## Related Concepts

Kathleen T. Tyner argued in 1998 that in the information age the concept of literacy has been simultaneously broadened and splintered into many literacies in part because "the all purpose word literacy seems hopelessly anachronistic, tainted with the nostalgic ghost of a fleeting industrial age" (p. 62). Associating the term *multimedia* with literacy is consistent with that trend, although it might be thought of as encompassing a diverse set of related and sometimes ill-defined terms used in scholarly, and often popular, discourse. For example, related terms highlighting media and forms that go beyond the alphabetic code include *media literacy*, *visual literacy*, *technological literacies*, *metamedia literacies*, and *representational literacy*. Broader terms, such as the following, might also be included in this set because they typically acknowledge the role of diverse media and new technologies in broadening conceptions of literacy: *multiliteracies*, *information literacies*, *critical literacy*, and even the negatively stated term *cultural illiteracy*. Narrower terms such as *computer literacy* and neologisms such as *numeracy* also reflect expanding views of literacy, but such terms focus on specific skills and abilities.

## Past and Present Conceptions

Broadening the scope of literacy, specifically in relation to diverse media, is not entirely a phenomenon of the late twentieth and early twenty-first centuries. Interest in how new media might affect conceptions of literacy can be traced to the widespread use of electronic audiovisual media such as television and film in the first half of the twentieth century. For example, Edgar Dale, well known among a earlier generation of educators and researchers for his work related to literacy, discussed the need for critical reading, listening, and observing in contending with the new literacies implied by audiovisual media of the 1940s.

Nonetheless, beginning in the latter decades of the twentieth century, the impetus for broadening the scope of literacy has been the increasing integration of digital technologies into the mainstream of everyday communication and the inherent capability of those technologies to blend diverse modes of representation. New modes of digital communication exist not only in parallel with conventional printed forms, but they have replaced or moved to the margins conventional forms of reading and writing. For example, the obsolescence of the typewriter,

the ascendance of e-mail as the preferred alternative to diverse forms of correspondence on paper, the emergence of the Internet as a prominent cultural phenomenon, and the appearance of the electronic book represent a steady yet incomplete and unpredictable progression away from conventional printed forms. Likewise, students in the early twenty-first century routinely encounter digital information employing diverse audiovisual media presented in formats that are more interactive and dynamic than printed texts, although those encounters have been more likely to occur outside the school, as revealed in a national survey sponsored by *Education Week* in 2001.

Nonetheless, the opportunities for seeking out and creating such texts in schools have grown steadily. For example, the availability and use of the Internet, applications for creating digital documents and presentations, and similar digital activities has increased substantially since the mid-1990s. The parallel increase of electronic texts in academia, which includes electronic versions of dissertations and the gradual recognition of electronic journals as respected outlets for rigorous scholarship, suggests a continued expansion of multimedia forms into the mainstream of literate activity at all academic levels.

A further impetus to broadening the scope of literacy in relation to multimedia is the shift from viewing literacy primarily as a set of isolated, minimal, functional skills for reading and writing in schools: Literacy is a much larger sociocultural phenomenon that has implications for personal agency and for a nationalistic competitiveness and globalization. The imperatives for literacy, the definitions of its importance in world of the early twenty-first century, and the ideas about how it might best be developed have changed rapidly in both a technological and a sociocultural sense. Multimedia literacy, and the constellation of contemporary literacies that it encompasses, implies a broad conception of educational imperatives and an understanding that digital transformations of reading and writing go far beyond the development of technological competence.

Thus, multimedia means can be thought of as an orientation of perspectives and values about a variety of literate activities across the sociocultural spectrum. For example, in law and ethics it may mean a transformation of concepts such as plagiarism, intellectual property, and copyright. In government and politics it may mean a transformation

of the possibilities for shaping or controlling public opinion through the dissemination of information. In economics it may mean a transformation of commerce and how people purchase goods and services and how they manage their personal finances. In mass communication it may mean the transformation of how news organizations gather and disseminate information and who has access to it. In popular culture it may mean a transformation of the pragmatics of writing and reading texts such as determining what is acceptable and unacceptable when using e-mail. In education it may mean a transformation in what is considered a text, how texts are written and used, and ultimately perhaps the goals of education and the roles of teachers and students. Such potential transformations and how they might be accommodated in educational endeavors define the broad imperatives for considering literacy in terms of multimedia.

### Theory and Research

On a theoretical plane, it is challenging to define precisely the relation between multimedia and literacy. What exactly comprises literacy has always been debatable and has increasingly been so in light of sociocultural perspectives. But, defining precisely what is meant by the term *multimedia* is equally challenging. That challenge is reflected in what might be considered a grammatical redundancy or, at least, an ambiguity. Media is technically a plural form of the word *medium*, making multimedia somewhat redundant in a literal sense. Yet, media in popular usage has become a collective noun that originated in the field of advertising to designate agencies of mass communication. Whereas considering multimedia in relation to literacy may include an understanding and critical analysis of mass media in the collective sense, it implies much more in light of the digital forms of representation. That is, digital forms of representation often blend what might intuitively seem to be individual media into combinations heretofore not possible or feasible. Doing so, however, begs the question of where the boundaries are between media. Put another way, what precisely is a medium? Is a medium elemental in terms of a perceptual mode? That is, might audio and visual presentations be different media? Or, is a medium defined in terms of its technological materiality? That is, the writing of a conventional essay with pen, pencil, typewriter, or word processor employs the use of distinctly different media with potentially dif-

ferent effects. Or might a medium be defined in terms of technological capabilities? That is, a picture or video on a television and computer screen may be identical in appearance, but they are not necessarily equal in their potential opportunities for viewer interaction, and might, thus, be considered different media. Or, does identifying an individual medium require considering all these differences in some ill-defined way? Addressing these and similar questions and issues may be important in translating how literacy might be seen in terms of multimedia into agenda for practice and for research. In other words, knowing what a medium is and what individual media, if any, comprise a means of communication seem fundamental to understanding literacy from the perspective of multimedia and how such literacy might be developed.

In 1979 Gavriel Salomon offered a well-developed and often-cited theory of media and learning relevant to these questions and issues, and it illustrates the type of theory that might be useful. It is useful in part because it transcends more superficial, popular definitions of media that are linked to longstanding forms of communication, and it more readily recognizes and accommodates rapid changes in the technologies of communication. In his scheme a medium can be defined, and thus analyzed and reflected upon, as a configuration of four elements: symbol systems, technologies, contents, and situations. Symbol systems and the technologies used to present them are intertwined and critical because they define the cognitive requirements for extracting information from a medium and consequently what skills become necessary for those who wish to use the medium successfully. In this view, a conventional musical score and a topographical map are different media because they require different cognitive skills for extracting information. Symbol systems and technologies also importantly set the limits of the degree to which a medium can assist those who do not have the requisite skills to extract useful information. For example, Salomon demonstrated that the technological capabilities of the film camera (now also the video camera), specifically the capability to zoom in for a close-up, could increase attention to relevant detail among learners who had difficulty doing so on their own. Contents and situations, the remaining components that define a medium, are more socially defined correlates than necessary qualities of individual media. For example, textbooks rarely have overt advertisements (con-

tents), although they could, and breaking news events are rarely viewed in a movie theater (situations), although they indeed used to be. Thus, among its other advantages, this theoretical perspective accommodates both cognitive and sociocultural dimensions of multimedia and literacy.

There are other relevant theoretical perspectives that might define multimedia and guide research. Research and practice in relation to multimedia literacy has frequently been ad hoc and atheoretical, however. Further, within mainstream literacy research there have been relatively few published studies guided by an awareness of new technologies and media. The body of research focusing on literacy is overwhelmingly aimed at the conventional use of printed materials. However, three studies illustrate the range of possibilities for research in this area and the type of approaches that may lead to important understandings about literacy in terms of multimedia, including learning from texts, integrating multimedia into instruction, and expanding students' sociocultural awareness of textual information. For example, in 1991 Mary Hegarty and colleagues used a cognitive perspective to demonstrate how students with low mechanical ability learned more from text describing a machine when its operation was animated on a computer screen than when it was shown as a series of static pictures in a conventional printed text. Ruth Garner and Mark G. Gillingham, using case studies, documented in 1996 how literate activity as well as the roles of teachers and students changed when e-mail and Internet access were introduced into classrooms. Jamie Myers and colleagues described in 1998 how involving students in creating multimedia hypertexts about literacy and historical figures such as Pocahontas led to a critical stance toward various sources of information.

### Further Thoughts

For the early twenty-first century, considering literacy in terms of multimedia relates directly to important changes and trends in conceptions of literacy beginning in the late twentieth century. This perspective makes particularly poignant the shift from printed to digital texts and the implications of that shift for reconceptualizing literacy in light of new and diverse modes of communication. Yet, incorporating multimedia into conceptions of literacy remains imprecise and has yet to provide an unambiguous guide for theory, research, and practice.

#### NARRATIVE COMPREHENSION AND PRODUCTION

Narratives convey causally and thematically related sequences of actual or fictional events. Narratives have a hierarchical schematic structure. At the highest level, they consist of a setting, a theme, a plot, and a resolution. The components of the setting are

characters, a location, and a time. Thus, the typical opening sentence of a fairy-tale, “Once upon a time in a far-away kingdom, there was a princess who . . .” conveys the setting in a nutshell, as does the more colloquial “Last night I was at a restaurant when . . .”. The theme can consist of a goal (the princess wanted to get married) or an event and a goal (a fire broke out at the restaurant and I was trying to call 911). The plot is a causally related sequence of events, usually describing the character’s attempts to achieve his or her goal. The resolution describes the achievement of the character’s goal. Of course, many literary narratives omit the resolution. An example is Samuel Beckett’s play *Waiting for Godot* (1953), whose main characters, Vladimir and Estragon, are waiting for a third character, Godot, to arrive. But Godot never arrives, thus spawning decades of literary analysis about the meaning of the play. However, most stories exhibit the stereotypical structure described above.

Aristotle in *Poetics* identified the plot as the major organizing structure of narratives and admonished poets to describe events only when they are relevant to the plot, just as Homer had done centuries before them. They were to refrain from giving a blow-by-blow chronological account of an episode. This Aristotle considered to be the province of historians.

### Cohesion and Coherence in Narratives

In order to make sense, narratives need to be cohesive and coherent. Two successive sentences are said to be cohesive when they share information, as indicated by linguistic markers, such as pronouns or connectives. Thus, the sentence pair in (1) is cohesive because the pronoun *he* in the second sentence refers back to the runner mentioned in the first sentence.

(1) The runner jumped over the puddle. He did not want to get his feet wet.

On the other hand, the sentence pair in (2) is not cohesive; there is no word in the second sentence that directly refers back to the first.

(2) The runner jumped over the puddle. It is unpleasant to get your feet wet.

Yet, sentence pair (2) does seem to make sense: The second sentence provides a motivation for the action in the first sentence. Thus, the two sentences can be connected by generating a bridging inference. A sentence pair like (2) is said to be locally coherent. Now consider sentence pair (3).

(3) The runner jumped over the puddle. Airplanes seldom leave on time.

This pair is neither cohesive nor locally coherent (i.e., it is not easy to generate a bridging inference). Thus, the connection between successive sentences can be established through cohesion markers or through bridging inferences (or a combination of the two). Is this sufficient to produce a coherent text? Consider the following passage.

The runner jumped over the puddle. There were some frogs in the puddle. Frogs are often used as characters in fairy tales. Fairy tales are narratives. This entry is about narratives.

Although this “text” maintains local coherence—each sentence can be connected with its predecessor—it lacks an overall point. Thus, an important characteristic of narratives is that they have an overarching point or theme. This is called global coherence.

### Empirical Approaches to the Study of Narrative

Cognitive psychologists have been able to uncover a great deal about how people understand narratives by assessing, among other things, what people recall from a story, how quickly people read certain words or sentences, or how quickly they respond to probe words. For example, it is clear that people use their expectations about the stereotypical structure of stories when understanding a story. It is also clear that people make inferences about the motives behind characters’ actions and about the causes of events when these are not explicitly stated in the text in order to establish both local and global coherence. Consider the two sentence pairs below.

(5) The spy threw the report in the fire. The ashes floated up the chimney.

(6) The spy threw the report in the fire. Then he called the airline.

In sentence pair (5) the bridging inference that the report burned is needed to establish local coherence between the two sentences, but in (6) no such inference is needed because of the cohesive link between *spy* and *he*. In experiments, participants respond more quickly to the probe word *burn* after sentence pair (5) than after sentence pair (6), suggesting that the inference about the report burning was activated during the reading of (5) but not during the reading of (6).

There is a wealth of evidence that comprehenders do more than simply generate bridging in-

ferences to connect sentences. What they do is construct mental representations of the situations that are described in the text, situation models, rather than just mental representations of the text itself. Consider sentence pairs (7) and (8).

(7) Mike started playing the piano. A moment later, his mother entered the room.

(8) Mike stopped playing the piano. A moment later, his mother entered the room.

Participants in experiments responded more quickly to the probe word *playing* after sentences such as (7) than after sentences such as (8). The reason for this is that in (7) Mike is still playing the piano after his mother has entered, whereas in (8) he is not. Thus, in (7) playing the piano is still part of the situation, but in (8) it is not. If the subjects were merely constructing representations of the texts, no difference should have been found, given that the word *playing* appeared in both texts.

### Narrative Production as a Window into Comprehension

Writing involves cognitive operations that are the result of thinking, such as collecting information, generating ideas, turning these ideas into written text, and reviewing the text for its meaningfulness. In narratives, the thoughts, perceptions, fantasies, and memories of the writer are incorporated in a coherent narrative structure, either in oral or written language.

Knowledge of the prototypical structure of a mode of discourse is important for its construction and comprehension. A narrative about a major disaster, such as the explosion of the *Challenger* shuttle, will be written and processed in a different manner than a newspaper article about it. Whereas a newspaper article will focus on the facts, a narrative would include other elements, such as a plot and a narrator or a character-based perspective leading the reader through the sequence of events. The comprehension strategies of a narrative or a newspaper article about the explosion will be different as well, with a stronger focus on stylistic aspects and smaller focus on criteria of truth when using literary comprehension strategies than when using expository text comprehension strategies.

Although the boundaries between narratives and other forms of discourse are not clear-cut, narratives share certain features, such as a narrative structure that enables the reader to seek meaning

and generate meaning from the narrative, and a potential to have an emotional impact on the reader or listener.

### Affective and Esthetic Aspects of Narrative Comprehension and Production

Most narratives possess a dramatic quality that is created from an imbalance between narrative components, for instance different characters with opposing goals or a sequence of events leading to a tragic outcome for one of the characters. The dramatic quality as well as the style of the narrative will draw the reader into a convincing fictional world of goals, emotions, and motivations. Narrative style will stir the reader's imagination. For example, foregrounding of narrative elements, such as references to the devil in Elizabeth Bowen's *The Demon Lover* (1959), will aid the reader in imagining the true nature of the relationship between the main characters.

An imbalance in the sequence of events can affect the emotional response of the reader, in particular suspense, curiosity, and surprise. According to the structural affect theory, suspense is evoked by postponing the narrative's outcome, thereby creating uncertainty for the reader on the issue of what is going to happen next in the narrative. Curiosity arises when the outcome of the narrative is presented before the preceding events, whereas surprise occurs as a result of an unexpected event in the narrative, such as the sudden appearance of the pawnbroker's half-sister when Raskolnikov kills the pawnbroker in Dostoyevsky's *Crime and Punishment* (1866).

The kinds of emotions that readers experience while reading or listening to a narrative can be the result of being drawn into the fictional world of the narrative and identifying with the characters. These emotions are called "fictional emotions." Reader emotions can also be the result of analyzing and appreciating the narrative structure and techniques, called "artifact emotions" by Eduard Tan. The overall enjoyment of reading the narrative is based on both types of emotions. Narrative techniques, in particular switches in the role of narrators, can be used to make the reader go from observation to identification in different parts of the narrative or throughout the narrative.

### Comparisons of Narratives in Different Cultures

Apart from being entertaining, many narratives also reflect moral values as a commentary on a society,

include the preservation of events central to a culture, or aim to create an identity of a group. A culture is a shared perspective regarding ways of life and symbolic systems maintained within a social group. Narratives can help to establish an identity in a multicultural context, such as postmodernist literature, or preserve or create a group's identity within one culture, such as feminist poetry or Navajo narratives. Group identity is especially important for minority groups within a multicultural society. These groups share common interests and customs that act as a basis for constructive memory to be passed on to future generations.

The preservation of cultural elements from a group and the manner in which they are delivered can be one focus of narratives in cultural groups. Many Native American narratives preserve and transfer cultural traditions and tribal discourse through oral techniques of pause, pitch, and tempo. Another focus of narratives in cultural groups is the reflection of moral and aesthetic values within those groups. This can be the result of exclusionary mechanisms from a dominant cultural group that urges minority cultures to develop their own means of literary production and aesthetic norms with their own unique features. The incorporation of blues lyrics in African-American poetry is unique to that group, as is the inclusion of the native or modified language into poems and narratives in Chicano, Caribbean, and African-American cultures.

Narrative production and reception in one culture will strengthen and preserve the aesthetic norms and traditions within that culture. For individuals from other cultures, reading or listening to these narratives may help to translate these specific cultural elements into their own experiences and provide a better understanding of cultures and cultural issues other than their own, such as the dual personality issue in Chinese-American and Japanese-American culture. The narrative structure and the elicitation of fictional and artifact emotions will help this process. As Eileen Oliver suggests, part of the reception process may be that readers and listeners become more aware of the dynamics of cultural exchange in which assimilation, retention, and transformation of new cultural features are in constant progress.

## VOCABULARY AND VOCABULARY LEARNING

How does one help students learn vocabulary? Solutions take two general directions: one focuses on learning word meanings from context through wide reading and the other on the need for direct instruction about word meanings.

### What Is Known and How to Know It

The divergent recommendations of wide reading versus direct instruction derive from different assumptions about the extent of vocabulary knowledge, that is, how many words children typically know, and how readily new words are learned. For example, rapid word learning and large vocabularies would indicate a lesser role for instruction, while slower growth would indicate need for intervention.

**Vocabulary size and growth.** A key issue is that estimates of vocabulary size vary widely. For example, estimates of total vocabulary size for first graders have ranged from about 2,500 (Edward Dolch and Madorah E. Smith) to about 25,000 (Burleigh Shibles and Mary Katherine Smith), and for college students from 19,000 (Edwin Doran and Edwin Kirkpatrick) to 200,000 (George Hartmann).

Situations with such wide variations make it impossible to simply ask people how many words they know, so estimates must be based on testing people's word knowledge of a sample of words and extrapolating to a final figure. To construct such tests, decisions must be made about what is taken as evidence of knowledge of a word, what constitutes a single

word (e.g., should individuals who know the word *walk* be credited with knowing the word *walking*?), and how a sample of words is chosen to represent the language. All these decisions open the door to wide discrepancies in vocabulary size estimations.

Work on what constitutes a word and on techniques for constructing a language sample have helped bring estimates into greater agreement. Consequently, estimates in the early twenty-first century place vocabulary size for five- to six-year-olds at between 2,500 and 5,000 words. But although the problems of older work on vocabulary size are understood, there are (as of 2001) no recent, large-scale studies that correct these problems.

Estimates of vocabulary size at different ages are also used to estimate rates of vocabulary growth. Specific estimates of vocabulary growth, not surprisingly, vary widely, from three (Martin Joos) to twenty new words per day (George Miller). A figure of seven words per day is probably the most commonly cited.

Whatever the reality, it is certain that there are wide individual differences in both vocabulary size and growth. Studies have found profound differences among learners from different ability or socioeconomic groups, from toddlers through high school. For example, Mary Katherine Smith reported that high-knowledge third graders had vocabularies about equal to lowest-performing twelfth graders. These differences, once established, appear difficult to ameliorate. This is because children whose backgrounds provide rich verbal environments not only learn more words initially, but they also acquire understanding about language that enables them to continue to learn words more readily.

**Learning from context.** Most word meanings are learned from context. This is true from the earliest stages of a child's language acquisition onward, but the type of context changes. Early learning takes place through oral context, while later vocabulary learning shifts to written context. Written context lacks many of the features of oral language that support learning new word meanings, features such as intonation, body language, and shared physical surroundings. Thus, written context is a less efficient vehicle for learning. Research shows that learning from written context occurs, but in small increments. Machteld Swanborn and Kees de Glopper estimate that of one hundred unfamiliar words met in reading, between three and eight will be learned.

Thus, students could substantially increase vocabulary if two conditions are met. First, students must read widely enough to encounter a substantial number of unfamiliar words. Second, students must have the skills to infer word-meaning information from the contexts they read. The problem is that many students in need of vocabulary development do not engage in wide reading, especially of the kinds of books that contain unfamiliar vocabulary, and these students are less able to derive meaningful information from context. So depending on wide reading as a source of vocabulary growth could leave some students behind.

**Direct instruction.** The most commonly cited problem with direct instruction to address students' vocabulary needs is that there are too many words to teach. This is certainly true if the goal is to teach all the words in a language. Consider, however, a mature vocabulary as comprising three tiers. The first tier consists of basic words—*mother, ball, go*—that rarely require instructional attention. The third tier contains words of low frequency that are typically limited to specific domains—*isotope, peninsula, refinery*. These words are appropriate for specific needs, such as introducing the word *peninsula* during a geography lesson. The second tier contains high frequency, general words, such as *compromise, extraordinary, and typical*. Because of the large role tier-two words play in a language user's repertoire, instruction directed toward these could be valuable in contributing to vocabulary growth.

What kind of instruction should be offered? The answer depends on the goal. Typically, educators want students to know words well enough to facilitate reading comprehension and to use the words in their own speech and writing. Facilitating comprehension seems a reasonable goal, given the well-established relationship between vocabulary knowledge and comprehension. Although virtually all studies that present vocabulary instruction result in students learning words, few have succeeded in improving comprehension. In analyzing this discrepancy, researchers, such as Steven Stahl and Marilyn Fairbanks, found that to influence comprehension instruction needs to: (1) present multiple exposures of words; (2) involve a breadth of information, beyond definitions; (3) engage active processing by getting students to think about and interact with words.

Effective instruction should accomplish the following:

- Begin with information about the word's meaning, but not necessarily a formal definition.
- Immediately prompt students to use the word.
- Keep bringing the words back in a variety of formal and informal ways.
- Get students to take their word learning beyond the classroom.
- Help students use context productively.

### Status of Vocabulary Issues

Although there is general consensus on effective vocabulary instruction, little of this kind of instruction is found in classrooms. Attention to vocabulary in classrooms focuses on looking up definitions and perhaps writing sentences for new words. The typical dictionary definitions, however, do not promote students' learning of new word meanings. In fact, often students do not even understand the definitions of the words they look up. Thus it is important to implement what is known about effective instruction into classrooms.

Much about the way vocabulary is learned and stored in memory is still unknown. How much learning comes from oral contexts past initial stages of acquisition? How much do early learning experiences matter and is it possible for children who lag early to catch up? What characteristics of verbal environments are most useful for word learning? For example, what are the roles of the amount of talk in a child's environment, the kinds of words used, and interactions within the environment? How is word knowledge organized? Research makes it clear that a person's vocabulary knowledge does not exist as a stored list of words, but rather as networks of relationships. This leads to the question, how do these networks of word relationships affect how readily and how well words are learned?

To help students improve their vocabulary, it will be necessary to put into practice what is already known about vocabulary learning and evaluate and refine the results.

## WRITING AND COMPOSITION

Skills or process? Visible in the history of writing instruction is the same controversy found in the rest of the language arts. Historically, writing instruction focused on handwriting and on correctness of the product produced through emphasis on what are sometimes referred to as the mechanics of writing (i.e., sentence structure, spelling, correct punctuation, etc.) and on rules. Students were usually asked to write to assigned topics or for purposes such as essay exams. They were seldom asked to write for an audience other than the teacher and the quality of the writing was much more likely to be judged on the basis of the correctness of its content and mechanics than on style or creative expression of ideas.

### Writing Process Instruction

Gradually research began to make visible the processes of writing. With the writing project movement in the mid- to late 1970s concern for teaching the writing process emerged as a strong force. In the early stages of that movement the process was often described in a linear fashion as a series of four steps: pre-writing, writing, editing, and revision. Over time those concerned with writing instruction came to recognize and acknowledge through instruction that real writing is a much more messy reflexive and recursive process. With this understanding came the push to encourage students to write on topics of their own choosing, write for their own purposes, and perhaps most significantly, write to real audiences. As with most swings of the educational pendulum, by the late 1980s writing instruction in some schools had reached an extreme point where students might write exclusively in the genre of their choice and where attention to mechanics was seldom taught and/or required, even in pieces for publication.

During the 1990s politicians and the public at large increasingly called for rigorous academic standards and writing instruction shifted once again. In the early twenty-first century, teachers of writing or composition typically try to balance their desire to

have students engage in writing in which they are personally invested, with the challenges of attention to correctness issues and to writing in a range of genres. Often these demands are tied to distinguishing between private and public writing. When the intended reader is an audience other than the author, the needs and expectations of that reader must be addressed if the writer's work is to be positively received.

With these shifts in the view of the writing process came the realization that the idea that *writing is writing* is not valid. That is, each discipline, indeed each piece of writing, has its own demands in terms of genre, audience, purpose, situation, and even what is viewed as correctness. This realization, coupled with the belief that engaging in writing can influence cognitive development, led to the writing across the curriculum movement, resulting in pressure on all teachers, not just English or Language Arts teachers, to be teachers of writing. After all, which teacher is better prepared to help students develop the genre of lab report writing, the chemistry teacher or the English teacher? Accompanying this movement has been increased emphasis on tying reading and writing instruction together.

### Technology As Tool

Within a decade of the emergence of the writing process movement, technology began to exert a significant influence on writing instruction. Early arguments centered around whether or not classrooms (especially elementary classrooms) should have a computer, and how or even if that computer should play a role in language arts instruction. Some argued for placing computers in one centralized lab, which students would visit as a whole class once or twice a week, rather than distributing computers across classrooms. Most of the educational software available by the mid-1980s provided little more than computerized versions of skill drills or workbook sheets, occasionally accompanied by programs to teach typing or rudimentary word processing. Even under these less than ideal circumstances, students and teachers recognized the potential of technology for contributing to the writing process. When one fourth grader was asked how the computer helped her to revise she stated succinctly, "you don't have to worry about the paper ripping." What she and others recognized was the power of technology to assist writers with the physical process of encoding their messages so that more time and effort could be given to the composing process.

While educators were arguing about if or how computer technology should affect classrooms, technology was continuing to evolve at a rapid pace and the accessibility of affordable computers outside the classroom soon rendered the argument moot. Children who came to school computer literate were supported by their parents in expecting (sometimes demanding) similar access at school. The impact on the school writing curriculum was profound, with computer literacy quickly becoming a major issue for both students and teachers.

As computers have become more affordable and pervasive in society at large they affect not just formal writing instruction in K–12 schools, but also instruction in other educational venues. Adult education and community college programs offer a variety of classes and programs aimed at developing computer literacy in a wide range of students and for a huge variety of uses. Colleges and university now typically expect their students to be computer literate, even in some cases providing or requiring a personal computer for each entering student.

### **Technology in Development of Writing and Composition Skills**

These new writing technologies provide new choices and, in some cases, have led to a shifting emphasis in the development of writing abilities. Where there previously was an emphasis on traditional (paper-and ink-based) products and processes, there is now an emphasis toward an evolving set of products and processes enabled by electronic technologies. Handwriting is no longer an issue. To a large extent issues of mechanics (e.g., spelling, grammar) are taken care of by employing the computer as editor.

At the same time, shifting definitions of literacy have affected technology and software use in educational settings. Moving from the early days of computer drills and grammar checkers, to expressive freewriting or “invisible” writing on computer screens, to cognitive-based heuristic programs, to social functions of networked writing, technology use in writing instruction has mirrored the important theoretical and empirical approaches to teaching writing in traditional classrooms. This emphasizes a shift from viewing writing technology as a tool for delivering instruction to a technology that engages students as socially interactive participants. A new genre of writing with its own vocabulary and conventions has been born through such technology-related venues as e-mail, chat rooms,

listservs, and MOOs (Multiple User Dimensions/Object Oriented, which arose out of online game-playing in text-based virtual reality environments). Writing in hypertext, with its ability to link writing through the click of a pointing device, is one example of this powerful new interactivity for writers and readers.

Traditional writing concerns such as understanding purpose and the importance of audience awareness have a renewed emphasis in technologically rich writing environments. Some teachers have successfully used technology to show students the importance of these traditional writing concerns in a writing environment with social relevance to students’ lives. For example, discussions about audience naturally follow when writing is published on the Internet, whether to a known audience, as in personal e-mail, or a potentially unknown audience, as part of a website. Likewise, purposeful writing is given new importance when writers communicate with readers via electronic mail, electronic bulletin boards, synchronous discussion, or web sites—how readers interpret meaning in these contexts may shift, and students writing electronically need to carefully consider the crucial role of purpose in their writing.

Although issues of organization and style have always been important aspects of writing and composition (though sometimes underemphasized instructionally), technology provides a myriad of new options for writers to consider. Issues that previously were the concern of copy editors, publishers, and graphic artists have become the concern of authors. Developing writing skills in technologically rich environments may include elements of visual literacy skills, such as using graphics or integrated images within a text. Word processing and publishing software give developing writers the option, or in some cases the need, to learn about document design as it relates to writing. Composing in hypertext allows the writer to insert links from one part of a document to another, or if the document is made available online, writers can link to different texts and sites available over the network. Whether a document is composed on a word processor or marked-up for World Wide Web publication, writers are presented with previously unavailable choices of font styles, sizes, colors, and other symbols, including moving or still images and graphics. Writers can vary patterns of organization manipulating texts using electronic “cut and paste” tools, and writing in

hypertext offers a nearly infinite number of organizational options controlled, in part, by the reader.

Taken together, these new choices and shifting emphases represent a changing literacy landscape. In this new context, writing instruction continues to evolve as the uses and processes of writing change.

## LITERACY AND CULTURE

Literate practices are learned within dynamic cultural systems that structure roles and scripts (alphabetic, pictographic), privilege modes of reasoning, and offer tools through which such practices may be carried out. In modern, often Westernized, societies, these tools include books, newspapers, magazines, film, digital technology, and television. Historically, the advent of new technologies—such as the printing press—made possible new explorations of literacy and opportunities for more people to become literate. With greater global immigration, more students for whom English is a second language are entering U.S. classrooms. In some cases both U.S.-born and immigrant populations are involved in literate practices that operate under different assumptions than those that characterize school-based literacies. The digital age in particular offers opportunities to many more people to self-publish, create and interpret multimedia texts, privilege non-linear approaches to reading, for example, in hypermedia texts, engage in visual as well as oral communication across borders, and access rich databases internationally. These and other advances are ushering in new kinds of literate practices that now challenge schools to learn to integrate them meaningfully and to provide equitable access across groups. This entry will focus on literate practices defined by ethnicity (including language use) and by academic discipline, considering their implications for classroom instruction and student learning.

Induction into literate practices involves socialization in the ability to decode scripts and to reason in patterned ways. People demonstrate their membership in literate communities through ways they use language—knowing the right lexicon, the structure of appropriate genres, as well as when, where, and how talk should proceed. In reading and writing, such cultural models may be influenced by ethnicity, nationality, disciplines, and professions. Reading literature, for example, requires one to infer motives, goals, and internal states of characters based not only on clues from the text, but also from one's reading of the social world. Reading primary historical texts requires readers to invoke disciplinary norms, questioning the point of view of the author, drawing on knowledge of historical contexts. Some challenges that students face in literacy instruction derive from differences between community-based cultural models and school-based literacies.

### Cultural Conflicts in Classroom Practices

Schools are seen as the repository of “standard” English, which is assumed to be the proper medium of communication for advancement in the marketplace and the academy. Not only is the standard a historically moving target (syntactical and lexical forms considered proper, say, in eighteenth-century Great Britain or the United States are considered archaic and inappropriate in the twenty-first century); in addition, certain syntactic markers have different values. For example, “It is me” is not considered “improper” English (as opposed to the “standard” form “It is I”), whereas “It be me,” a marker of African-American Vernacular English (AAVE) is seen as “incorrect.” In the 1970s researchers documented how students of color, English Language Learners (ELL), and students living in low-income communities were marginalized through classroom practices, particularly in the area of literacy instruction.

Susan Phillips’s work helped the field to understand how opportunities to participate in instruction were actualized in classrooms. She examined relationships of power that are constructed through norms for talk in classrooms. She documented the conflicts between norms for talk in the Navajo Nation and ways Anglo teachers expected Navajo students to participate. Using Anglo norms, teachers interpreted long stretches of silence by Navajo students as evidence that students were not learning.

In a similar vein other researchers, such as Courtney Cazden and colleagues, documented how oral language practices by low-income African-American primary level students were interpreted as deficits rather than resources. The function of sharing time is to scaffold young children from oral storytelling to the production of features of the kinds of academic writing that they will be expected to produce in later grades. Teachers viewed the African-American children’s stories as ill formed and saw the students’ language as a deficit. By contrast, Sarah Michaels analyzed the children’s stories as fitting a different structure, which she termed topic-associative in contrast to the topic-centered stories of the Anglo children. James Gee extended Michaels’s analysis to claim that the topic-associative story structure included complex literary elements. The consequences of teachers’ abilities to recognize the literate features of children’s oral language has important consequences for the ways they are or are not able to extend the funds of knowledge that stu-

dents bring to classrooms in order to help students learn school-based ways of reading and writing.

Other research has found more African-American students employing topic-centered stories than topic-associative. Tempii Champion identified an array of narrative genres used by African-American children. Champion’s findings illustrate how children across different communities “take up various narrative styles, structures, and content [that] include formal instruction, informal instructional contexts, family contexts and others” (p. 72). If one moves away from the social address model that categorizes people into discrete cultural communities, one can understand the ways that children and adolescents, for example, traverse multiple cultural communities. In the process they adopt, adapt, and hybridize a variety of oral and textual genres that become part of their literate repertoires. They learn to engage such repertoires in different contexts, with different actors, for different purposes.

Language is central to literate practices. Research in bilingual education has explored how ELL use resources in the first language as they engage in reading and writing in the second language. When faced with a breakdown in comprehension while reading English texts, Spanish-speaking students, for example, would think in Spanish to repair comprehension. How a first language other than English may be drawn upon in support of school literacy often depends on how much formal schooling students had in the first language before entering U.S. schools.

Another area of study is literate practices of children and families outside school, shedding light on how schools can make connections with what students know and ways they learn that are not currently reflective in mainstream school literacy practices. The church in many low-income communities is a site for multilingual literate practices. For Spanish-speaking families, researchers documented literate practices associated with *doctrina*, catechism classes for children that involve reading and writing extended texts in both Spanish and English. Beverly Moss documents the oral as well as reading-writing practices in African-American Christian churches. For example, call and response is a dominant discourse pattern in black churches that requires the audience to attend closely to nuances of the delivered text and invites a high level of engagement by the audience. However, call and response is seldom invoked in

classrooms serving African-American students (Carol Lee reports exceptions).

Schools value children's emergent literacy experiences outside school as preparation for learning to read, write, and speak. Reading books to young children at home is seen as an important predictor of future school success and white middle-class patterns of storybook reading are considered a norm that all families should emulate. However, Carol Schneffer Hammer reports both low-income and middle-class African-American mothers employing an interactive storybook reading style different from the white middle-class model. These mothers did not employ a question-asking routine but were still able to elicit appropriate language responses. Others have noted the value of oral storytelling as an emergent literacy practice, with an emphasis on its performative features; comparable mismatches with low-income Anglo students, particularly Appalachian students, have also been documented.

Many communities and individuals grapple with the question of which community-based language and literate practices to abandon in order to succeed in school. Ethnic and language cultural communities are not homogeneous in their response to this challenge. For immigrant populations, socioeconomic status and the number of generations removed from the country of origin are the most significant factors. Gail Weinstein-Shr documented two Hmong communities in Philadelphia with very different orientations toward cultural integration into U.S. "mainstream" values. Daniel McLaughlin has reported similar debates regarding reading and writing in Navajo versus English.

Community-based literate practices in low-income neighborhoods often involve reading functional and religious texts, and forms of writing such as letters, lists, and journals. Such reading and writing often involve both English and the community-based language. By contrast, the standards movement in literacy focuses on longer and discipline-based texts. Basil Bernstein characterizes language practices of working-class students as localized to the immediate context and not characterized by the more abstract and generalizable strategies that many associate with school-based literacies. The counter-voice to this position argues that literate practices are always context bound, socially co-constructed by the participants.

### **Culturally Responsive Pedagogy as Zones of Proximal Development**

Lower literacy achievement rates for African-American, Latino, some Asian-American, and most low-income students have been attributed to three sources: cultural mismatches between instruction and the backgrounds of students; structural inequalities in the society manifested in the organization of and resources allocated to schools serving these populations; and ineffective instruction that is not based on enduring best practices. Culturally responsive pedagogy (CRP) is one response that addresses cultural mismatches directly and often addresses macro-level structures indirectly.

Studies of culture and cognition show that through repeated and patterned experience in the world, we develop schema through which we filter future experiences. New learning is strongest when we are able to make connections to prior knowledge. CRP explicitly fosters connections between students' cultural funds of knowledge and disciplinary knowledge to be learned.

This approach is particularly relevant to literacy because both language use and socially shared knowledge are central to acts of reading and writing. In addition, CRP often structures ways of talking that appropriate cultural norms for discourse from students' home communities. Examples below illustrate CRP focusing on generic reading and writing.

A classic example is the KEEP Project with Native Hawaiian children. Discussions of stories read were structured to resemble Talk Story, a community-based genre that involved multiparty overlapping talk. Students achieved significant gains in reading. Luis Moll coined the phrase "cultural funds of knowledge" in an ethnographic investigation of routine practices in a Mexican origin community in Tucson, Arizona. Moll documented ways adults in the community engaged in practices involving carpentry, plumbing, and other skills, and the literate practices embedded in them. He then designed an after-school structure that allowed teachers to learn about these practices and forge relationships with community residents, resulting in teachers' incorporation of adult mentors in the classroom. Students learned to build projects around the cultural practices of the community, each requiring extensive reading, writing, and speaking.

Other work with ELL focuses on the competencies children and adolescents develop as language

brokers, translating in high-stakes settings for their parents. Translating involves negotiating across different codes, understanding appropriate registers, anticipating audience, negotiating perspective, and often involves reading and writing in two languages.

The Fifth Dimension Project (FD) is a network of after-school computer clubs operating nationally and internationally. Through play, adults and children together work their way through a maze by developing competencies in commercial computer games and board games. The children are low income, many ELL for whom Spanish is the language used at home. Literate practices involve reading game instructions, writing to a mythical wizard who responds to questions, and communicating orally and in writing to others. Through this project children have structured access to multiple mediational means—invited use of English and Spanish/AAVE, and so forth, peer and adult mentors, the mythical wizard, and opportunities to move fluidly across roles. FD students have shown significant increases in reading achievement, despite the fact that didactic teaching of reading and writing are not the focus of the intervention.

Carol Lee has developed a design framework for CRP called Cultural Modeling (CM). CM has focused on response to literature and narrative composition. CM works on the assumption that students—in this case speakers of AAVE—already tacitly engage in modes of reasoning required to interpret literary tropes and genres. Instruction engages students in what Lee calls metacognitive instructional conversations where the focus is on how students know, for example, that rap lyrics are not intended to be interpreted literally, and what clues/strategies students use to reconstruct the intended meaning. In addition, in CM classrooms—with African-American students—classroom discourse reflects AAVE norms with overlapping multiparty talk, high use of gesture, and rhythmic prosody. In CM classrooms, high school students with low standardized achievement scores in reading display very complex literary reasoning with rich, canonical texts. A. F. Ball found secondary African-American students displayed in their writing a preference for a set of expository features that are rooted in what Geneva Smitherman has called the African-American Rhetorical Tradition. Smitherman found that the presence of these features correlated positively with higher evaluations on National Assessment of Educational Progress samples.

CAROL D. LEE

## LITERACY AND READING

The terms *literacy* and *reading*, though related, are neither synonymous nor unambiguous. Typically reading is subsumed by literacy, with the latter term referring to reading, writing, and other modes of symbolic communication that are valued differently for social, economic, and political reasons often imposed by a dominant culture. Simply broadening the definition, however, does not alleviate the ambiguity. For instance, the assumption that literacy exists

in the singular has been criticized by Brian Street in 1995 and others for ignoring the socially situated aspects of one's multiple literacies (print, nonprint, computer, scientific, numeric) and their accompanying literate practices.

A preference for literacies, as opposed to literacy in the singular, also signals a critique of the autonomous model of reading that has dominated Western thinking up to the present. It is a model that views reading largely from a cognitive perspective—as a "natural" or neutral process, one supposedly devoid of ideological positioning and the power relations inherent in such positioning. Conceiving of literacies in the plural and as ideologically embedded does not require giving up on the cognitive aspects of reading. Rather, according to Street, the ideological model subsumes the autonomous model of reading in an attempt to understand how reading is encapsulated within broader sociocultural structures (schools, governments, families, media) and the power relations that sustain them. This focus on literacies and reading as social practices within various contexts is central to untangling the "realities" (the so-called knows), unsupported assertions, and controversies that surround the practices.

### Realities

Definitive paradigm shifts since the last quarter of the twentieth century have marked transitions from behaviorist to cognitivist to sociocultural models of the reading process. Although these changing conceptions have altered how researchers and practitioners think about the reading process generally (and instruction, specifically), overall the field has remained largely focused on two major topics: reading acquisition and comprehension. This is not to say that other topics have been neglected. For instance, sufficient evidence exists for linking reading directly and inextricably to writing, such as the work of Robert Tierney and Timothy Shanahan, and Ian Wilkinson and colleagues; and other evidence connects various instructional practices to students' reading engagement and motivation to learn content, such as that of John Guthrie and Allan Wigfield. In terms of sheer quantity of research findings, however, the focus remains on reading acquisition and comprehension.

### Reading Acquisition Research

Reading acquisition is no longer seen as the sole responsibility of the school; nor is it viewed as a "lock-

step” process that moves from oral language development (speaking and listening) to print literacy (reading and writing). Currently, learning to read is viewed as a developmental process, one that emerges gradually from the time a child is born. The role of the family is paramount in fostering a child’s growth in language and in creating a literacy-rich environment. Parents, educators, researchers, and policymakers constantly look for ways to provide all children with access to the world of print, largely because knowing how to read and knowing what to do with information gained from reading is thought to be key to a child’s future well-being.

The Report of the National Reading Panel in the year 2000, a major reference for U.S. education policymakers, is an evidence-based assessment of the experimental and quasi-experimental research literature on reading. The National Reading Panel (NRP) used strict selection criteria in analyzing a comprehensive body of research that focused primarily on early reading and reading in grades three to eight, with the research being limited to studies published in peer-reviewed journals written in the English language. One of the panel’s goals was to report how instruction in phonemic awareness, phonics, and fluency impacts children’s early reading development and achievement in school settings.

**Phonemic awareness.** Phonemic awareness and knowledge of the alphabetic principle (commonly known as letter recognition) are said to be the best school-entry predictors of a child’s success in reading during the first two years of schooling in an alphabetic language, such as English. Phonemic awareness is not an innate skill; it can and must be taught. Children are said to be phonemically aware when they are able to manipulate phonemes (the smallest sound units of a word that impact meaning) in spoken words. The NRP found that children (regardless of socioeconomic class) who received between fifteen and eighteen hours of phonemic awareness instruction, prior to being taught how to read and/or before entering the first grade, benefited greatest from such instruction.

**Phonics.** Unlike phonemic awareness, which refers to the blending and pulling apart of the various sounds that make up spoken words in an alphabetic language, phonics refers to the sound-symbol correspondences in that language. Phonics is a tool for decoding words; it is not a reading program. Knowledge of phonics does not ensure that one will com-

prehend printed texts because reading is a far more complex process than simply sounding out words.

The NRP concluded that children (regardless of socioeconomic class) who receive systematic phonics instruction in kindergarten and first grade show greater improvement in word recognition skills than do children who receive no such instruction; however, phonics instruction after first grade does not significantly contribute to gains in children’s word recognition abilities. The panel also concluded that the type of systematic phonics instruction (e.g., synthetic, analytic, analogy) children receive, either individually or in small or large group settings, does not significantly affect the contribution such instruction makes to reading achievement.

**Fluency.** According to the NRP, phonemic awareness and knowledge of phonics are tools for helping children achieve fluency in reading. Fluent readers can decode words rapidly and accurately with good comprehension. Caution needs to be exercised, however, in interpreting these findings. Possessing well-developed word recognition skills—a condition often associated with having knowledge of phonics—does not necessarily translate into fluent reading. As the NRP pointed out, fluency is thought to develop when individuals have sufficient opportunities for, and practice in, reading. Typically, such practice is associated with independent or recreational reading both in and out of school. At this point, however, only correlational data exist to support the hypothesized connection between increased reading practice and improved reading achievement.

The NRP examined research on guided repeated oral reading practice as well as on methods that attempt to increase the amount of time a child engages in independent and/or recreational reading. The panel concluded that explicit guidance during oral reading has consistent and positive effects on word recognition, fluency, and comprehension. However, researchers have yet to agree on the best approach for helping children achieve reading fluency. In sum, although many have applauded the efforts of the NRP for its concise compilation of relevant research pertaining to reading in schools, others have criticized the panel for failing to address the early learning that occurs before a child goes to school, and for failing to provide information about home support for literacy development. Still others have called attention to the fact that the studies the NRP selected for analysis did not address issues related to teaching

children whose first language is other than English how to read.

### Comprehension Research

Research on reading comprehension has been limited largely to print-based texts and various strategies for studying and learning from those texts. The NRP concluded that seven comprehension strategies (comprehension monitoring, cooperative learning, using graphic and semantic organizers, generating questions, answering questions, using story structure, and summarizing) are effective in helping students learn from text. Although the NRP reported trends supporting conventional wisdom that vocabulary instruction leads to improved comprehension, it offered no conclusive evidence on this point due to the limited number of studies that met its strict criteria for inclusion. Nor did the NRP draw conclusions about the most effective instructional methods for teaching vocabulary.

Caution needs to be taken in interpreting the NRP's findings. The report did not include research on second language reading and reading to learn in domain-specific areas. Nor did it include studies using qualitative research designs, the absence of which severely limits what can be known about the contexts in which instruction occurred. Moreover, six of the seven comprehension strategies that were considered effective were ones that teachers would use if they believe reading comprehension consists of students working individually to extract information from printed texts. This rather narrow view of comprehension instruction risks disenfranchising students who may learn better in more socially interactive settings or whose literacies span a broader range than those typically associated with school or assessed by traditional reading measures.

Beyond strategic knowledge, readers who possess and activate relevant prior knowledge, who demonstrate an awareness of text structure, and who apply appropriate metacognitive skills to comprehending texts are more proficient learners than those who either do not possess such skills or who lack appropriate background knowledge. That is to say, constructing meaning involves using information and experiences gained previously to interpret new information in light of the old. It also entails recognizing the various reasons that authors structure their texts as they do (e.g., to inform, to persuade, to elicit appreciation for certain literary devices). Finally, comprehension calls for monitoring the de-

mands of a particular reading task, knowing what background knowledge and strategies are relevant to the task, evaluating the inferences one makes while reading, and applying any of a number of fix-up strategies when understanding falters or breaks down completely.

### Unsupported Assertions

Intuitively appealing literacy practices are often linked to improved reading achievement without adequate support in the research literature. Although a lack of empirical evidence for their use does not make such practices wrong, it does call into question the wisdom of making curricular or programmatic decisions on the basis of custom alone or anecdotal evidence at best. A good example of this phenomenon is the widespread acceptance of the idea that encouraging students to read more will translate into improved fluency and higher reading achievement. As the Report of the National Reading Panel has shown, most of the studies that met the panel's stringent criteria for qualifying as scientifically sound research failed to find a positive relation between encouraging students to read and improved reading fluency and achievement.

Another intuitively appealing practice—using technology to improve reading instruction—has only a meager research base to date. Its overall and long-term effectiveness is simply an unknown according to the NRP. Although the panel described several trends suggesting the usefulness of computer technology for reading instruction, too little evidence presently exists to make informed recommendations. Lacking evidence as to whether or not the knowledge students gain from online instruction is superior to that gained from more traditional instruction, reading educators are likely to remain ambivalent about making drastic changes in the way instruction is delivered.

Equally unclear is the degree to which integrated literacy instruction fosters outcomes such as authentic reading tasks, better applicability of learning, deeper and more coherent understanding of subject matter, and greater efficiency in teaching and learning. Thought to be one of education's most elusive constructs, integrated literacy instruction generally involves organizing the curriculum in ways that promote students' use of language and literacy processes to learn school subjects (e.g., science, social studies, math). An extensive review of the research literature on integrated literacy instruction led James Gavelek

and colleagues to remark in the year 2000 on the exceedingly low ratio of data-driven articles to general papers on the topic. Although they remained optimistic about integrative approaches, these researchers questioned whether or not the push toward such integration was a bit premature, or possibly ill-founded.

### Controversies

A controversy exists in the United States about how to teach reading effectively and efficiently to students whose home or first language is not English, the language of mainstream education. The U.S. Census Bureau of 2000, relying on data from the 1990 census, reported that 6.3 million children, ages 5 through 17, speak a language other than English in the home; of these children, 4.1 million speak Spanish. Since 1990 the Hispanic population has increased by 57.9 percent in the United States, a demographic factor that accounts no doubt for people of Hispanic, Latino, and/or Spanish origin receiving the most attention in terms of educational program development. Programs developed primarily to facilitate English language learners' entry into English-speaking schools vary in the degree to which they provide support in the students' home language. Depending on the English language learners' needs and the availability of funding, children may be submersed in classrooms where English is the medium of instruction. This means they will not be offered any first-language literacy support; nor will they receive the three to six years of transitional bilingual education that has been shown to be effective. Although sheltered English language programs are becoming more popular in the United States, they do not offer opportunities for children to become bilingual, biliterate, and bicultural. Two-way bilingual programs, with their emphasis on instruction in both the home language (in many cases in the United States, Spanish) and English, provide such opportunities.

Elizabeth Bernhardt reported in 2000 three possible ways of looking at the relationship between first and second language learning experiences. She noted a transfer relationship where the knowledge and skills of the dominant language transfer to the learning of the second language; an interference relationship where the dominant language impedes the learning of the second language; and a dominance effect where the behaviors of the first language control those of second language literacy. Bernhardt

pointed out that in the case of second language reading, it is unclear as to whether first language skills transfer or interfere with learning to read in a second language. Controversies surrounding the interference model show no sign of abating. In fact, literacy educators, such as Georgia Ernest García, who question the validity of such a model, often cite a well-known longitudinal study of Spanish-speaking children by J. David Ramírez and colleagues, which showed in 1991 that instruction that fosters bilingualism and biliteracy does not place youngsters at an academic disadvantage. In that study, children who were enrolled in a late-exit bilingual program scored higher on standardized tests of English language and reading proficiency than did their monolingual peers.

Another controversy surrounding reading instruction has its roots in what Harvey Graff has labeled in 1988 the "literacy myth." Part of the dominant world view of the Western world for over two centuries, the so-called literacy myth equates the ability to read with personal and individual worth, social order, and economic prosperity. Its tenets reach deep into the American psyche, and its implications for reading instruction regularly place teachers in the public eye. Evidence of the literacy myth's stranglehold on the teaching profession is the fact that educators in the United States often fall under attack by politicians, the media, and the general public for not serving students well enough to ensure that they join the U.S. workforce and compete favorably in the rigors of a world market place.

The problem deepens when the media and other information sources convince the general public that a literacy crisis exists. Word of such a crisis leads parents, teachers, administrators, and policymakers to search for a universally effective way to teach all children to read, and just as predictably, to a proliferation of commercially prepared reading programs. School districts adopt commercially prepared programs in an attempt to solve the perceived problem. For example, programs such as Success for All, Core Knowledge, Accelerated Reader, and Saxon Phonics exist side by side (and in company with many other such programs) in the current educational market. Many of these programs are intended to help teachers concentrate more of their attention on student learning and less on lesson preparation. The developers of these programs also claim they offer continuity and consistency of instruction. Individuals who are critical of commercially prepared reading

programs point to their scripted nature and to the narrow focus of their academic content. Teachers, in particular, sense a loss of autonomy and professionalism when local or state mandates force them to rely on one particular kind of commercial reading program. They know that in the field of literacy instruction the concept of “one-size-fits-all” does not apply to the children they teach. Nor does this type of instruction take into account the multiple literacies children living in the twenty-first century already possess or need to develop.

## LIVING AND LEARNING CENTER RESIDENCE HALLS

---

American higher education can mark the beginning of living and learning centers (LLCs) with the founding of the Harvard house program in 1926, made possible by a gift from William Harkin. The intent of this gift was for Harvard to develop a residential experience similar to those at Oxford and Cambridge universities. Yale University established a similar housing program in 1933, and a few years later Princeton University established what is commonly referred to as the quadrangle plan. All these plans focused on joining the classroom experience with the out-of-class experiences in the residence halls. The goal was to bring faculty and students into closer contact and to promote an environment that allowed students increased opportunities to discuss classroom subjects and other academic topics with peers in their residence halls.

Based on the English residential college model, the LLC environment is designed to foster a closer relationship between students' classroom experiences and their experiences outside the classroom. LLCs offer one of the best environments for partnerships between faculty and student affairs professionals to advance student learning.

Students usually gain residence in an LLC following an application and selection process. Academic courses for credit and enriched educational and cultural programs for student residents are part of the LLC experience. LLCs are usually compared with conventional residence halls, which commonly offer educational programs, organize recreational

activities, and have some form of hall counsel or student government organization. The primary differences between conventional residence halls and LLCs are the programs and class experiences that are offered and the selection and application process used. Students who live in LLCs usually take one or more of their courses in the residence hall and/or take one or more courses with the other residents of their living unit. In addition, the administrative organization of LLCs differs from conventional residence halls in that faculty members have some administrative responsibilities in the LLC and some faculty often live in the LLC. Faculty normally do not have administrative responsibilities or live in conventional residence halls.

At the beginning of the twenty-first century, hundreds of universities have some version of the living and learning center. Some are based around a particular academic college such as the college of engineering, but most are interdisciplinary.

#### Organization and Administration

There are many versions of LLCs. They vary with regard to their history, academic programs, and degree of involvement with the faculty. The most successful of these programs place the students' living environment in the closest proximity to the location of faculty offices. Residence halls specifically designed as LLCs usually have classrooms, faculty offices, and one or more faculty apartments built into the residence hall. LLCs are most often organized to house both male and female students in the same building.

LLCs bring together the expertise of faculty and student affairs professionals to build a residence hall community focused on fostering students' personal and intellectual growth. Management of the LLC facilities, room assignments, crisis intervention, hall government, and the enforcement of institutional policies are usually responsibilities of the student affairs professionals. Classroom instruction, selection of LLC participants, and criteria for common courses or similar academic experiences are usually the responsibility of the LLC faculty. Educational programming, the selection of resident assistants, and issues concerning individual students or groups of students commonly are shared responsibilities.

Because of the way residence halls are built and funded, LLCs are usually the financial responsibility of the director of housing and residence life and the vice president for student affairs. Staffing in LLCs is

similar to a conventional residence hall with undergraduate resident assistants (RAs) living on each floor and a student affairs professional living in the building. The faculty head of the residence hall might be called something like head of house, headmaster, or director. The closer the integration between the student affairs professional and the faculty of the LLC, the more likely the program will be successful.

### Research Findings in Living and Learning Centers

Educational advantages supported by the LLC environment are derived through a combination of factors. Among these are increased opportunities for informal interaction with faculty, an enriched academic experience with a greater intellectual atmosphere, a greater sense of community among students, and support for a wider range of creative endeavors. The benefits of LLCs have been recognized by the National Institutes of Education, the Wingspread Group on Higher Education, and the National Association of State Universities and Land Grant Colleges. Reports by these institutions cite the LLC as a model that details how to integrate the academic experience of the classroom with student life outside the classroom. Research on colleges that have been successful in broadening the undergraduate experience point to the benefits of LLCs, giving as examples programs that integrate and involve students in the campus community.

Research on residence halls shows that students living in conventional residence halls have an advantage over students who are living at home with parents, at least in their first year of college. These advantages include greater psychosocial development, higher retention and graduation rates, greater satisfaction, greater educational aspiration, and similar positive outcomes associated with student learning. The question addressed by most of the research on LLCs concerns the extent to which living in an LLC may further enhance the college experience.

On most educational criteria, research shows that living in an LLC is more beneficial to students than living in a conventional residence hall. Students in LLCs, when controlling for past academic performance, perform better academically, perceive the intellectual atmosphere of their living environment to be more academic, have more faculty interaction, and report a better social climate. Some studies have

also shown that students living in LLCs have lower attrition rates and higher graduation rates.

### Problems Associated with Creating and Sustaining Living and Learning Centers

Despite the benefits of LLCs, most attempts at creating and sustaining them fail. LLCs require a faculty commitment to spend more out-of-class time with students and to focus an increased amount of their creative energy on designing programs and activities with students. Unfortunately, the reward system for faculty, including tenure and promotion, does not always recognize the value of these contributions. Unless the academic department and the LLC are closely joined, faculty can be drawn between the departmental culture of scholarship and the LLC culture of student engagement. The most successful LLC programs are tied closely with an interdisciplinary department. This relationship allows for a wider range of faculty expertise and for the faculty reward system to more generously recognize the value of out-of-class commitments to student learning.

LLCs usually demand a greater financial commitment for educational programming and complicate the campus room assignments procedures because of the selection process used to admit LLC students. Both factors can be sources of concern for housing and residence-life professionals who must consider every student living in residence halls when allocating resources and meeting the demand for on-campus student housing. Even with these concerns, institutions that have invested in LLC residence halls find that the benefits to student learning, graduation, retention, and the value of an engaged and committed student body, outweigh the difficulties that must be overcome.

SCHOOL SYSTEMS; INTERGOVERNMENTAL RELATIONS IN EDUCATION; IMPACT AID, PUBLIC LAWS 815 AND 874; SCHOOL BOARD RELATIONS; SCHOOL BOARDS; SCHOOL REFORM.

## LOOPING

*Looping* is a practice in which a teacher stays with the same class for more than one year; it is a multiyear placement for both the students and the teacher. For example, a teacher begins with a group of first-grade students and rather than sending those students on to a new teacher continues with them through second grade. Looping can occur for two or more consecutive years. In this example, the teacher could choose to remain with those students and move up to third grade. Looping can be used in conjunction with, or as a transition to, multiage programs but does not necessarily include students of a wider age range.

### How Widespread Is Its Use?

The level of implementation varies widely. In some school districts looping options are offered at every grade level. In other instances, an individual teacher or pairs of educators initiate looping. Looping occurs most frequently in elementary schools and occasionally in middle schools. It is used in public and private school settings. Looping has gained popularity, but it is still considered innovative.

### Rationale

The rising interest in looping has been in direct response to the diverse needs of students. Looping provides stability for the growing number of students with less stable home environments. Looping classes develop a family-like environment, providing teachers with the opportunity to build strong, meaningful relationships with students. Students also have the additional time to develop positive relationships with classmates.

More instructional time is another benefit of this teaching design. Teachers and students "hit the ground running" at the beginning of the school year instead of starting from scratch each year. Teachers begin instruction immediately, rather than spending time assessing student achievement or developing classroom procedures. Students pick up where they

left off instructionally and socially and are able to get into the swing of school quickly. Instructional time is gained at the end of the school year as well. Instead of packing up and checking out, looping teachers are able to continue instruction through the end of the year and end the year on a high note. The additional four to six weeks of instructional time allows teachers to gain an understanding of students' academic and social strengths and to plan instruction accordingly.

Another benefit is that teachers are able to give students projects to complete over the summer, in between the looping years, which keep students involved in learning. The momentum of learning continues and more continuity is provided for the students. These extended learning opportunities help students to realize that learning can occur outside of the classroom.

Increased parental involvement is another advantage of looping. Parents are able to gain a better understanding of their child's educational development and needs. Looping provides a means by which stronger parent-teacher relationships may be built. This bridge between home and school can help create a more family-like atmosphere in the classroom and beyond.

Looping requires minimal additional funding and is easy to implement. Additional curriculum resources and staff development are useful in implementing a looping classroom; however, most teachers will have the necessary skills to move up a grade with their students. Looping does not require additional classroom space and teachers can loop without disrupting other organizational aspects of the school.

By working with two or more sequential grades and the related content, teachers develop an overall view of the scope and sequence of the curriculum and the school program. This in-depth understanding allows them to maximize instructional time and provide remediation or enrichment based on student needs.

Although most teachers and students have positive experiences with looping, it is not appropriate for all schools, teachers, or students. Difficulties can and do occur. Integrating new students into an established looped class can be a challenge. Class dynamics and peer relationships can also go awry; there are times when too much togetherness wears on the students. Occasionally a personality conflict

between a student and teacher may arise. These conflicts are most often resolved. However, if resolution seems unreachable, then the student is transferred to a different class. Another concern with looping is that students and teachers become emotionally attached and separations are difficult when the looping cycle ends.

### **Evidence Supporting Its Use**

*The Looping Handbook* by Jim Grant, Bob Johnson, and Irv Richardson provides evidence supporting the use of looping. Beyond the benefits reported by teachers and parents, there is evidence that looping results in increased student attendance, decreased retention rates, a decline in discipline problems and suspensions, and increased staff attendance.

The Attleboro, Massachusetts, School District has provided looping assignments to its entire first-through eighth-grade students and all of its 400-some teachers. In addition there are cited examples of looping around the country, such as Ashby Lee Elementary School in Virginia, Liberty Center Elementary School in Ohio, Lac du Flambeau in rural Wisconsin, and schools in Chicago, Illinois. *The Looping Handbook* provides a list of several schools that are open to visitors. In addition, there exist numerous educational studies and articles on looping.

The Waldorf school system, with private schools located around the country, follows the tenets of its founder, Rudolf Steiner. One of these practiced beliefs is looping. A Waldorf teacher in the United States stays with a group of students from first through eighth grade.

It has been suggested that looping has occurred in thousands of schools across the United States. However, many of the looping classes have not been documented. For example, a teacher in California has looped with his students from second grade through sixth grade, but this case has not been tied or documented in educational research.

In a report from the National Middle School Association (NMSA), Paul S. George and John H. Lounsbury stated that looping is a major way of achieving long-lasting teacher-student relationships. According to the report, "increasing numbers of middle school educators believe that the education of young adolescents can be enhanced when teachers and students are members of classroom and small team groups characterized by long-lasting relationships" (p. 2).

The authors also reported that several middle schools around the country have implemented looping with success in an attempt to make a big school small. For many students the transition from a small elementary school environment with one teacher a year to a large middle school with several teachers a day can be overwhelming. Looping at the middle school level provides a nonthreatening environment for students. This allows the students to succeed academically and socially.

## LOWENFELD, VIKTOR (1903–1960)

Viktor Lowenfeld, professor of art education at the Pennsylvania State University, helped to define and develop the field of art education in the United States. His life and career have been a continuing topic of study in the field.

### Early Career and Influences

Lowenfeld was born in Linz, Austria, of Jewish parents. He taught art in the elementary schools in Vienna while attending the Vienna Academy of Fine Arts, which he found “very dry and academic.” Lowenfeld then transferred to the Vienna Kunstgewerbeschule, which he likened to a “Vienna

Bauhaus.” He studied sculpture under Edward Steinberg, who required that his students blindfold themselves when working with clay. Lowenfeld visited the Institute for the Blind to validate or disprove Steinberg’s approach. He also studied at the University in Vienna in art history and psychology, graduating in 1928. While still engaged in his studies, he became a member of the staff at the Institute for the Blind.

Sigmund Freud read an article about Lowenfeld’s work with the blind and visited him at the institute. As a result, Lowenfeld became more seriously involved in research as a scientific venture. His ideas on the therapeutic uses of creative activity in the arts resulted in several books. The first was titled *Die Entstehung der Plastik* (The genesis of sculpturing, 1932), which was based on his doctoral dissertation. The second was titled *Plastische Arbeiten Blinder* (Sculptures of the blind, 1934). A third, though initially written in German, became his first English publication, *The Nature of Creative Activity* (1939).

### Lowenfeld’s American Career

With the German invasion of Austria in 1938, Lowenfeld and his family fled to England, later settling in the United States, where he met Victor D’Amico, who was director of education at the Museum of Modern Art in New York City. D’Amico took credit for introducing Lowenfeld into the circles of American art education. During World War II Lowenfeld taught psychology at the Hampton Institute in Virginia. Having experienced racial prejudice at the hands of the Nazis, he was acutely aware of the racism experienced by his African-American students at Hampton. Though his field was psychology, Lowenfeld was directly responsible for establishing the art department at Hampton. A number of his Hampton students became prominent artists, including John Biggers, Elizabeth Catlett, and Samela Lewis. In 1945 Lowenfeld was invited to teach summer courses at Pennsylvania State College (now the Pennsylvania State University) and, in the following year, was invited to become chairman of art education, a position he held until his death in 1960. Several of his Hampton students followed him to Pennsylvania State College to continue their studies.

In 1947 *Creative and Mental Growth* was published and became the single most influential textbook in art education during the latter half of the twentieth century, having gone through seven editions. This text was widely adopted in courses for

prospective elementary school teachers throughout the United States, a time when teacher education programs were undergoing rapid expansion in response to the shortage of teachers that followed World War II. This book describes the characteristics of child art at each stage of development and prescribes appropriate types of art media and activities for each age. Its strong psychological orientation provides a scientific basis for creative expression and the practices that cultivate it.

Lowenfeld's views of child art were grounded in constructs drawn from two sources. One was the psychoanalytic school of psychology in which evidence of aesthetic, social, physical, intellectual, and emotional growth is reflected in the art of children. The second was the concept of stages of growth in art, which originated in German and Austrian sources. The stages consisted of (1) scribble—uncontrolled, controlled, naming of scribble: two to four years; (2) preschematic: four to six years; (3) schematic: seven to nine years; (4) dawning realism/gang age: nine to eleven years; (5) pseudorealistic/age of reasoning: eleven to thirteen years; and (6) period of decision/crisis of adolescence: fourteen years and older.

Lowenfeld did not claim to originate these stages but adapted them from earlier sources. He also identified two expressive types of individuals that arise with the onset of adolescence. The first is the *haptic type*, which is primarily concerned with bodily sensations and subjective experiences in which individuals are emotionally involved. By contrast, the *visual type* usually approaches the world from the standpoint of appearances. Such students feel more like spectators than participants. Lowenfeld suggested that each creative type needed a different instructional approach.

He saw the free expression of children in artistic media as necessary for the healthy growth of the individual. Emotional or mental disturbance results when children are thwarted, either by a loss of self-confidence or by the imposition of adult concepts of so-called good art.

Concern for mental health had social consequences as well. In the second edition of *Creative and Mental Growth* (1952) he injected a personal note:

“Having experienced the devastating effect of rigid dogmatism and disrespect for individual differences, I know that force does

not solve problems and that the basis for human relationships is usually created in the homes and kindergartens. I feel strongly that without the imposed discipline common in German family lives and schools the acceptance of totalitarianism would have been impossible.” (p. ix)

Lowenfeld never regarded child art as an end in itself. He was critical of his former teacher Franz Cizek, who emphasized the aesthetic aspects of child art as the sole purpose for art education. This “is much against our philosophy, and I believe also against the needs of our time.” The goal of education “is not the art itself, or the aesthetic product, or the aesthetic experience, but rather the child who grows up more creatively and sensitively and applies his experience in the arts to whatever life situations may be applicable” (Michael, p. xix).

### Influence on Art Education

A number of students were drawn to Lowenfeld both through his text *Creative and Mental Growth*, and through extensive lectures and presentations given at state and national conferences throughout the late 1940s and 1950s. Many came to the Pennsylvania State University to study, and by 1960 its graduate program had become the largest one in art education in the United States. Lowenfeld wrote about the similarity of creativity in the arts with that of the sciences, suggesting that general creativeness might transfer from the arts. A number of doctoral dissertations were inspired by these views on the psychological importance of creativity cultivated in the arts for creative abilities in general.

Although revered by numerous students, Lowenfeld was not without his critics. D'Amico felt that Lowenfeld had over-psychologized art education and that too many future teachers were pursuing psychological research rather than deepening their powers of creative expression. In addition, with the onset of the curriculum reform movement that was spurred by Soviet space achievements, such as the launch of *Sputnik* in 1957, the importance of discipline-oriented forms of study began to challenge Lowenfeld's ideas about creativity as the central purpose of art education.

## **MACDONALD, JAMES (1925–1983)**

The work in curriculum theory of James Macdonald (1925–1983), Distinguished Professor of Education at the University of North Carolina at Greensboro, helped move the field beyond the traditional and scientific orientations of the 1950s and 1960s and toward an approach centered on human, ethical, and even spiritual considerations. Recognizing that schools were often dehumanizing and impersonal, Macdonald was a consistent critic of educational theory and practice that neglected the important work of helping students achieve their fullest potential as human beings in a democratic society.

Macdonald grew up in a small town in southern Wisconsin. First certified as a secondary school teacher in social studies, he briefly taught elementary school before enrolling in the doctoral program at the University of Wisconsin–Madison. There he studied under Virgil Herrick, a prominent professor of education whose analytic and conceptual work in curriculum theory would serve as a basis for Macdonald’s own thought. Upon completing his doctoral degree, Macdonald taught at the University of Texas–Austin (1956–1957) and New York University (1957–1959) before returning to Wisconsin in 1959 as director of School Experimentation and Research at the University of Wisconsin–Milwaukee. In 1963 he moved to the University of Wisconsin–Madison as a professor in the Department of Curriculum and Instruction and the Department of Educational Policy. He returned to University of Wisconsin–Milwaukee in 1966 as a professor of Curriculum and Social and Philosophical Foundations of Education. In 1972 he accepted a position as Distinguished Professor of Education at the University

of North Carolina at Greensboro, where he remained until his death in 1983.

Throughout the course of its development, Macdonald’s work reflected a systematic attempt to formulate a comprehensive curriculum theory that balanced the institutional, technocratic realities of schooling and educational research with human, ethical, and social ideals. He identified four stages through which his own thinking had evolved during the span of his career. The first stage was based on scientific theory and method and is reflected in Macdonald’s work from the late 1950s and early 1960s. Taking his cue from Herrick, Macdonald’s focus during this period was on building and explaining curriculum theory through scientific and empirical means.

Macdonald characterized the second stage of his thought as personalized humanism. During this time, Macdonald’s work focused on understanding how schooling helped and hindered the development of students’ self-concept. In his 1964 article, “An Image of Man: The Learner Himself,” Macdonald extended humanist concepts popularized by psychologists like Carl Rogers and Abraham Maslow to processes of schooling. His concern was with human development, or becoming, and how schools and teachers could best facilitate the self-actualizing processes of their students.

By the late 1960s and early 1970s, Macdonald’s thought had moved into a third stage, social humanism, which placed his earlier humanist concerns within a social and political context. His work of this period undertook an analytic critique of the social, bureaucratic, and institutional pressures on schooling and curriculum. His 1971 essay “The School as a Double Agent” took note of the conflict between

the democratic ideals of schooling and the repressive realities of its organizational, procedural, and institutional demands. In the 1978 essay "Curriculum, Consciousness, and Social Change," Macdonald reiterated his belief that the curriculum work done in schools should liberate the spiritual, intellectual, and physical potentiality of students in the interest of realizing the ideals inherent to democratic society.

Macdonald called the fourth stage in the development of his thought transcendentalism. In this stage, Macdonald extended his personalized and social humanist concerns into the area of culture. He argued for the need to transcend normal patterns of cultural awareness in order to promote the fullest realization of a student's sense of what it is to be human. In his 1974 article "A Transcendental Developmental Ideology of Education," Macdonald critiqued four basic conceptual models, or ideologies, of education and found each inadequate with respect to the justification of its underlying values. As an alternative to these four models, he proposed a transcendental developmental ideology based in part on the notion of aesthetic rationality, a form of knowledge that is both rational and intuitive.

Although Macdonald never published a book-length manuscript, he was a prolific essayist whose work appeared in a variety of scholarly and professional journals, edited books, and monographs. He was a regular presenter at professional conferences and gatherings. His work is widely associated with the curriculum field's reconceptualization, a movement in 1970s that sought to broaden the means and aims of curriculum theorizing by borrowing insights and methods from the humanities.

## MAGNET SCHOOLS

Magnet schools are public K–12 schools, or programs within schools, developed around a particular theme to promote racial and ethnic diversity. Magnet schools are based on the premise that all students do not learn in the same ways, and that if educators find a unifying theme or a different organizational structure for students with similar interests, those students will be motivated to learn more in all areas. In addition, magnet schools provide public choice within school districts.

If a magnet school attracts students and teachers, its chance of succeeding is greatly improved because those in attendance want to be there—they will have chosen that school. When a parent chooses a school for his or her child, that school is more likely to succeed for that child than would one to which that child was randomly assigned. These tenets underlie the development of magnet schools in America.

### History

In the United States during the 1960s some options to traditional public schools sprang up as a protest against racially segregated schools. These schools emphasized the basic subjects of reading, writing, and arithmetic, but they also included the study of the history of African Americans and the civil rights movement, and they were concerned with how schools could be tied to community needs. Some of these schools, called *street academies*, led to more permanent structures. Harlem Prep, for example, first funded by foundations, businesses, and industry, became one of the public schools of New York City.

The history of magnet schools is tied to the 1960s protest over school desegregation, and to the

educational reform model of public choice as a way to address educational inequality. Until the early 1970s federal district courts had directed school systems to implement desegregation policies. In Detroit the courts did not impose a multiple-district solution to segregation, but did approve special enrichment programs intended to help overcome the effects of past discrimination. In the wake of this decision, nearly every court order mandating that schools desegregate also included a voluntary component, which became known as magnet schools. The courts learned that by using a carrot instead of a stick, more desegregation would occur, and quality of education would improve at the same time.

In the late 1960s school districts across America were being torn apart by resistance to forced desegregation of the schools. Many parents moved to a suburban district to keep from having their children bused to a school away from the neighborhood. Others chose private education for their children. School administrators and boards of education began to try to find a voluntary way to reduce racial isolation.

The highly publicized violence and protests, as well as the *white flight* from public schools, made public school choice a school segregation remedy. As Lauri Steele and Roger Levine noted, by making available a curricular alternative, magnet schools were intended to provide incentives to parents to remain in the public school system while sending their children to integrated schools.

The first public school designed to reduce racial isolation by offering a school choice to parents was McCarver Elementary School in Tacoma, Washington, which opened in 1968. In 1969 Trotter Elementary School, in Boston, Massachusetts, opened for the same reasons. Both of these first attempts offered a new organizational pattern. They guaranteed continuous-progress education, in which students would progress at their own rates. Neither of these schools was called a magnet; they were referred to as alternative schools.

In 1970, with the assistance of \$6 million from the federal government, Minneapolis, Minnesota, mounted an alternative experiment in the southeast section of the city. This district opened four elementary schools and one high school with different organizational designs. Of the four elementary schools, the least structured was referred to as *free*, in which the students directed their own education. The sec-

ond type was called *open*, and had an informal classroom design. The third was a continuous-progress school, and the fourth used a traditional approach, which Minneapolis called *contemporary*.

Following the pattern established in Minneapolis, Haaren High School in New York City, with the assistance of the Urban Coalition, broke into smaller units with more personalized instruction. Berkeley, California, also following the pattern established in the Minneapolis elementary schools, embarked on a full-scale alternative schools program, featuring basic-skills centers, environmentally-oriented programs, independent contracting for curriculum delivery with businesses, and more. The word *magnet* was still not being used, although these programs looked much like schools that are called magnets in the early twenty-first century.

Dallas, Texas, opened the first *super* high school in 1971. Designed around the concept of career strands, Skyline High School attracted students of all kinds—rich, poor, Hispanic, African-American, Asian, white—from all over the city. It even offered adult classes in the evenings. In fact the school rarely closed its doors. Some students came for a full-day program, others came part-time, and still others came after school.

### Magnet Schools

It was about this time that school administrators in Houston, Texas, in describing the effect of its Performing and Visual Arts School, said that it worked like a “magnet” in attracting students. The word appeared to catch on. By 1975 the term was being used to describe various types of fiscal assistance contemplated by the federal government.

In 1973 Cincinnati opened a wide range of school options, among them the first Montessori school in the public sector and the first foreign language school, both beginning in the primary grades. By 1980 most major cities had systems of magnets, but it was the federal courts, in ruling against school segregation, that caused the greatest surge in magnet education.

### Magnet Schools in the Early Twenty-First Century

Magnet schools and magnet programs continue to be used to reduce racial isolation, but they are increasingly considered superior options within the public sector for all students, even in districts of pri-

marily one race. School districts offer anywhere from one to more than one hundred *themes* to attract students, including fine and performing arts, communications, humanities, wellness and health, education, international studies, language arts, technology, foreign languages, and many others.

North Dade Center for Modern Languages in Miami, Florida, specializes in modern languages and multicultural education for elementary students. The school's "magnet" is instruction in Spanish and French. Students at North Dade have excelled in all areas of the Stanford Achievement Test, scoring well above the national median. The Carver Center for the Arts and Technology in Baltimore, Maryland, is a public school with students in the ninth through twelfth grades that attracts students from a 600-square-mile area. The students at Carver take ninety-minute block schedules that enable them to earn eleven additional credits beyond the Maryland state graduation requirements. Mabel Hoggard Magnet School is a K–5th grade school in Las Vegas, Nevada, that emphasizes math and science across the curriculum. The school has a partnership for student experience with the University of Nevada, Las Vegas, Engineering Department.

There are more than 4,000 magnet schools in the United States, and they are springing up in other countries, such as Canada and the Netherlands. The Dayton Accord, an agreement made to resolve the conflict in the former Yugoslavia, included a plan to develop a magnet school in Bosnia-Herzegovina. This school would promote cultural and ethnic diversity. Magnet schools in the United States come together to share their successes and struggles in a national non-profit membership organization: Magnet Schools of America (MSA).

### **Magnet Schools of America**

MSA is a national organization representing more than 4,000 magnet schools. It was founded to promote and advance the cause of magnet-school education. According to former executive director Dr. Donald Waldrip, MSA had its beginning in 1977, in the Dallas Independent School District. The first MSA conference featured Dr. Mario Fantini, dean of the University of Massachusetts School of Education and an advocate of public school choice; Dr. John B. Davis Jr., former Superintendent of the Minneapolis Public Schools, which was the first school system to adopt magnet schools; U.S. Senator John Glenn, who sponsored the first funding bill for magnet

schools; and the Honorable George Edwards, Chief Judge of the Sixth Circuit Court of Appeals and a voice for equity. Two more annual conferences were held—in 1978 in New Orleans and in 1979 in San Diego. Although Dr. Waldrip believed in 1979 that "everyone who was going to organize magnet schools had done so," after a seven-year hiatus the fourth conference was held in Milwaukee, and has been an annual event ever since. The conference offers staff development sessions, informational workshops, and opportunities to showcase magnet schools.

In 1991 Magnet Schools of America became a more formalized organization. At the tenth conference in Columbus, Ohio, a national board was elected, with Dr. Judith S. Stein serving as the first president. In 1994 MSA became a not-for-profit, 501(c)(3) corporation. For federally funded magnet schools (i.e., Magnet School Assistance Program grant recipients), MSA provides special technical assistance workshops on the development of new magnet schools, as well as programs for the improvement of existing schools.

### **Mission of Magnet Schools of America**

MSA's mission is to (1) promote the goals of desegregation, equity, and excellence through the expansion and improvement of magnet schools; (2) encourage the passage of legislation at both the state and national levels that will promote the development and improvement of magnet schools, (3) explore and establish linkages with other professional groups with similar interests, and (4) promote networking among magnet schools. MSA seeks to encourage America's businesses to become actively involved in magnet schools by supporting them both conceptually and financially. It also provides information for parents and community members on the benefits of magnet schools as public schools of choice, and acts as a national clearinghouse for information dissemination on magnet schools.

### **The Federal Magnet Schools Assistance Program**

The U.S. Department of Education has a competitive funding program for magnet schools, the Magnet School Assistance Program, which works in three-year cycles. Schools complete extensive applications based on a Request for Proposals from the federal government. Grant proposals can be quite extensive, sometimes running to several volumes. They include data on the community and school system, and re-

quire either a court-ordered or voluntary desegregation plan. The grant proposals are read by educators representing the various parts of the United States and the U.S. Department of Education and have a lengthy approval and encumbering process. The average grant is \$2 million, but grants can range upwards to \$4 million.

According to magnet school researchers Steele and Marion Eaton, the Magnet School Assistance Program was begun in 1984 to provide federal support for magnet schools that had desegregation plans, whether court-ordered or voluntary. The program provides funds to support the elimination, reduction, or prevention of minority isolation in elementary and secondary schools. Steel and Eaton note that federal support for magnet programs over the decade of the 1990s was substantial.

### Research and Popular Press

The National Educational Longitudinal Survey (NELS) is a popular study that surveyed all types of schools in 1988. After examining the NELS study, Adam Gamoran stated that he “found that magnet schools are more effective than regular schools at raising the proficiency of students in science, reading, and social studies.” Furthermore, “magnet schools are more likely to serve disadvantaged students than comprehensive schools, yet they rate at least as well in academic climate, social attachment, and course taking” (Brooks, Stein, Waldrup, and Hale, p. 37).

Texas and Florida have the most magnet schools. Miami, Florida, and Orlando, Florida, were each labeled in 2001 as one of the “10 best cities for families” by *Child* magazine, based upon the magnet schools in these cities. Miami-Dade County and Palm Beach County, Florida, both have extensive magnet school programs. According to *Working Mother* magazine the “only downside [to magnet schools] seems to be that there aren’t enough of them to fill the demand, and not enough space in the ones that exist” (Hanson-Harding, pp. 67–68). Magnet schools can be located by contacting the local education agency or Magnet Schools of America.

## MANAGED CARE AND CHILDREN

Since the early 1980s the health care system in the United States has been radically transformed from

one dominated by fee-for-service arrangements to one dominated by managed care. Between 1980 and 2000 the number of Americans enrolled in some form of managed care rose fourteenfold. By that year, an estimated 140 million people were enrolled in health maintenance organizations (HMOs), one form of managed care. Because many children are beneficiaries of employment-based insurance, they are increasingly enrolled in managed-care plans, along with their parents. It is estimated that as of 1996, half of all insured children were enrolled in managed-care plans. Children are also being enrolled in managed-care plans through the nationwide conversion of state Medicaid programs from fee-for-service to managed care, and through the adoption of the State Child Health Insurance Program (SCHIP), which was enacted by Congress in 1997 to extend health insurance to low-income children who are ineligible for Medicaid, but whose family incomes are too low to afford private insurance. By 2000 most states had implemented managed-care programs for Medicaid and SCHIP beneficiaries.

### What Is Managed Care?

The term *managed care* refers to a variety of health care financing and delivery arrangements. The single unifying characteristic of these various approaches is that those enrolled are either encouraged or required to obtain care through a network of participating providers—providers that are selected by the managed-care organization and agree to abide by the rules of that organization. This is in contrast to fee-for-service arrangements, in which patients typically may seek care from any licensed health care professional or organization, and providers may perform services based on their individual judgments about what care is appropriate or needed. Under fee-for-service, however, an insurer may decide after the fact not to reimburse the health care provider or the patient for certain services received.

The primary purposes of limiting the range of providers available to enrolled patients under managed care are twofold: to control the patient's access to services, and to control the behavior of the providers. A limited network of providers not only restricts utilization to those providers in the plan, but also permits the plan to control participating providers with respect to patient utilization. By controlling access and utilization, plans can better control costs.

The ways in which managed-care plans control access and utilization varies among the different managed-care models. Plans vary in terms of the degree of risk that is placed on the physicians (as opposed to the plan or the payer); the relationship among the physicians within the network; and the exclusivity of the relationship between the plan (or an intermediary) and the medical group.

HMO plans generally have two defining characteristics: providers are at direct or indirect financial risk for providing services, and enrollees usually have no coverage for out-of-network use. The types of HMO plans are distinguished from each other by the type of physicians organization that delivers the services, and by the exclusivity of the relationship between the plan or intermediary and large medical groups.

Preferred provider organization (PPO) plans have three defining characteristics. First, they do not capitate or put their network physician members at risk. (Capitation is defined as a single payment to a provider per member per month of service, regardless of patient encounters.) PPOs generally pay physicians on a fee-for-service basis, often at a discount from usual, customary, and reasonable charges. Second, enrollees in a PPO plan usually receive services from a network of solo or small-group physicians and a network of hospitals that have nonexclusive relationships with the PPO (though some PPO enrollees receive services from large group practices). Third, PPO enrollees receive some benefit coverage if they obtain health care services from a non-network provider.

Point-of-service (POS) plans may be thought of as HMOs with a PPO *wraparound*. They are defined by one typical characteristic. When services are needed (the *point-of-service*), enrollees can choose to obtain services out-of-network and still obtain some coverage for that service. POS-plan enrollees pay higher premiums than do those enrolled in traditional HMOs.

### Trends in Managed Care among Children

Since 1973, when Congress enacted the Health Maintenance Organization Act to support the development of HMOs, managed care has rapidly taken hold. By 1995 nearly three-quarters of Americans who received their health insurance through an employer were enrolled in a managed-care plan, up from 51 percent just two years earlier. Total mem-

bership in insurer-sponsored managed care at the end of the 1990's approached \$132 million. This widespread move toward managed care is largely a reflection of payers' interest in controlling their costs. Employers and government sponsors face increasing pressure to contain costs, including those related to health insurance for their employees. In some employer plans, as well as most Medicaid and SCHIP programs, consumers are no longer given the choice between managed care and open fee-for-service but are required to accept managed-care enrollment. Although both health insurance premium increases and Medicaid spending growth slowed in the late 1990s and into the twenty-first century, forecasters have predicted that managed care will continue to assume a greater proportion of the market.

The largest increases in managed-care enrollment have occurred in the private market. In 1996, 43 percent of insured persons were enrolled in HMOs. Managed care has also taken over government insurance programs such as Medicaid. Since the early 1980s, when federal restrictions on managed-care enrollment were significantly relaxed, the number of Medicaid beneficiaries enrolled in managed care has risen. As a result, national enrollment rates in managed care grew fivefold during the 1990s. In California, where managed-care penetration is the greatest, half of all children with Medicaid coverage were enrolled in managed-care organizations in 1999. All states with SCHIP programs enroll participants in managed-care plans. Since Medicaid managed care involves mostly children, and SCHIP is exclusively for children, the adoption of managed care by these programs is significant. Indeed, managed care is becoming the norm for children. Nearly half of all insured children were enrolled in managed-care plans in 1996.

### **Is Managed Care Good or Bad for Children?**

Most observers agree that the transition from fee-for-service arrangements to managed care presents both challenges and opportunities in the provision of services to children. Managed care has the potential to affect access to health care, the quality of care received, and health care costs in countless ways. Advocates of managed care contend that it can result in improvements over fee-for-service through improved coordination and convenience of health services, an emphasis on prevention, and establishing a medical home or continuity in health care. Opponents of managed care argue the opposite, contend-

ing that it has the potential to create barriers for children through financial disincentives to provide quality care, limitations on providers and services, and other system-related obstacles to care, particularly specialty care. Which of these perspectives is correct remains an unresolved question.

### **Access, Quality, and Costs**

**Access.** A major advantage of managed care over traditional fee-for-service delivery systems is that managed-care plans normally have more comprehensive information about their enrolled populations and can more effectively track service-use patterns. Managed-care plans can use data systems to develop strategies aimed at improving access to care and the quality of services received by children. A potential disadvantage is the strong incentive to control costs, which may limit needed medical services, particularly for vulnerable populations.

Despite these theoretical advantages and disadvantages, neither has been definitively proven. Studies assessing the impact of managed care on access to care among Medicaid-enrolled children in the early 1980s found that the use of routine preventive services was the same or slightly increased under Medicaid managed care compared to fee-for-service. However, compliance was below the recommended standards for check-ups set by the American Academy of Pediatrics and the federal Early Periodic Screening, Diagnostic, and Treatment (EPSDT) program, which is a component of Medicaid specifying benefits that must be made available to enrolled children. Several more recent studies confirm this general finding. Researchers who examined eighteen access indicators found that only three of them showed statistically significant differences between children enrolled in managed care and children enrolled in traditional health plans. Children enrolled in managed care were more likely to receive physician services, more likely to have access to office-based care during evening or weekend hours, and more likely to report being very satisfied with the overall quality of care. However, the analysis also revealed some problem areas, including challenges getting appointments and contacting medical providers by telephone. Lack of strong evidence of differences in access to care has been found in other recent studies, as well.

One exception to this general finding relates to access to specialty medical care. There is evidence that children in managed-care plans face greater dif-

facilities than others in obtaining pediatric specialty services. This is especially problematic for children with special health care needs (such as disabilities and chronic health problems) who are enrolled in plans that are more restrictive in terms of parents' ability to self-refer their children for specialty care.

Among general populations of HMO enrollees, children get more primary and preventive care, but they also get less specialist care and experience more provider access and organizational barriers to care. HMO enrollees are more likely to report a regular source of care than those enrolled in other types of insurance, but they are more likely to report access problems related to the organization of care delivery.

**Quality.** Little is known about the quality of care children receive in managed-care settings. Detecting differences related to quality is impeded by imprecise definitions of quality, as well as the lack of uniform methods of measuring it. While measuring quality is problematic regardless of the population of interest or the type of plans within which the population is enrolled, the lack of consistent and reliable methods of assessing quality in managed-care settings (especially given its widespread and rapid adoption), is of concern to many.

Nonetheless, some studies have attempted to assess the quality of managed care for children. By and large, these studies rely on parents' reported satisfaction with care and other services within the plan. (To date, no studies have been published that examined clinical differences or other direct measures of health status.) In general, the results are mixed. One major study found that over 95 percent of families generally reported high levels of satisfaction with their children's care regardless of the type of plan in which they are enrolled. This study found no strong evidence of significant differences in satisfaction with care or quality of care between children enrolled in managed care and fee-for-service health plans. This is in contrast to another study, which found evidence that families and providers are sometimes less satisfied under managed care.

Such mixed findings are also found when examining the experience of children in Medicaid managed care. One major study found no significant differences in parents' ratings of the health care experience comparing those of children in Medicaid managed care versus fee-for-service, while another found that Medicaid managed-care enrollees were slightly more satisfied than their counterparts in fee-

for-service plans. Interestingly, it appears that racial and ethnic minorities are generally less satisfied than their white counterparts. One study that found such differences concluded that language barriers largely account for the racial and ethnic disparities in satisfaction with care in Medicaid managed-care plans. These findings suggest the need for further research with diverse populations, such as African Americans, where language is not an issue in receiving care.

More research has been conducted on the impact of managed-care enrollment among general populations (rather than by age) and the majority of this work has focused on patient satisfaction. In general, these studies report that satisfaction with overall care was lower among HMOs, which also received fewer excellent ratings from enrollees regarding their visits with physicians. In addition, HMO enrollees were less confident that their physicians would refer them to needed specialty care than were consumers in non-HMO plans. All together, HMOs scored lower on eight out of nine satisfaction measures, with differences ranging from 3 to 7 percentage points, and enrollees reporting less satisfaction, lower levels of care, and less trust in their physicians.

**Costs.** Managed-care plans are nearly always designed to achieve some cost-savings. Despite this, few studies have examined the extent to which this promise is realized. Moreover, the bulk of pediatric research conducted thus far has focused on Medicaid populations. By and large, the research suggests that the extent to which managed care can lead to savings, at least among low-income children, is unclear. One major analysis of twelve evaluations of Medicaid managed-care programs for children found that seven studies reported a decrease in costs, two reported increased costs, and the remaining studies had mixed, unchanged, or unknown results. Other research has found savings up to 15 percent among children on welfare in managed care (compared with traditional fee-for-service Medicaid), while other experiments have produced little or no savings.

Among the general population, the findings are more certain. Compared to fee-for-service, enrollment in managed care has led to cost savings, particularly lower out-of-pocket costs for patients. Specifically, 10 percent of families enrolled in HMOs in one study paid more than \$1,000 in out-of-pocket expenses, compared with 17 percent of families enrolled in other types of plans. Consequently, HMO enrollees were less likely to cite financial problems

as a barrier to care. However, they were more likely to report administrative barriers to care. It appears, though, that future cost savings may be limited, largely because lower costs to patients have translated into reduced profits for the health plans. As plans attempt to recoup these profits, out-of-pocket costs, such as co-payments for services, may rise.

### Conclusion

Because of the variability in managed-care plan organization and financing, much of the literature on managed care appears contradictory in its findings. In general, the research suggests that the extent to which managed care improves or impedes children's access to and utilization of quality care depends on the type of managed care, the health status of children who are enrolled, and the circumstances under which they are enrolled (voluntary versus mandatory enrollment).

However, lack of more definitive data on access, quality, and costs, particularly among nonpoor children, suggests a need for more research on this subject. More and better information of the impact of managed-care enrollment on costs and quality are especially needed. These remain areas in which most information is anecdotal and largely speculative. Given that managed care is likely to remain a major, if not dominant, method of health care financing and delivery, it is critical that more is understood about its impact on children, so that any needed modifications in the design and organization can be made.

DANA HUGHES  
KAREN DUDERSTADT

## MANN, HORACE (1796–1859)

Principal advocate of the nineteenth-century common school movement, Horace Mann became the catalyst for tuition-free public education and established the concept of state-sponsored free schools. The zeal with which Mann executed his plan for free schools was in keeping with the intellectual climate of Boston in the early days of the republic. The Mann contribution, state government sponsored education unfettered by sectarian control, made possible a democratic society rather than a government by elites. The atmosphere of early-nineteenth-

century Boston stimulated keen minds to correct social disharmonies caused by ignorance, intemperance, and human bondage. Reform that emanated from the Lockean notion that human nature may be improved by the actions of government motivated these New Englanders, who shaped social and political thought for generations.

Horace Mann was born in Franklin, Massachusetts, to Thomas Mann and Rebecca Stanley Mann. His parents lacked the means to educate their children beyond rudimentary ciphering and elementary reading. Therefore Mann's education consisted of no more than eight or ten weeks a year of sitting in tight rows on slab benches, learning from a schoolmaster barely out of his teens. Of his early schooling, Mann recalled, "Of all our faculties, the memory for words was the only one specially appealed to." A small lending library in Franklin circulated such books as John Bunyan's *The Pilgrim's Progress*. School days were minimal as the majority of the year was spent in haying, planting, and plowing. When Horace's father died of tuberculosis in 1809, the farm was left to an older son, Stanley Mann. The modest sum of \$200 was left to each child. Horace saved tuition by teaching his sister, Lydia, to read and write, instead of her attending school.

### Education and Training

Part of the bequest of Thomas Mann to Horace was spent on his tuition at Barrett's school. Horace was twenty in 1816, and his education to that point amounted to several dozen weeks scattered over nine years. At Barrett School under an exacting but sometimes intemperate schoolmaster, Mann first conjugated Latin verbs.

A half year at Barrett School fitted Mann for admission to the sophomore class at Brown University, where penury remained a constant problem for Mann. Mann graduated first in his class (1819) two years after arriving at the university. His oration, entitled "The Gradual Advancement of the Human Species in Dignity and Happiness," linked the success of the American political experiment directly to the development of its educational system. No valedictory speech has ever been more prophetic. Brown University president Asa Messer honored Mann by making him an instructor soon after his graduation. From 1820 until 1822 he taught Latin classics. Nine years later, Mann married Messer's daughter, Charlotte.

Mann's ambition was to train in the law at Judge Tapping Reeve's prestigious law school in Litchfield, Connecticut. At the time there was no better preparation for legal and political careers than Reeve's plain, free-standing law library located in the yard of his stately home in Litchfield. Meanwhile, Mann clerked in the office of Judge Fiske for thirteen months to earn tuition money. Mann arrived in Litchfield in 1822 for the course of study that took a year and a half and cost \$160. Then Mann became a clerk for Judge James Richardson in Dedham, Massachusetts, for several months until he was admitted to practice before the bar of the State of Massachusetts in 1823.

### Career and Contribution

Intemperance and the humane treatment of criminals were topics debated in polite society around Dedham, and Mann championed reforms ranging from temperance to religious toleration. He realized that through proper educating of the public, lasting change could be effected.

The positions of trust Mann achieved in Dedham in the 1820s made him confident to offer for the legislature in Massachusetts. The same year he was elected to the Dedham School Commission, he was also elected to the state's general assembly. Mann added the title legal counsel to the state supreme court, as well as commissioner to the new mental hospital, to his growing list of responsibilities.

After the death of his wife Charlotte in 1832, Mann liquidated his estate and resigned all offices, including his seat in the legislature. To those around him, it was apparent he planned to immerse himself in his work. Taking lodging at a boarding house in Boston, Mann joined the law firm of his old friend, Edward Loring. Boarders there were Boston notables such as Elizabeth Peabody, social crusader, and Reverend William Ellery Channing, the voice of Unitarianism in Boston. Elizabeth Peabody's sister, Mary, was there as well.

Friends persuaded him that he should stand for the Massachusetts senate in 1834 as a Whig. Mann had never competed politically at this level, and campaigns for senate races brought vitriolic debates not seen in his career before. As he celebrated his forty-first birthday, he contemplated his newest responsibility, president of the Massachusetts senate. This honor as a junior senator typifies the trust and

respect colleagues placed in his judgment. One issue that the senate wrestled with for several years prior to Mann's election was how public education could better prepare people for citizenship in this expanding young republic. As senate president, Horace signed into law the bill creating the Massachusetts State Board of Education, unique for its time and designed to disseminate education information state-wide and to improve curriculum, method, and facilities.

Educating the masses was also the concern of James G. Carter of Boston, and he published in 1825 the *Outline for an Institute for the Education of Teachers*. He wrote on the necessity of training teachers in the art of teaching. Normal schools were an outgrowth of this important early work in educational thought. Carter, a legislator, and Mann, president of the senate, maneuvered a revolutionary bill through both houses and to the desk of Governor Edward Everett.

The members of the board of the newly created State Department of Education selected Mann as its first secretary. Mann resigned his seat in the state senate. Mann, like many Bostonians, believed that the emphasis on public education held more promise than either government or religion for yielding lasting social reform. He accepted a 50 percent cut in pay, from \$3,000 a year to \$1,500. His personal journal records, "I have faith in the improbability of the race, in their accelerating improvability. . . ."

The struggle for common schools in Massachusetts defined the parameters of the free school movement for decades to come. Though Mann engaged in reforms such as temperance and the treatment of the insane, the perfection of the common school concept occupied his waking hours for the rest of his life. Mann argued that all citizens, regardless of race or economic status, should have equal access to a tuition-free, tax-supported public school system. Such a system must be responsive to all races and nonsectarian if society is to achieve the unshackled status of a true democracy.

Mann knew he had to convince the entire state that the common school system was desirable and worth the increased tax revenue. He conducted town meetings across the state, giving a speech "The Means and Objects of Common School Education." The obstacle was a populace that did not care whether more schooling was offered.

Mann's tour of the state's schools concluded with Salem, the town where Mary Peabody was

teaching. Once more, he pleaded for a statewide system of tuition-free education that would, he claimed, break down the troubling hierarchy of class in American society. Mann had spent months on tour, and much of what he had encountered discouraged him. Revenue would have to be raised to build adequate schools and staff them with learned teachers. There was the problem of poor versus wealthy districts; and that of the poor counties' being able to offer an education comparable to that of wealthy counties. Inadequate instruction troubled Mann as much as broken-down school buildings. He contemplated teacher training academies, called *normal schools*, as a solution.

Required by state law to make an annual report to the legislature on the condition of the state's school districts and programs, Mann turned the legal mandate into a yearly treatise on educational philosophy and methods. His annual reports became his platform for launching new programs and educating the public on new ideas in pedagogy. He explored new ideas in school design and the teaching of reading by words rather than by alphabet letters. Simple instruction in daily hygiene was emphasized along with more interesting ways of teaching science. Mann saw education as the uniting force to bring understanding and toleration between factions of the populace, as well as between the various states themselves. One novel idea Mann put forth was that teachers should gather together periodically to share ideas.

Mann developed the special teacher training colleges that he called normal schools. Instruction expertise rose yearly because the normal schools graduated capable teachers and eliminated the unfit. With teaching skills garnered from the normal school programs, teachers looked forward to a higher pay scale. Horace Mann was certain that better schools coupled with compulsory education would cure the ills of society. Traditional education did not vanish quickly in Massachusetts, however. Many found that curriculum and instruction varied little from content and materials of their grandparents' time.

Mann recalled the small library he had known while growing up. He believed that every child should have that advantage, so he set up a library expansion program. Mann also liked the German kindergarten idea that his confidant, Mary Peabody, espoused. Horace married Mary Peabody in 1843 in the bookstore that her sister, Elizabeth, ran on West

Street, a store that was a gathering place for William Ellery Channing, Ralph Waldo Emerson, Margaret Fuller, Nathaniel Hawthorne, and Henry David Thoreau. Mary's sister, Sophia, had wed Nathaniel Hawthorne there a few months earlier. Horace wished to take a trip to Europe to visit common schools, so they settled upon that idea as their honeymoon.

One person Mann wanted to meet in England was Charles Dickens, the social reformer and novelist. Dickens gave Mann and his wife a tour of London's wretched east side. The squalor was worse by far than anything Mann had seen in America. The English schools did not impress Mann, either. Recitation and Anglican dogma dulled the student's appetite for intellectual stimulation. He was amazed that teachers talked in monotone voices and stood transfixed during lecture. The Manns traveled widely in England and on the continent. While touring the University of Berlin, Horace learned that Alexander von Humboldt had implemented a state certification process and written examinations for teachers. Horace realized that this is what he must do in Massachusetts to eliminate the problem of incompetent teachers.

Mann's seventh annual report to the board was written partly on the voyage home. The comparisons he made with European schools, especially German schools, offended school administrators. Critics questioned Mann's credentials to lead school reform. Mann stood his ground for five more years and continued to bring uniformity to programs and quality of instruction.

Mann saw revenue for education rise precipitously over the twelve years of his tenure (1836–1848). He popularized the idea of a centralized bureaucracy to manage primary and secondary education. He advised the legislature on fiscal responsibility in implementing equal programs throughout the state. He standardized the requirements for the diploma.

When the eighth congressional seat became vacant due to the death of John Quincy Adams, Mann ran for the office and was successful in his first federal election. The two terms he spent in Washington were neither satisfactory nor productive. He had disagreements with his loyal political friends Daniel Webster and Charles Sumner. Against a backdrop of the rising tension over slavery, Horace sought a way out after his second term.

In 1852 Mann heard of a new college being built in Yellow Springs, Ohio, with support from a liberal Christian denomination. He decided that if the college presidency were offered, he would accept and resign from Congress. The post was offered, and Mann became the first president of Antioch College. The Ohio churchmen were so liberal in their doctrinal beliefs that they accepted Mann, a Unitarian. Antioch was a sectarian foundation and chapel attendance was not compulsory. Antioch College opened its doors to eight young men in 1850.

The Ohio frontier proved a different world from the East. Money was a problem from the start, grand illusions in the minds of the trustees never bore fruit, and paydays were missed regularly. Mann never compromised his expectations in scholarship. The financial problems at Antioch began before the buildings went up, and they steadily got worse.

The curriculum and methodology had all been Mann's development, and it was a creditable program. A preparatory school was added to accept the less qualified and was open to all no matter what race or gender. The mood of the populace, however, turned against Mann due to his Unitarian belief.

Mann turned his attention to the idea of publicly funded universities. He believed that church-sponsored colleges and universities undid the work of the free-school movement. The fight for the publicly funded university would be someone else's battle as Mann had developed a form of debilitating cancer. Mann's last educational act was to salvage the bankrupt Antioch College with a syndicate of New England investors. Mann died August 2, 1859. He could not have realized that he would become part of the legend of democracy built upon the foundation of a tuition-free public school system. Mann's last professional statement concluded the commencement address at Antioch College: "I beseech you to treasure up in your hearts these my parting words: Be ashamed to die until you have won some victory for humanity."

## MASTER'S DEGREE, THE

The master's degree is awarded upon completion of one to two years of advanced graduate study beyond the bachelor's degree, with the length depending on the field of study and the conferring institution. It recognizes heightened expertise in an academic discipline or professional field of study, gained through intensive course work and, in most cases, the preparation of a culminating project, scholarly paper, thesis, or a comprehensive examination.

### History

The master's degree has had somewhat a "checkered reputation" (Spencer, p. 5) in the United States. Since its debut in the 1850s at the University of Michigan, for instance, critics have questioned the academic legitimacy of the master's degree, dismissing it as a stepping-stone to the Ph.D. or as a consolation prize for those who failed to complete their doctoral studies.

Although historically viewed as ancillary to the doctorate, the changing nature of the U.S. workplace has contributed to a redefinition of the purpose and value of the master's degree in the latter quarter of the twentieth century. According to Eileen O'Brien, this "transformation occurred on an institution-by-institution basis, with the degree being adapted to offer an educational program focusing on specialization, professionalization, and career enhancement

and development” (p. 4). Findings from the Council of Graduate Schools’ sponsored National Study of Master’s Degrees, outlined in Clifton F. Conrad et al.’s 1993 work, established that the master’s degree is now frequently recognized as a significant—and often terminal—credential designating advanced preparation and training in a specialized area of study, most commonly for the purposes of entry into or advancement within the world of professional practice.

### **A Growing Demand**

The popularity of the master’s degree grew considerably during the last quarter of the twentieth century. Between 1970 and 1997, the number of master’s degrees annually conferred almost doubled from 230,000 to just over 430,000. In 2001 master’s degrees accounted for nearly one of every four degrees earned at the bachelor’s level and above in the United States.

Student and employer demand for advanced education and certification within professional fields of study has sparked much of the growth in master’s degree enrollments. These increases in demand have been spurred by broader global shifts toward a technology-driven, information-centered economy in which the need for highly trained, “expert” professionals in management, finance, information technology, and health care has skyrocketed. In 1970 for example, seven professional fields of study—business, computer and information science, education, engineering, health professions, library science, and public administration—accounted for slightly more than two-thirds of all master’s degrees annually conferred. In 1997 these professional fields combined for slightly more than three-fourths of all master’s degrees awarded. Particularly since the 1980s, it appears that the master’s degree has, at least for employers outside of academe, taken on a new “gatekeeper” role, functioning as an important credential for managing entry into and advancement within the professions. In physical therapy and library science, for example, the master’s is now generally regarded as an entry-level credential. In business, education, engineering, and nursing, the master’s is almost always required for advancement into more financially lucrative specialty and leadership positions.

### **A Changing Clientele**

As the reach of master’s education has expanded, the population of students earning the degree has diver-

sified. The percentage of women earning master’s degrees increased steadily over the past three decades, growing from 41 percent of degree recipients in 1970 to 56 percent in 1996. During this same time frame, the proportion of part-time and older students enrolling in master’s programs shifted considerably; by the mid-1990s, approximately three-fifths of all master’s students were enrolled part-time, and more than one-half were thirty years of age or older.

Educators have developed various strategies for meeting the needs of this changing clientele. Especially during the 1980s, a large number of colleges and universities began to offer master’s-level courses (and, in some cases, entire programs) in the evenings and on weekends. In the 1990s, the use of satellite-, videotape-, and web-based courses (and, again, entire programs) likewise became increasingly popular at the master’s level.

The overwhelming majority of master’s degree programs are course-work driven, but the number of required courses or credit hours varies by field of study and type of degree (for example, some master’s programs may be completed in as few as twenty-four semester credit hours; other master’s programs—including several in education—may require up to sixty semester credit hours). While approximately 70 percent of master’s degrees no longer require the completion of a thesis, most still include a comprehensive examination, which tests students on foundational knowledge in their field of study. Since the mid-1980s, a rising number of programs have begun to offer students the option of completing a final—or culminating—master’s project or paper as an alternative to a scholarly thesis. These projects or papers typically focus on applied problems, issues, or concerns relevant to the world of professional practice.

The growing practitioner orientation that has accompanied the increasing professionalization of the master’s degree has led to several interesting curricular changes in master’s programs. To begin with, the inclusion of part-time instructors who have extensive practitioner-based professional experience has become more commonplace. These practitioner faculty instructors are assumed to bring a real-world edge to the courses they teach, creating stronger linkages between theory and practice in the professions. Increasingly common as well is the inclusion of relevant professional work experience as a requirement for admission, particularly within the professional fields of business, education, and nurs-

ing. Finally, growing professionalization has also invited greater oversight by specialized accrediting bodies. In recent years several accrediting bodies that had traditionally focused largely on undergraduate education have begun to monitor the content and quality of master's degree programs in various fields, including business (Association to Advance Collegiate Schools of Business), education (National Council for Accreditation of Teacher Education), and nursing (National League for Nursing).

Unlike the National Research Council's *Survey of Earned Doctorates*, a national database is not maintained to study or track master's degree programs, students, or degree recipients. Other than the findings of a few scholars, there is comparatively little known about the general purposes, quality, and value of the master's degree and master's education in the United States.

## MATHEMATICS EDUCATION, TEACHER PREPARATION

Mathematics teachers are educated in diverse ways, depending to a great extent on the context in which the education occurs. Typically, pre-service teacher preparation occurs at the baccalaureate level, while in-service education occurs at the graduate level or is conducted by the local school systems in which the teacher is employed. There are, however, some pre-service programs in which participants acquire a masters' degree prior to beginning their teaching career.

In preparation for teaching at the elementary level, most undergraduate students take two mathematics courses that are either part of the institution's core liberal arts program or are designed specifically for elementary teaching majors. Additionally, it is likely that prospective elementary teachers will have one or two courses that deal specifically with the teaching of elementary school mathematics. Concerns that teachers at the elementary level need more background in mathematics have resulted in recent trends toward upgrading the mathematical education of prospective elementary teachers. Secondary teachers typically have a major in mathematics, or a closely related field, with an additional course (or courses) in mathematics education. Smaller programs are more likely to offer only a single course in mathematics education. The education of prospective middle school teachers is very dependent on the type of institution. In some schools, middle school teaching majors follow a program similar to the elementary majors, but with extra courses in mathematics; in others, they take a program for secondary school pre-service teachers specializing in mathematics, with one or more additional courses in middle school education. A few larger universities have programs designed specifically for the prospective middle school mathematics teacher. The following sections focus on the intent and foci of the different programs.

### The Evolution of Mathematics Teacher Education

Before 1960 most teacher education programs for secondary school mathematics teachers consisted of training in mathematics, a methods course of some kind, and student teaching. Smaller programs at colleges or universities tended to have generic methods courses that addressed the needs of secondary teach-

ers of all subjects. One can glean an understanding of the content-specific methods courses by considering the methods texts of that time. For example, the popular 1960 methods text by Charles Butler and Frank Wren (first published in 1941) consisted of two sections. The first section dealt with general issues such as planning for instruction. The second section was decidedly mathematical, with specific suggestions for teaching topics such as arithmetic, algebra, geometry, and trigonometry. There was a clear distinction between these two sections. Donovan Johnson and Gerald Rising's innovative 1967 text was based on what mathematics teachers do in the classroom. As such, it addressed issues specific to the teaching and learning of mathematics. A 1975 text by Thomas Cooney, Edward Davis, and Kenneth Henderson for secondary mathematics teachers also had a very distinct pedagogical orientation based on research on how teachers teach mathematics. Whereas the Johnson and Rising text was based primarily on teachers' daily responsibilities, the Cooney, Davis, and Henderson text was based on a theoretical analysis of teachers' verbal actions, called moves, and the way those moves were used to teach mathematical concepts, generalizations, and skills.

During the 1960s and 1970s educators began to see the value in studying the teaching and learning of mathematics more specifically. Out of this new focus on research grew an interest in developing a psychological basis for understanding why some students learned but others did not, and what kind of teaching methods and curricula could affect student learning. This growing knowledge base contributed to mathematics teacher education as well.

### The Evolution of Mathematics Education as a Field of Inquiry

Prior to 1960 there was little research on how children learn mathematics and how teachers teach mathematics. The teacher's job was seen primarily as a matter of telling students the mathematics they were expected to learn. But as research in mathematics education matured, questions arose about how students understand mathematics. Consider, for example, the variation in understanding of mathematics conveyed in the responses of two students to the following questions:

Are there any numbers between 440 and 450 that are divisible by 7? Why or why not?

**Response of Student 1:** There must be a number because 7 is less than 10. So in

every 10 numbers there has to be at least one that is divisible by 7. (Student elaborates for entire page.)

**Response of Student 2:** There is no number because 440 and 450 is not divisible by 7—44 is not, 45 is not, and 0 is not.

The response of student 1 reveals a deep understanding of how numbers work, while the response of student 2 demonstrates some understanding of divisibility, since 44 and 45 are not divisible by 7, but fails to capture the mathematical essence of the question. If the interest of teacher educators in evaluating these two responses goes beyond one student having gotten it right and the other student not, then they can begin to ask how a teacher could enable the second student to better understand divisibility. Indeed, teacher education today focuses, in part, on enabling teachers to create and use such questions so that they can better analyze their students' understanding of mathematics. Simply put, the education of mathematics teachers entails a certain kind of knowledge that involves mathematics, psychology, and ways of teaching mathematics that are more effective than simply telling students what mathematics is and what the answers to various problems are. This knowledge base has grown substantially over the past decades because of the extensive research in mathematics education.

### In-Service and Staff Development Programs

An appreciation of the complexity of teaching has led teacher educators to move toward programs in which teachers are provided with extensive training and support to implement new practices—such as problem-solving techniques or infusing technology into their teaching. There is mounting evidence that teachers need support and time if they are to reform their practice. For example, the successful professional development program by Raffaella Borasi, Judith Fonzi, Constance Smith, and Barbara Rose not only emphasizes having teachers interact with materials designed to foster student inquiry but also provides teachers with support as they use the materials in their classroom. Some in-service programs engage teachers in deep experiences with the mathematics they are teaching, thereby giving them new insights into their students' understanding of that mathematics. Programs that encourage teachers to reflect on the types of experiences they have and are providing to their students are becoming increasingly popular.

### Trends, Issues, and Controversies

Perhaps the single most significant force affecting mathematics teacher education today has been the development of standards for school mathematics by the National Council of Teachers of Mathematics (NCTM). Through these standards, the NCTM has taken the view that mathematics is a subject suitable for inquiry and not just memorization, a subject that can be learned by all students and should be taught with an emphasis on processes such as problem solving, reasoning, communicating mathematically, and connecting mathematics to the real world. One way or another, most teacher education programs today embody the NCTM standards. Controversies about this approach stem from several questions, including: What constitutes mathematics? and, Should mathematics teacher education programs be about reform or about maintaining the status quo?

### The Nature of Mathematics

Different segments of society possess different views about what constitutes mathematics. Some think of mathematics as a collection of rules and procedures to be learned and applied for basic living. From this perspective, the teaching of mathematics relies on those methods best suited to promote the acquisition of skills. Others see mathematics as a basis for developing critical thinking and problem-solving skills. From this second perspective, which is closely aligned to the NCTM Standards, teacher education encourages reflection and promotes attention to problem solving and critical thinking. How a community defines mathematics affects what, and how, mathematics gets taught in the local schools. It can also have an impact on how teachers are trained to teach in those schools.

### The Intent of Teacher Education Programs

There is always a certain tension between the intellectual preparation of teachers and the practice of teaching as manifested in student teaching. Those from outside the field of mathematics education often take the position that teacher education should be modeled after an apprenticeship program. That is, one learns mathematics and then works in the schools to acquire the necessary pedagogical skills to be a successful teacher. This type of program tends to promote the status quo, as young teachers model those methods of teaching that they experienced as students. Teacher educators, however, usually take the position that a greater part of the program

should be devoted to transforming the teaching of mathematics from a “teaching is telling” approach to an inquiry-based teaching style that is student centered. The notion of *constructivism* is often used to describe this latter kind of teaching; that is, children construct their own mathematical ideas, and teachers need to be aware of these constructions in order to effectively teach the children.

The preparation and education of mathematics teachers, like any educational endeavor, exists in a sociopolitical environment that ultimately shapes the enterprise. Conditions of the workplace also shape what transpires in classrooms. These circumstances affect mathematics teacher education programs as well. Schools today are run much as they were in yesteryear, thus perpetuating a certain conservatism with respect to reform. This approach strengthens the position of those who advocate an apprenticeship form of teacher education. Evidence suggests that the United States is experiencing, and will continue to experience, serious teacher shortages, particularly in mathematics. Such shortages usually preclude more extensive training in favor of short, intense programs that are less demanding on the schools’ staffing resources.

On the other hand, reform-based teacher education programs enjoy the support of such national organizations as the NCTM and are rooted in the thinking of scholars such as John Dewey. Dewey’s notion of *reflective thinking*, albeit adapted and modified, is part and parcel of most current teacher education programs. Indeed, if the position is taken that education is about educating young people to become thinking citizens in a democratic society, then the education of teachers to infuse problem solving, reasoning, and critical thinking into their teaching should be of paramount importance. In some sense, the notion of what constitutes a good teacher education program is dependent on what one values regarding society’s education of its young people.

### ALGEBRA

Algebraic reasoning is a major development (circa 800), both culturally and individually. Culturally, the invention of algebraic representations in graphical and symbolic form is viewed as central for the advancement of mathematics and science. Algebra provides a succinct notation for recording mathematical relationships and describing computational algorithms and scientific laws. Algebraic reasoning is viewed as a major conceptual advancement beyond arithmetic thinking. For individuals, algebra can serve as a *thinking tool*, or, more aptly, a toolkit, for describing relationships in terms of unknown quantities and modeling complex and dynamic situations. For many, algebra instruction is the sole source for the formal study of abstract representations and problem solving.

Algebra has also been identified as a societal gatekeeper for further development of mathematical

and scientific instruction, and for wide-ranging economic opportunities. Consequently, at the beginning of the twenty-first century, there is a major shift in the United States to move algebra education into the middle and primary grades, and to reconceptualize instruction appropriately for these age groups. The utility of algebra is boundless. However, learning and teaching algebra, particularly algebra word problems, is often viewed as the bane of mathematics education.

### What Is Algebra?

Abstract algebra refers to the use of formal mathematical structures and symbols, such as  $F(X)$ , to represent relations between terms or objects. It includes the operations that operate on those structures, such as the inverse,  $F^{-1}(X)$ , and the identity,  $I(X)$ . An especially important structure is the *function*, which specifies a one-to-many relationship (or mapping) between an independent variable (the *input*) and a set of dependent variables (the *output*).

School-based algebra is most commonly viewed as the generalization of arithmetic to include the use of literal symbols (such as the letters  $X$  and  $Y$ ) and arbitrarily complex symbolic expressions. School algebra also includes the study of functions as well as the construction of abstract formalisms that inductively describe a pattern of instances, predict future instances, and characterize the general form of the pattern (e.g., linear).

### Challenges of Learning Algebra

To encompass the multifaceted nature of school-based algebra, new concepts arise that contribute to its learning difficulties. The *variable* is expanded from being a place-holder (or box) in arithmetic, to representing an unknown value or set of values that stand in relation to (and may covary with) other values and expressions. Symbols that represent variables in algebra must denote the same thing everywhere in a problem, but generally take on new meanings with each new problem.

Detailed analyses of problem solving show that result-unknown problems, such as  $25x+8=?$ , are solvable by direct application of the arithmetic operators, or by using counting objects to physically model the number sentence; whereas start-unknown problems, such as  $25Y+8=108$ , defy modeling and are considered to be algebraic. Both children and adults exhibit lower levels of performance with start-unknown than with result-unknown problems.

In algebra, the equal sign ( $=$ ) takes on a relational or structural role, as when two sides of an equation are compared, such as  $25Y=108$ . This is in addition to its operational role in arithmetic where the equal sign signals one to perform a computation, as with  $25x+8=?$ . Facility with and among multiple representations, including symbolic, tabular, graphical, and verbal formats, is an important aspect of algebraic reasoning, as is an understanding of the relative utility of each. Each representational format has unique advantages. However, in practice, equations receive far more attention than other representations, such as graphs.

The prototypical activities for school-based algebra are solving symbolic equations and word problems. Equation solving most typically involves applying legal rules of symbolic manipulation to isolate an unknown value (see Figure 1, part a). Legal rules typically entail performing the same symbolic calculations to both sides (such as subtracting 10 from both sides of Equation 1 in step 1) to maintain the relations specified in the original problem.

Novices often perform actions that violate the syntactic, hierarchically nested relationships contained in equations, and so inappropriately change their original meanings. For example, in Figure 1 it is algebraically illegal to combine 10 and 5 in step 1 because the original relation is no longer preserved. However, preconceptions from reading and arithmetic, where processing is done from left to right, can lead students to misstep.

Word-problem solving is the next most common activity in algebra education. Word problems can be in the form of a story (Figure 1, part b), or a word equation (Figure 1, part c). Although based on the same quantitative relations as Equation 1, students perform very differently on these three tasks. A misconception generally held by high school mathematics teachers is that high school students solve Equation 1 more easily than a matched story problem or word equation. Teachers justify this prediction by noting that a student must first write a symbolic equation that models the verbal statement, and that this invites other types of errors. While translation from words to mathematical expressions is error-ridden for novices, high school students typically circumvent this step when permitted. Instead, they use highly reliable informal methods, such as guess-and-test and working backwards, which produce higher levels of performance than equation solving.

FIGURE 1

**Three forms of a start-unknown problem: (a) symbolic form, and the manipulation steps for solving the algebraic equation; (b) story problem; and (c) word equation**

(a) Solve for X:  $10+5X=30$  (Equation 1)

1.  $10+5X-10=30-10$
2.  $(10-10)+5X=(30-10)$
3.  $0+5X=20$
4.  $(5X)/5=20/5$
5.  $(5/5)X=4$
6.  $X=4$

(b) Story problem: Starting at the 10-mile mark, Robin walked 5 mph. How much time will it take her to travel 30 miles?

(c) Word equation: If I multiply some number by 5 and then add 10, I get 30. What is the original number?

### Curricular and Technological Advances in Algebra Education

Like many algebra teachers, traditional algebra textbooks take a largely *symbol precedence* view of the development of algebraic reasoning, introducing algebraic concepts through symbolic problem solving, and later applying them to verbal reasoning activities. In contrast, several alternative curricula have recently emerged that begin by eliciting students' invented strategies and representations for describing patterns and data, and developing from these inventions algebraic equations and graphs through a process called *progressive formalization*. These reform-based curricula typically draw on problem-based learning (PBL), which emphasizes complex, multi-day, collaborative problem solving. Three of these approaches, Mathematics in Context, Connected Mathematics, and The Adventures of Jasper Woodbury, have produced commercially available curricula that cover the major topics in middle grade mathematics, such as geometry and algebra.

Technology has also been effectively wedded to innovative curriculum designs. Graphing calculators have had a profound effect on the teaching of algebra using graphical, tabular, and programming forms. The Algebra Sketchbook supports the relationship between verbal descriptions and graphics. The Animate system helps students to construct situation-based meaning for equations. Jasper uses multimedia to present rich problem contexts and encourage production of Smart Tools, representa-

tions that support modeling, analysis, and comparison. The Pump Algebra Tutor provides individualized computer-based instruction by relying on adaptive cognitive models of individual students.

## COMPLEX PROBLEM SOLVING

In April 2000, the National Council of Teachers of Mathematics (NCTM) published *Principles and Standards for School Mathematics*, a document intended to serve as "a resource and a guide for all who make decisions that affect the mathematics education of students in prekindergarten through grade 12," and that represented the best understandings regarding mathematical thinking, learning, and problem solving of the mathematics education community at the dawn of the twenty-first century. It also reflected a radically different view from the perspective that dominated through much of the twentieth century.

*Principles and Standards* specifies five mathematical content domains as core aspects of the curriculum: number and operations, algebra, geometry,

measurement, and data analysis and probability. These content areas reflect an evolution of the curriculum over the course of the twentieth century. The first four were present, to various degrees, in 1900. Almost all children studied number and measurement, which comprised the bulk of the elementary curriculum in 1900. Algebra and geometry were mainstays of the secondary curriculum, which was studied only by the elite; approximately 10 percent of the nation's fourteen-year-olds attended high school. Data analysis and probability were nowhere to be seen. Over the course of the twentieth century, the democratization of American education resulted in increasing numbers of students attending, and graduating from, high school.

Curriculum content evolved slowly, with once-advanced topics such as algebra and geometry becoming required of increasing numbers of students. The study of statistics and probability entered the curriculum in the 1980s, and by 2000 it was a central component of most mathematics curricula. This reflected an emphasis on the study of school mathematics for "real world" applications, as well as in preparation for mathematics at the collegiate level.

While content changes can thus be seen as evolutionary, perspectives on mathematical *processes* must be seen as representing a much more fundamental shift in perspective and curricular goals. Given equal weight with the five content areas in *Principles and Standards* are five process standards: problem solving, reasoning and proof, communication, connections, and representation. All of these are deeply intertwined, representing an integrated view of complex mathematical thinking and problem solving. Problem solving might be viewed as a "first among equals," in the sense that the ultimate goal of mathematics instruction can be seen as enabling students to confront and solve problems—not only problems that they have been taught to solve, but unfamiliar problems as well. However, as will be elaborated below, the ability to solve problems and to use one's mathematical knowledge effectively depends not only on content knowledge, but also on the process standards listed above.

Solving difficult problems has always been the concern of professional mathematicians. Early in the twentieth century, *problem books* were viewed as ways for advanced students to develop their mathematical understandings. Perhaps the best exemplar is George Pólya and Gabor Szegő's *Problems and Theorems in Analysis*, first published in 1924. The

book offered a graded series of exercises. Readers who managed to solve all the problems would have learned a significant amount of mathematical content, and (although implicitly) a number of problem-solving strategies.

The idea that one could isolate and teach strategies for problem solving remained tacit until the publication of Pólya's *How to Solve It* in 1945. Pólya introduced the notion of *heuristic strategy*—a strategy that, while not guaranteed to work, might help one to better understand or solve a problem. Pólya illustrated the use of certain strategies, such as drawing diagrams; “working backwards” from the goal one wants to achieve; and decomposing a problem into parts, solving the parts, and recombining them to obtain a solution to the original problem. Pólya's ideas resonated within the mathematical community, but they were exceptionally difficult to implement in practice. For example, while it was clear that one should draw diagrams, it was not at all clear which diagrams should be drawn, or what properties those diagrams should have. A problem could be decomposed in many ways, but it was not certain which ways would turn out to be productive.

Means of addressing such issues became available in the 1970s and 1980s, as the field of artificial intelligence (AI) flourished. Researchers in AI wrote computer programs to solve problems, basing the programs on fine-grained observations of human problem solvers. Allen Newell and Herbert Simon's classic 1972 book *Human Problem Solving* showed how one could abstract regularities in the behavior of people playing chess or solving problems in symbolic logic—and codify that regularity in computer programs. Their work suggested that one might do the same for much more complex human problem-solving strategies, if one attended to fine matters of detail. Alan Schoenfeld's 1985 book *Mathematical Problem Solving* (and his subsequent work) showed that such work could be done successfully. Schoenfeld provided evidence that Pólya's heuristic strategies were too broadly defined to be teachable, but that when one specified them more narrowly, students could learn to use them. His book provided evidence that students could indeed learn to use problem-solving strategies—and use them to solve problems unlike the ones they had been taught to solve. It also indicated, however, along with other contemporary research, that problem solving involved more than the mastery of relevant knowledge and powerful problem-solving strategies.

One issue, which came to be known as *metacognition* or *self-regulation*, concerns the effectiveness with which problem solvers use the resources (including knowledge and time) potentially at their disposal. Research indicated that students often fail to solve problems that they might have solved because they waste a great deal of time and effort pursuing inappropriate directions. Schoenfeld's work indicated that students could learn to reflect on the state of their problem solving and become more effective at curtailing inappropriate pursuits. This, however, was still only one component of complex mathematical behavior.

Research at a variety of grade levels indicated that much student behavior in mathematics was shaped by students' beliefs about the mathematical enterprise. For example, having been assigned literally thousands of “problems” that could be solved in a few minutes each, students tended to believe that all mathematical problems could be solved in just a few minutes. Moreover, they believed that if they failed to solve a problem in short order, it was because they didn't understand the relevant method. This led them to give up working on problems that might well have yielded to further efforts. As Magdalene Lampert observed, “Commonly, mathematics is associated with certainty; knowing it, with being able to get the right answer, quickly. These cultural assumptions are shaped by school experience, in which *doing* mathematics means following the rules laid down by the teacher; *knowing* mathematics means remembering and applying the correct rule when the teacher asks a question; and mathematical *truth is determined* when the answer is ratified by the teacher. Beliefs about how to do mathematics and what it means to know it in school are acquired through years of watching, listening, and practicing” (p. 31).

Lampert argued that the very practices of schooling resulted in the development of inappropriate beliefs about the nature of mathematics, and that those beliefs resulted in students' poor mathematical performance. Given the link between students' experiences and their beliefs, the necessary remedy was to revise instructional practices—to create instructional contexts in which students could engage in mathematics as an act of sense-making, and thereby develop a more appropriate set of knowledge, beliefs, and understandings.

Research on mathematical thinking and problem solving conducted in the 1970s and 1980s estab-

lished the underpinnings for the first major “reform” document, *Curriculum and Evaluation Standards for School Mathematics* (1989), also published by NCTM. The climate was right for change, for the nation was concerned about its students’ mathematical performance. Reports such as *A Nation at Risk* (1983) had documented American students’ weak mathematical performance in comparison to that of students from other nations, and there was a sense of national crisis regarding the nation’s mathematical and scientific capacities. In the early 1990s the U. S. National Science Foundation began to support the development of curricular materials consistent with emerging research on mathematical thinking and learning. The first wave of curricula developed along these lines began to be adopted in the late 1990s.

Many of the new curricula call for students to work on complex problems over extended periods of time. In some cases, important mathematical ideas are introduced and developed through working on problems, rather than taught first and “applied” later. Either way, the fundamental idea is that students will need to have opportunities to develop both the content and process understandings described in *Principles and Standards*. As indicated above, this calls for changes in classroom practices. The best way for students to develop productive mathematical dispositions and knowledge is for them to be supported, in the classroom, in activities that involve meaningful mathematical problem solving. Given a complex problem, students can work together, under the guidance of a knowledgeable teacher, to begin to understand the task and the resources necessary to solve it. This can help them develop productive mathematical dispositions (i.e., the understanding that complex problems will yield to sustained, systematic efforts) and analytic skills. Complex problems may span mathematical areas or be drawn from real-world applications, thus helping students make mathematical connections.

Understanding and working through such problems calls for learning various representational tools—the symbolic and pictorial languages of mathematics. Tasks that call for explaining one’s reasoning (i.e., asking students to make a choice between two options and to write a memo that justifies their choice on mathematical grounds) can help students develop their skills at mathematical argument. They also reinforce the idea that obtaining an answer is not enough; one must also be able to convince

others of its correctness. Teachers can help students understand that there are standards for communicating mathematical ideas. The arguments students present should be coherent and logical, and ultimately, as students develop, formalizable as mathematical proofs. In these ways, complex problem solving becomes a curricular vehicle as well as a curricular goal.

## GEOMETRY

Geometry originated in the ancient practice of earth measurement used in agriculture, the building of pyramids, and the observation of the patterns in the movement of the stars applied in navigation. In spite of the very practical origin of geometry in the investigation of the world, geometry is also the subject area where the development of abstract reasoning began, culminating in the first systematic organization of mathematical knowledge by Euclid around 300 B.C.E. Euclid's deductive system, built on definitions, postulates, theorems, and proofs, has served as the blueprint for representing mathematical knowledge since its inception.

Tension between the experiential, empirical origins of geometry and its abstract deductive representation characterizes contemporary instructional practice and research. Critics of the traditional Euclidean approach to the teaching and learning of geometry argue that the severance of geometric knowledge from its foundation in an inherently geometric world is a pedagogical error.

Educators in the United States have been reluctant to introduce geometry in the primary grades. The traditional view of geometry as an exemplification of abstract reasoning and a fear of exposing students prematurely to formal thinking may be among the reasons for this reluctance. When primary grade teachers choose to spend a short instructional period on geometry, it is usually limited to having students

recognize and recall the names of prototypical two-dimensional shapes like triangles, squares, and rectangles. This practice fails to take advantage of the host of informal geometric knowledge children bring to school.

Even before entering school, children develop intuitions about geometric shapes and their characteristics during their early explorations with their environment. For example, in exploring the objects around them, children experience that surfaces can be bumpy or smooth. Building with blocks or stacking other objects, children learn about differences in forms and sizes. Using boxes and other containers, they form intuitive ideas of space-filling or volume. As children walk around in their neighborhood they develop informal notions of spatial arrangements, distance, and directionality. The learning of geometry can be built on this naturally acquired spatial sense. Guiding children to reflect on the characteristics and regularities of their spatial experience can easily lead to the development of the basic concepts (abstractions) of geometry, such as straight and curved lines, points as intersections, planes, and planar and three-dimensional shapes. Uncultivated or ignored, however, children's natural spatial sense fades away, and it is difficult to retrieve it for use when students enroll in their first official geometry course in high school.

A programmatic document, the 1989 *Curriculum and Evaluation Standards for School Mathematics*, produced by the National Council of Teachers of Mathematics (NCTM) to guide reform in mathematics education, recommends that geometric topics be introduced and applied to real-world situations whenever possible. However, this does not imply that immersing children in real-world situations automatically leads to mathematical or geometrical understanding. Hands-on activities are a popular way to establish a connection between instruction and real life, but as instructional means they are only as good as the meanings derived from them. The challenge of geometry instruction is to elevate children's experience with real-world objects to the level of mathematics.

This happens in well-designed instructional tasks that promote reflection on the geometric features of real-life situations, leading to the development of geometric concepts and spatial reasoning. Children learn to generate geometric arguments by participating in carefully orchestrated conversations where they articulate, share, and discuss their ideas

regarding spatial problems. Children develop skills of modeling spatial situations when they are invited to publicly display and discuss their visualizations in drawings. These drawings can then be turned into mathematical representations during revision cycles, in the course of which the geometrical features are accentuated while the mathematically irrelevant features (e.g., material, color, and other decorative elements) gradually fade away.

At the secondary level, the traditional Euclidean geometry curriculum that revolves around deductive proof procedures has been criticized because it separates geometry from its empirical, inductive foundation. Critics refer to the typical lack of student appreciation for the subject—often accompanied by low achievement. The deductive organization of the geometry course has been seen as a viable model to help introduce students to mathematical reasoning. However, this is a misrepresentation of the actual reasoning that goes on among expert mathematicians. The deductive logic applied in proofs constitutes only a subset of the rules, and it seldom accounts for the actual thought processes that contributed to the discovery communicated in a proof. Actual discovery usually follows an inductive line of reasoning that begins with empirical investigation and the observation of regularities. It continues with making conjectures based on the observed regularities, and then testing them on multiple examples. Attempts at explaining and generalizing the observed relationship with the help of proof come only after the long process of empirical exploration.

Alternatives to a traditional Euclidean secondary geometry curriculum have been offered based on this more grounded view of mathematical reasoning that incorporates exploration and induction. In the process of exploration, students learn to deconstruct geometric objects into their constitutive elements, and to rely on properties—such as the number and relative size of the sides of the objects, the measure of angles, and their relationships—rather than a prototypical or customary presentation of an image when they identify shapes. Ideally, students will learn to go beyond the appearance of an actual drawing of a shape and argue about generalized concepts of shapes as defined by their properties (for example, a rectangle is a quadrilateral with four right angles and with opposite sides equal and parallel). These skills serve as the foundation of geometrical understanding and need to be acquired—ideally in the primary grades—before students are exposed to proofs.

Some of the new secondary geometry curricula have been organized around technology tools, including geometry construction programs such as the Geometer's Sketchpad and the Geometric Super-Supposer. These programs provide an electronic environment for geometric explorations and allow the learner to generate multiple solutions of geometric construction problems, thus facilitating the generation and testing of hypotheses. Proofs gain a different meaning in this context, becoming the means of explaining why the conjectures developed by the students themselves hold beyond the examples created by the program. This has a motivating effect on the learner. Without such an inductive foundation, students see proofs as an unnecessary procedure to arrive at a simple truth that they already know and accept.

## LEARNING TOOLS

The manner in which students learn mathematics influences how well they understand its concepts, principles, and practices. Many researchers have argued that to promote learning with understanding, mathematics educators must consider the tasks, problem-solving situations, and tools used to represent mathematical ideas. Mathematical tools foster learning at many levels—namely, the learning of facts, procedures, and concepts. Tools can also provide concrete models of abstract ideas, or, when dealing with complex problems, they can enable students to manipulate and think about ideas, thereby making mathematics accessible and more deeply understood.

Mathematical learning tools can be traditional, technological, or social. The most frequently employed tools are traditional, which include physical objects or manipulatives (e.g., cubes), visualization tools (e.g., function diagrams), and paper-and-pencil tasks (e.g., producing a table of values). Technological tools, such as calculators (i.e., algebraic and graphic) and computers (e.g., computation and multiple-representation software), have gained attention because they can extend learning in different ways. Social tools, such as small-group discussions where students interact with one another to share and challenge ideas, can be considered a third type of learning tool. These three tools can be used independently or conjointly, depending on the type of learning that is intended.

### Learning Tools in Mathematics

A learning tool can be as simple as an image or as complex as a computer-based environment designed to improve mathematical understanding. The key characteristic of a learning tool is that it supports learners in some manner. For example, a tool can aid

memory, help students to review their problem-solving processes, or allow students to compare their performance with that of others, thereby supporting self-assessment. Learning tools can represent mathematical ideas in multiple ways, providing flexible alternatives for individuals who differ in terms of learner characteristics. For example, learners who have difficulty understanding the statistical ideas of arithmetic mean (center) and variance (spread) may be assisted through interactive displays that change as data points are manipulated by the learner. A mathematical learning tool can scaffold the learner by performing computations, providing more time for students to test mathematical hypotheses that require reasoning. In the statistics example, learners can focus on why changes to certain parameters affect data—and in what ways, rather than spending all their time calculating measures.

**Traditional Tools.** Traditional tools are best suited for facilitating students' learning of basic knowledge and skills. Objects that can be manipulated, such as cubes, reduce the abstract nature of concepts, such as numbers, thereby making them real and tangible, particularly for younger children. Such tools support the development of children's understanding of arithmetic by serving as a foundation for learning more complex concepts. Visualization tools, such as graphs, can support data interpretation, while paper-and-pencil tools that provide practice of computational skills can support memory for procedures and an ability to manipulate symbols. Combining physical tools with visualization tools can substantively increase students' conceptual knowledge. Dice and spinners, for example, can be used to support elementary school students in creating graphs of probability distributions, helping them develop an understanding of central tendency.

**Technological Tools.** Technological tools are most effective in facilitating students' understanding of complex concepts and principles. Computations and graphs can be produced quickly, giving students more time to consider why a particular result was obtained. This support allows students to think more deeply about the mathematics they are learning. Electronic tools are necessary in mathematics because they support the following processes: (a) conjectures—which provide access to more examples and representational formats than is possible by hand; (b) visual reasoning—which provides access to powerful visual models that students often do not create for themselves; (c) conceptualization and

modeling—which provide quick and efficient execution of procedures; and (d) flexible thinking—which support the presentation of multiple perspectives.

Spreadsheets, calculators, and dynamic environments are sophisticated learning tools. These tools support interpretation and the rapid testing of conjectures. Technology enables students to focus on the structure of the data and to think about what the data mean, thereby facilitating an overall understanding of a concept (e.g., function). The graphics calculator supports procedures involving functions and students' ability to translate and understand the relationship between numeric, algebraic, and graphical representations. Transforming graphical information in different ways focuses attention on scale changes and can help students see relationships if the appropriate viewing dimensions are used. Computers may remove the need for overlearning routine procedures since they can perform the task of computing the procedures. It is still debatable whether overlearning of facts helps or hinders deeper understanding and use of mathematics. Technology tools can also be designed to help students link critical steps in procedures with abstract symbols to representations that give them meaning.

Video is a dynamic and interactive learning tool. One advantage of video is that complex problems can be presented to students in a richer and more realistic way, compared to standard word problems. An example is *The Adventures of Jasper Woodbury*, developed by the Learning Technology Center at Vanderbilt University. Students are required to solve problems encountered by characters in the Woodbury video by taking many steps to find a solution. This tool supports students' ability to solve problems, specifically their ability to identify and formulate a problem, to generate subgoals that lead to the solution, and to find the solution. However, the information presented in a video cannot be directly manipulated in the same way that data can be changed in spreadsheets and calculators.

Learning tools that present the same information in several ways (e.g., verbal equation, tabular, graphic) are referred to as multiple-representation tools. The ability to interpret multiple representations is critical to mathematical learning. There is evidence to suggest that multiple representations can facilitate students' ability to understand and solve word problems in functions, and to translate words into tables and graphs. However, interpretation is not easy without some kind of support. One type of

support involves highlighting common elements between the different representations to make the relationship between each explicit, thereby facilitating interpretation in both contexts. In some cases, this type of support is insufficient and students need to be explicitly taught to make the connections. Multiple representations can be a powerful learning tool for difficult problems—when students have acquired a strong knowledge base.

Additional research is needed to determine the exact benefits of multiple representational tools. It is important to emphasize that, as with any educational innovation, mathematical learning tools must be designed with a consideration of the teacher, curriculum, and student in mind. For example, with the help of curricular teams and teachers, complex computer environments that present students with multiple representation tools for learning algebra and geometry were successfully adopted in several school systems in the United States.

**Social tools.** Social tools are a fairly recent consideration. In the 1990s, small-group work where students share strategies for solving problems began to be used as a powerful learning tool. This tool facilitates students' ability to solve word problems and to understand arithmetic. Group collaboration while learning with technology can help students develop the perspectives and practices of mathematics, such as what constitutes acceptable mathematical evidence. Peers and computers can provide feedback that makes students aware of contradictions in their thinking. In this way, social tools can assist learning and transform understanding.

### Issues for Further Consideration

Mathematical learning tools should be an important part of students' educational experience. However, a few issues must be addressed before their potential is fully realized. First, use of technological tools is fairly limited in classrooms, despite their potential in changing the nature of mathematical learning. Moreover, software used in schools is often geared towards the practice of computational skills. For example, there may be a potential misuse of the graphing calculator if it is not utilized in the context of sense-making activities. There is a fine line between using a tool for understanding and using it because problems cannot be solved without its use.

Second, learning tools should be an integral part of instructional activities and assessment tasks.

Learning tools should be a regular part of the mathematics experience at every educational level, and different tools should be used for various purposes. The question of ethics and equity is raised when technological tools that are used in instruction are not accessible in assessment situations.

Third, learning tools will only meet their promise through professional development. Teachers who understand the strengths and weaknesses of tools can have a strong impact on how they are used. Support is needed at all levels of education to ensure that sophisticated learning tools are available for use in every mathematics classroom. Learning tools are only as good as the activities that provide the mathematical experiences. The effectiveness of such tools is thus highly dependent on the purpose of the activity and the learning that is intended.

#### MYTHS, MYSTERIES, AND REALITIES

According to the National Research Council, "Much of the failure in school mathematics is due to a tradition of teaching that is inappropriate to the way most students learn" (p. 6). Yet, despite the fact that numerous scientific studies have shown that traditional methods of teaching mathematics are ineffective, and despite professional recommendations for fundamental changes in mathematics curricula and teaching, traditional methods of teaching continue. Indeed, mathematics teaching in the United States has changed little since the mid-twentieth century—essentially, teachers demonstrate, while students memorize and imitate.

#### Realities

Although research indicates that learning that emphasizes sense-making and understanding produces a better transfer of learning to new situations, traditional classroom instruction emphasizes imitation and memorization. Even when traditional instruction attempts to promote understanding, most students fail to make sense of the ideas because classroom derivations and justifications are too formal and abstract. Though research indicates that mathematical knowledge is truly understood and us-

able only when it is organized around and interconnected with important core concepts, traditional mathematics curricula make it difficult for students to meaningfully organize knowledge. This is because such curricula provide little time for, or attention to, the type of sense-making activities that enable students to genuinely understand and organize mathematical knowledge. Indeed, the major finding that caused the authors of the Third International Mathematics and Science Study (TIMSS) to characterize the U.S. mathematics curricula as “a mile wide and inch deep” is that traditional curricula cover far too many topics, almost all superficially. As a result, though the same topics are retaught yearly, many are never learned, and few are truly understood.

Furthermore, because traditional instruction focuses so much on symbolic computation procedures, many students come to believe that mathematics is mainly a matter of following fixed and rigid procedures that have no connection to their thinking about realistic and meaningful situations. Instead of seeing mathematics as thoughtful, reflective reasoning, students see it as a matter of parroting procedures, as an academic ritual that has no genuine usefulness. Such ritualistic mathematics, stripped of its power to explain anything that matters and devoid of the interconnections that arise from sense-making, becomes a hodgepodge of memorized—and easily forgotten—rules. The National Research Council dubbed such knowledge “mindless mimicry mathematics.”

**The modern scientific view of mathematics learning.** Almost all current major scientific theories describing how students learn mathematics with genuine understanding (instead of by rote) agree that: (a) mathematical ideas must be mentally constructed by students as they intentionally try to make personal sense of situations; (b) how students construct new ideas is heavily dependent on the cognitive structures students have previously developed; and (c) to be effective, mathematics teaching must carefully guide and support the processes by which students construct mathematical ideas. According to these *constructivist-based* theories, the way a student interprets, thinks about, and makes sense of newly encountered mathematical ideas is determined by the elements and the organization of the relevant mental structures that the student is currently using to process his or her mathematical world. Consequently, instruction that promotes understanding cannot ignore students’ current ideas and ways of

reasoning, including their many informal, and even incorrect, ideas.

However, despite the value of the general notion that students must actively construct their own mathematical knowledge, a careful reading of research in mathematics education reveals that the power and usefulness of these *constructivist* theories arise from: (a) their delineation of specific learning mechanisms, and (b) the detailed research they have spawned on students’ mental construction of meaning for particular mathematical topics such as whole-number operations, fractions, and geometric shapes. It is this elaboration and particularization of the general constructivist theory to specific mathematical topics and classroom situations that make the theory and research genuinely relevant to teaching mathematics.

**The modern view of mathematics teaching.** Both research and professional recommendations suggest a type of mathematics instruction very different from that found in traditional classrooms. In the spirit of inquiry, problem solving, and sense-making, such instruction encourages students to invent, test, and refine their own ideas, rather than unquestioningly follow procedures given to them by others. This type of instruction guides and supports students’ construction of personally meaningful ideas that are increasingly complex, abstract, and powerful, and that evolve into the important formal mathematical ideas of modern culture.

However, unlike instruction that focuses only on classroom inquiry, this type of instruction is based on detailed knowledge of students’ construction of mathematical knowledge and reasoning. That is, this teaching is based on a deep understanding of: (a) the general stages that students pass through in acquiring the concepts and procedures for particular mathematical topics; (b) the strategies that students use to solve different problems at each stage; and (c) the mental processes and the nature of the knowledge that underlies these strategies. This teaching uses carefully selected sequences of problematic tasks to provoke appropriate perturbations and reformulations in students’ thinking.

An abundance of research has shown that mathematics instruction that focuses on student inquiry, problem solving, and personal sense-making—especially that guided by research on students’ construction of meaning for particular topics—produces powerful mathematical thinkers who not

only can compute, but have strong mathematical conceptualizations and are skilled problem solvers.

### Myths and Misunderstandings

**Misunderstanding the nature of mathematics.** One of the most critical aspects of effective mathematics learning is developing a proper understanding of the nature of mathematics. The chairperson of the commission that wrote the National Council of Teachers of Mathematics (NCTM) *Standards* stated, “The single most compelling issue in improving school mathematics is to change the epistemology of mathematics in schools, the sense on the part of teachers and students of what the mathematical enterprise is all about” (Romberg, p. 433).

Mathematics is first and foremost a form of reasoning. In the context of analytically reasoning about particular types of quantitative and spatial phenomena, mathematics consists of thinking in a logical manner, making sense of ideas, formulating and testing conjectures, and justifying claims. One does mathematics when one recognizes and describes patterns; constructs physical or conceptual models of phenomena; creates and uses symbol systems to represent, manipulate, and reflect on ideas; and invents procedures to solve problems. Unfortunately, most students see mathematics as memorizing and following little-understood rules for manipulating symbols.

To illustrate the difference between mathematics as reasoning and mathematics as rule-following, consider the question: “What is  $2\frac{1}{2}$  divided by  $\frac{1}{4}$ ?” Traditionally taught students are trained to solve such problems by using the “invert and multiply” method:  $2\frac{1}{2} \div \frac{1}{4} = \frac{5}{2} \times \frac{4}{1}$ . Students who are lucky enough to recall how to compute an answer can rarely explain or demonstrate why the answer is correct. Worse, most students do not know when the computation should be applied in real-world contexts.

In contrast, students who have made genuine sense of mathematics do not need a symbolic algorithm to compute an answer to this problem. They quickly reason that, since there are 4 fourths in each unit and 2 fourths in a half, there are 10 fourths in  $2\frac{1}{2}$ . Furthermore, such students quickly recognize when to apply such thinking in real-world situations.

Obviously, not all problems can be easily solved using such intuitive strategies. Students must also

develop an understanding of, and facility with, symbolic manipulations. Nevertheless, students’ use of symbols must never become disconnected from their powerful intuitive reasoning about actual quantities. For when it does, students become overwhelmed with trying to memorize countless rules.

**The myth of coverage.** One of the major components of traditional mathematics teaching is the almost universal belief in the myth of *coverage*. According to this myth, if mathematics is “covered” by instruction, students will learn it. This myth is so deeply embedded in traditional mathematics instruction that, at each grade level, teachers feel tremendous pressure to teach huge amounts of material at breakneck speeds. The myth has fostered a curriculum that is superficially broad, and it has encouraged acceleration rather than deep understanding. Belief in this myth causes teachers to criticize as inefficient curricula that emphasize depth of understanding because students in such curricula study far fewer topics at each grade level.

But research on learning debunks this myth. Based on scientific evidence, researchers John Bransford, Ann Brown, and Rodney Cocking explain that covering too many topics too quickly hinders learning because students acquire disorganized and disconnected facts and organizing principles that they cannot make meaningful. Indeed, in his article “Teaching for the Test,” Alan Bell, from the Shell Centre for Mathematical Education at the University of Nottingham, presents research evidence showing the superiority of sense-making curricula. Consistent with Bell’s claim, TIMSS data suggest that Japanese teachers, whose students significantly outperform U.S. students in mathematics, spend much more time than U.S. teachers having students delve deeply into mathematical ideas.

In summary, because students in traditional curricula learn ideas and procedures rotely, rather than meaningfully, they quickly forget them, so the ideas must be repeatedly retaught. In contrast, in curricula that focus on deep understanding and personal sense-making, because students naturally develop and interrelate new and rich conceptualizations, they accumulate an ever-increasing network of well-integrated and long-lasting mathematical knowledge. Thus, curricula that emphasize deep understanding may cover fewer topics at particular grade levels, but overall they enable students to learn more material because topics do not need to be repeatedly taught.

**Putting skill before understanding.** Many people, including teachers, believe that students, especially those in lower-level classes, should master mathematical procedures first, then later try to understand them. However, research indicates that if students have already rote memorized procedures through extensive practice, it is very difficult for later instruction to get them to conceptually understand the procedures. For example, it has been found that fifth and sixth graders who had practiced rules for adding and subtracting decimals by lining up the decimal points were less likely than fourth graders with no such experience to acquire conceptual knowledge from meaning-based instruction.

**Believing that bright students are doing fine.** Although there is general agreement that most students have difficulty becoming genuinely competent with mathematics, many people take solace in the belief that bright students are doing fine. However, a closer look reveals that even the brightest American students are being detrimentally affected by traditional teaching. For instance, a bright eighth grader who was three weeks from completing a standard course in high school geometry applied the volume formula in a situation in which it was inappropriate, getting an incorrect answer:

Observer: How do you know that is the right answer?

Student: Because the equation for the volume of a box is length times width times height.

Observer: Do you know why that equation works?

Student: Because you are covering all three dimensions, I think. I'm not really sure. I just know the equation. (Battista, 1999)

This student did not understand that the mathematical formula she applied assumed a particular mathematical model of a real-world situation, one that was inappropriate for the problem she was presented. Although this bright student had learned many routine mathematical procedures, much of the learning she accomplished in her accelerated mathematics program was superficial, a finding that is all too common among bright students. Indeed, only 38 percent of the students in her geometry class answered the item correctly, despite the fact that all of them had scored at or above the ninety-fifth percentile in mathematics on a widely used standardized mathematics test in fifth grade. Similarly, in the

suburbs of one major American city in which the median family income is 30 percent higher than the national average, and in which three-quarters of the students were found to be at or above the international standard for computation, only between one-fifth and one-third met the international standard for problem solving.

**Misunderstanding inquiry-based teaching.** Many educators and laypersons incorrectly conceive of the inquiry-based instruction suggested by modern research as a pedagogical paradigm entailing nonrigorous, intellectual anarchy that lets students pursue whatever interests them and invent and use any mathematical methods they wish, whether these methods are correct or not. Others see such instruction as equivalent to cooperative learning, teaching with manipulatives, or *discovery* teaching in which a teacher asks a series of questions in an effort to get students to discover a specific, formal mathematical concept. Although elements of the latter three conceptions are, in altered form, similar to components of the type of instruction recommended by research in mathematics education, none of these conceptions is equivalent to the modern view. What separates the new, research-based view of teaching from past views is: (a) the strong focus on, and carefully guided support of, students' construction of personal mathematical meaning, and (b) the use of research on students' learning of particular mathematical topics to guide the selection of instructional tasks, teaching strategies, and learning assessments.

To illustrate, consider the topic of finding the volume of a rectangular box. In traditional didactic teaching, students are simply shown the procedure of multiplying the length, width, and height. In classic discovery teaching, students might be given several boxes and asked to determine the boxes' dimensions and volumes using rulers and small cubes. The teacher would ask students to determine the relationship between the dimensions and the volumes, with the goal being for students to discover the "length times width times height" procedure. In contrast, research-based inquiry teaching might give students a sequence of problems in which students examine a picture of a rectangular array of cubes that fills a box, predict how many cubes are in the array, then make the box and fill it with cubes to check their prediction. The goal would be for each individual student to develop a prediction strategy that not only is correct but also makes sense to the student.

Research shows that the formula rarely makes sense to students, and that, if given appropriate opportunities, students generally develop some type of layering strategy, for instance, counting the cubes showing on the front face of an array and multiplying by the number of layers going back. Because the layering strategy is a natural curtailment of the concrete counting strategies students initially employ on these problems, it is far easier for students to make personal sense of layering than using the formula.

Modern research further guides inquiry teaching by describing the cognitive obstacles students face in learning and the cognitive processes needed to overcome these obstacles. For instance, research indicates that before being exposed to appropriate instruction, most students have an incorrect model of the array of cubes that fills a rectangular box. Because of a lack of coordination and synthesis of spatial information, students can neither picture where all the cubes are nor appropriately mentally organize the cubes. Instruction can support the development of personal meaning for procedures for finding volume only if it ensures that (a) students develop proper mental models of the cube arrays, and (b) students base their enumeration strategies on these mental models.

**Forgetting the need for fluency.** Because of mistaken beliefs about the type of instruction suggested by research and professional recommendations, low-fidelity implementations of reform curricula often focus so much on promoting class discussions and reasoning that they lose sight of the critical need to properly crystallize students' thinking into a sophisticated and fluent use of mathematics. Although modern approaches to instruction have rightly shifted the instructional focus from imitating procedures to understanding and personal sense-making, it is clearly insufficient to involve students only in sense-making, reasoning, and the construction of mathematical knowledge. Sound curricula must also assure that students become fluent in utilizing particularly useful mathematical concepts, ways of reasoning, and procedures. Students should be able to readily and correctly apply important mathematical strategies, procedures, and lines of reasoning in various situations, and they should possess knowledge that supports mathematical reasoning. For instance, students should know the *basic number facts*, because such knowledge is essential for mental computation,

estimation, performance of computational procedures, and problem solving.

### Mysteries and Challenges

**To inquire or not to inquire.** Scientific research and professional standards recommend inquiry-based instruction because such instruction elicits classroom cultures that support students' genuine sense-making, and because such classrooms focus on the development of students' reasoning, not the disconnected rote acquisition of formal, ready-made ideas contained in textbooks. However, the critical ingredient in research-based teaching is the focus on fostering students' construction of personal mathematical meaning. This focus suggests that inquiry-based teaching that does not focus on students' construction of personally meaningful ideas is not completely consistent with research-based suggestions for teaching. It also suggests that demonstrations, and even lectures, might create meaningful learning if students are capable of, and intentionally focus on, personal sense-making and understanding. However, the question of whether, and when, lecture/demonstration—the most common mode of teaching found in American schools—can produce meaningful mathematics learning has not received much research attention. Research is needed that thoroughly investigates the role that this cherished traditional instructional tool can play in meaningful mathematics learning.

**Scientific practice versus tradition.** One of the major reasons that school mathematics programs in the U.S. are so ineffective is because they ignore modern scientific research on mathematics learning and teaching. For instance, many popular approaches to improving mathematics learning focus on getting students to “try harder” or take more rigorous courses. Or, in attempts to increase students' motivation, educators use gimmicks to try to make mathematics classes—but not mathematics itself—more interesting. But almost all of these approaches are rooted in a traditional perspective on mathematics learning; they ignore the cognitive processes that undergird mathematical sense-making. So even when these approaches are “successful,” they produce only mimicry-based procedural knowledge of mathematics.

It is not that increasing motivation and effort are bad ideas. If students are unwilling to engage in intellectual activity in the mathematics classroom, there is little chance that mathematics instruction of

any kind, no matter how sound, will induce or support their mathematics learning. However, students' motivation and effort to learn mathematics are strongly dependent on their beliefs about the value that mathematics, and school in general, has for their lives. The nature of these beliefs is determined partly by students' interaction with family, peers, schools, and community, but also by the quality of their mathematics instruction. Instruction that does not properly support students' mathematical sense-making builds counterproductive beliefs about mathematics learning.

Thus, because instructional approaches that are not based on modern scientific research on the learning process ignore the workings of the very process they are attempting to affect, they cannot support genuine mathematical sense-making or produce productive beliefs about learning mathematics. One of the greatest challenges is to determine how to get teachers, administrators, and policymakers to base their instructional practices and decisions on modern scientific research.

**Assessment.** Because commonly used assessments inadequately measure students' mathematics learning, there is a critical need for the creation and adoption of new assessment methods that more accurately portray student learning. Assessments are needed that not only determine *if* students have acquired particular mathematical knowledge, skills, and types of reasoning, but also determine precisely *what* students have learned. Such assessments must be firmly and explicitly linked to scientific research on students' mathematics learning, something that is sorely missing in traditional assessment paradigms. To be consistent with such research, assessment must focus on students' mathematical cognitions, not their overt behaviors.

MICHAEL T. BATTISTA

## NUMBER SENSE

What does it mean to suggest that an individual possesses good *number sense*? The ability to see patterns and relationships between numbers, to work flexibly with operations and procedures, to recognize order and relative quantities, and to utilize estimation and mental computation are all components of what is termed *number sense*. Individuals who quickly calculate a 15 percent gratuity at a restaurant, know that the seven-digit display 0.498732 is approximately  $1/2$ , or recognize that calculating  $48 \times 12$  will be less problematic than calculating  $48 \times 13$  are said to manifest qualities associated with good number sense.

Most mathematics educators agree that developing number sense is important, yet there is no single definition that is unanimously accepted. Number sense is highly personalized and thought to develop gradually. It includes self-regulation, an ability to make connections in number patterns, and an intuition regarding numbers. Number sense "refers to a person's general understanding of number and operations along with the ability and inclination to use this understanding in flexible ways to make mathematical judgments and to develop useful strategies for handling numbers and operations" (McIntosh et al., p. 3).

## Historical Background

Before the term *number sense* came into use, the word *numeracy* was coined in 1959 to denote those within the realm of mathematics who had a propensity to comprehend higher-level mathematical concepts. Yet the general public took numeracy to be the mathematical analogue of literacy, and therefore reduced its meaning to connote the propensity to comprehend basic arithmetic. A book by John Allen Paulos, *Innumeracy: Mathematical Illiteracy and Its Consequences* (1988), demonstrated the dangers of a population that lacks a basic understanding of mathematics and that views the subject as enigmatic due to poor education or psychological anxiety. Many of those involved with mathematics education felt that math pedagogy was in need of serious reform due to a superficial acquisition of knowledge based merely on a procedural understanding of mathematics (e.g., “just follow this algorithm”).

In the late 1980s and the 1990s researchers and educators saw a heightened need to examine the role of computation as it related to elementary mathematics, reflecting on both the process and result of employing algorithmic strategies. It was during this period that the term *number sense* gained wide acceptance, epitomizing the desired outcome for the teaching and learning of mathematics. Yet due to its implicit nature, succinctly describing how number sense is revealed can be problematic. The mathematician Stanislas Dehaene, in his 1997 book *The Number Sense: How the Mind Creates Mathematics*, states, “Our number sense cannot be reduced to the formal definition provided by rules or axioms” (p. 240). In addition, James Greeno relates, “We recognize examples of number sense, even though we have no satisfactory definition that distinguishes its features” (p. 171).

Similar to the ambiguous implications of common sense, number sense is open to a variety of interpretations. The National Council of Teachers of Mathematics, in *Curriculum and Evaluation of Standards for School Mathematics* (1989), defines number sense as “an intuition about numbers that is drawn from all the varied meanings of number. It has five components: (1) having well-understood number meanings, (2) developing multiple relationships among numbers, (3) understanding the relative magnitudes of numbers, (4) developing intuitions about the relative effect of operating on numbers, (5) developing referents for measures of common objects” (pp. 39–40). However, others would argue

that such descriptors and boundaries for the nature of number sense do not characterize it in forms that guide instruction. Lauren Resnick and Judith Sowder categorize number sense as an open-ended form of reasoning that is nonalgorithmic, complex, and involves uncertainty. These multiple views are highlighted merely to show the somewhat amorphous nature of number sense and qualities ascribed to it.

## Examples of Number Sense

Most often, number sense is recognized through example. One ascribed attribute is the ability to use numbers flexibly when mentally computing an abstract numerical operation. This flexibility evolves through infixing connections and relationships between numbers and their representations. By augmenting the number of connections to analogous situations, more flexibility and utility ensues. For example, a simple computation involving subtraction is the problem  $7 - 4$ . The ability to place this abstraction of symbols into multiple situations signifies a certain number sense, such as: (1) a set or group—seven cookies take away four cookies; (2) a distance—in order to move from space 4 to space 7 in a board game, 3 moves are required; (3) a temperature reading—to change from  $7^{\circ}\text{C}$  to  $4^{\circ}\text{C}$ , the temperature must drop  $3^{\circ}\text{C}$ . These mental models seem natural to most adults and children who have been guided to think with such models. With the simple transition of this problem, reversing the minuend and subtrahend mandates an ability to move into negative numbers:  $4 - 7$  equals what? For a child who has only the group mental model (4 cookies take away 7 cookies), this operation seems problematic or impossible. A child who has multiple models can utilize the one that gives a more intuitive representation of the abstract operation—if the temperature is  $4^{\circ}\text{C}$  and then falls  $7^{\circ}\text{C}$ , then the new temperature would be negative (or minus)  $3^{\circ}\text{C}$ .

In addition, being able to compare the relative size of numbers would be a sign of number sense. Students should recognize that 4,562 is large compared to 400 but small compared to 400,000. There should also be emphasis placed on providing context to compare large numbers. For example, a million and a billion are ubiquitous quantities in many economies. Therefore, to recognize that it takes roughly eleven-and-a-half days for a million seconds to pass and nearly thirty-two years for a billion seconds to pass connotes a deeper appreciation for the relative magnitude of quantities.

Number sense extends beyond the set of whole numbers and integers. Consider a more frequent area of concern for many school children, fractions. Consider the following example:  $\frac{2}{3} + \frac{1}{4}$ . For conceptual understanding, fractions and ratios necessitate the skill of proportional reasoning in order to make sense of this abstract representation. Considering a part-to-a-whole relationship, the adroit student can recognize the necessity to compare equal size parts (and therefore find a common denominator) before total parts can be computed:

$$\frac{2}{3} + \frac{1}{4} = \frac{8}{12} + \frac{3}{12} = \frac{11}{12}$$

In contrast, a child who has no intuitive grasp for fractions will most likely commit the error of adding the numerators and adding the denominators. This algorithmic error might also be attributed to those who rely on a strictly procedural understanding, because this procedure is correct when it relates to multiplying fractions,

$$\left( \frac{2}{3} \times \frac{1}{4} \text{ does equal } \frac{2 \times 1}{3 \times 4} = \frac{2}{12} \text{ or } \frac{1}{6} \right)$$

and students often confuse these two rules. Furthermore, this nonconventional result for addition can be justified with concrete examples. If Barry Bonds plays in both games of a double-header, and he bats 2 for 3 in the first game and 1 for 4 in the second game, then his correct batting average for the day is 3 for 7, which, in terms of the traditional procedure for adding fractions, is not conventionally correct:

$$\frac{2}{3} + \frac{1}{4} = \frac{2+1}{3+4} = \frac{3}{7} \text{ or } \approx 0.429$$

Therefore, number sense involves knowing *when* a specific model is applicable.

Sometimes, number sense can be grasped intuitively through visual clues as well. Some people have an affinity for understanding visual models, which they might then internalize and incorporate into their personal number sense. Figure 1 contains no symbolic representation of numerals; rather, actual quantities are depicted as the objects themselves. The question at hand is to compare the available cake for girls and for boys and determine in which of the two groups does an individual receive more cake. Students who are versed in strictly procedural understandings might set up ratios that symbolize

the situation, then try to rely on memorized algorithms to simplify the symbols:

$$\begin{aligned} & \frac{3}{8} \text{ compared with } \frac{1}{3} \\ & \text{assume equality } \therefore \frac{3}{8} = \frac{1}{3} \\ & \text{cross multiply } \rightarrow \frac{3}{8} = \frac{1}{3} = 3 \cdot 3 = 8 \cdot 1 \\ & \therefore 9 > 8 \text{ so } \frac{3}{8} > \frac{1}{3} \end{aligned}$$

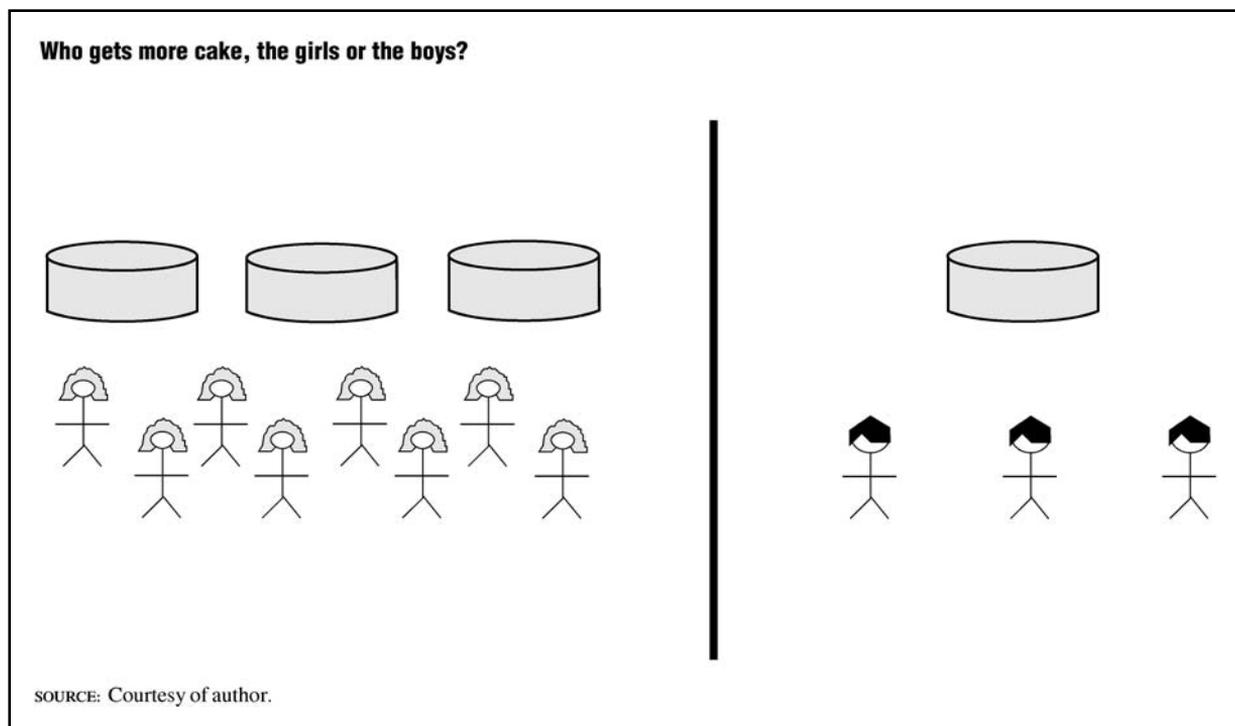

Someone with a more flexible understanding might simply notice that for the boys there is one cake for a group of three; therefore, an equal ratio based on three cakes would be a group of nine girls. From this equivalency, they would deduce that since there are less than nine girls, then each girl must receive more cake than each boy.

### Developing Number Sense

The acquisition of number sense is often considered to develop as stages along a continuum, rather than as a static object that is either possessed or not. Dehaene reports that most children enter preschool with a well-developed understanding of approximation and counting. Dehaene presents research from cognitive psychologists, such as Jean Piaget, Prentice Starkey, and Karen Wynn, suggesting contradictory results about what skills are innate, when skills are developed, and how they are acquired. Part of the complexity to succinctly describe a development of number sense stems both from the subtlety of multiple factors it encompasses and the lack of explicit demonstrability. For example, with the problem  $18 \times 5$ , someone demonstrating number sense might recognize the relationship of the quantity 5 compared to 10 is simply half, and knowing that, taking half of this result would give the desired result, 90. This sophisticated innovation may be entirely internal, with only the final solution given and no account of the process. Although we can recognize number sense when we see it, the question as to how one's cognitive process completes individual tasks is less certain. It is similar to mathematicians' demands for valid proofs to be *rigorous*, though they are unable to adequately describe what is meant by *rigor*.

There are several factors regarding the development of number sense that mathematics educators have come to agree upon from empirical research during the 1990s. Results from Paul Cobb et al., Judith Sowder, Sharon Griffin and Robbie Case, and

FIGURE 1

Eddie Gray and David Tall have provided a more clearly agreed upon framework regarding advantageous skills for building number sense. Sowder notes that computational estimation and mental computation are important links to building number sense. Both Cobb et al. and Greeno state that both the use of mental models and creating a conceptual environment are necessary facilitators to make these links. Educators see a necessity to incorporate rich examples that guide students toward conceptual understandings, instead of superficial procedures that are not considered malleable. Developing mental models and utilizing mental computation are increasingly considered vital skills in mathematics; however research about reasoning with mental models is in a preliminary state.

### Current Trends and Their Effects on Mathematics Education

The twentieth century saw its share of reforms in mathematics pedagogy—from the algorithmic framework of connectionist theory attributed to Edward L. Thorndike to the axiomatic formalization of modern mathematics pursued by Bourbaki (a pseudonym taken by a group of French mathematicians) and Piaget's constructivist theory, which dominated the second half of the century and em-

phasized individuals as constructing their own knowledge through a process of abstraction, generalization, and concept formation. The concern in the 1990s surrounding a superficial (or merely procedural) understanding of mathematics with a lack of conceptual understanding was the catalyst that galvanized a push toward interpreting mathematics not as rote and memorization, but as problem solving, intuitive reasoning, and pattern recognition. The concept of number sense sprang forth from these shifts in philosophy regarding mathematics education. With this shift, a question arises: What significance does number sense have on mathematics education and pedagogy?

Another difficulty in encapsulating pedagogy that develops number sense stems from the fact that most mathematicians fail to recognize their own number sense and how they employ it. Their ability to move beyond procedures and definitions into the realm of concepts is rarely a conscious process. To a mathematician, the act is incorporated into their thinking process such that its nature becomes an involuntary action, like blinking or breathing. The mathematical paradox of striving for efficiency, both in notation and procedures, can oftentimes add to a lack of understanding for the student. To commu-

nicate efficiently, all those involved must be fluent in the language of mathematics.

Obviously, some students are successful in mathematics regardless of the pedagogical approach used. If this were not the case, the explosion within the new fields of mathematics that occurred after 1950 would not have occurred. Philip Davis and Reuben Hersh attest that more than half of all of mathematics was discovered after World War II. The question, then, is what percentage of those who completed traditional education were finding this success. Gray and Tall speculate that only 30 percent of students were able to develop an intuitive grasp of mathematics and higher-order thinking with previous pedagogies. So what about the other 70 percent? The research by Paul Cobb et al., Sharon Griffin and Robbie Case, and others consider this a central focus of current pedagogical issues.

This search for conceptual understanding seems to be the focus of research and pedagogy in the beginning of the twenty-first century. Empirical evidence supports a curriculum that stresses practical, intuitive, and rich real-world examples within mathematics. The Rightstart project, developed by Case and Griffin in 1997, is one such example. Their research focused on children living in urban, low-income communities who were lagging behind their peers in terms of age-level mathematics abilities. After participating in forty twenty-minute sessions that incorporated numerical games and concrete materials (using thermometers, board games, and number lines) these children were propelled to the top of their class, and they maintained this placement over a longitudinal study lasting several years. This success was achieved by focusing on two main goals: (1) to help students to develop a set of symbolic states and operations that are intimately tied to real-world quantities, and (2) to develop students' explicit knowledge of notational systems in conjunction with their implicit and intuitive knowledge, thus ensuring that these two types of knowledge act as natural companions to each other. Both of these goals coincide with the parameters of developing number sense.

The mathematician Warren McCulloch (1965) once observed, "What is a number, that a man may know it, and a man, that he may know a number?" The answer to this question, which has been posed in various forms since antiquity, changes with the understanding of mathematics. Since the 1990s, mathematics educators have been researching how

number sense ameliorates students' understanding of mathematics. Mathematics educators have embraced this shift toward a pedagogy that strives to merge intuition, formal notation, and conceptual understanding. Number sense helps students eschew the notion that mathematics is merely a collection of rules to memorize. Number sense fosters students' ability to make judgments about the reasonableness of solutions and to build on their intuitions and insights. Number sense helps convince students that mathematics makes sense.

## NUMERACY AND CULTURE

In simple terms, *numeracy* can be defined as the ability to understand basic mathematical concepts and operations. Numeracy thus encompasses a wide range of topics, including formal symbolic mathematics, cultural practices, children's intuitions about mathematics, and everyday behaviors mediated by mathematics. There are different forms of numeracy,

and their realization in various cultural contexts has commonly been called *ethnomathematics*. Researchers have explored how pedagogy can be changed to incorporate cultural practices related to numeracy.

### Numeracy in Cultural Context

All cultures have developed various representational systems that provide ways of thinking about quantitative information. Different systems highlight different aspects of knowing. For example, the Oksapmin of Papua New Guinea have a counting system that uses body parts to express numbers from one to twenty-seven. Though no base is used in this system, it is adequate when trading goods using a one-to-one correspondence. It is inadequate, however, for computing or counting objects beyond twenty-seven. A contrasting example is the enumeration system of many Asian languages that is congruent to the structure of base ten. Asian children using this system tend to recite more number names in correct sequence and show earlier mastery of place-value concepts (i.e., relations among number words, multi-digit numerals, and quantities) than children using less regular base-ten systems.

In addition to enumeration systems, cultures have developed representational systems for locating (geometry, navigation), measuring, designing (form, shape, pattern), playing (rules, strategies), and explaining (abstraction). These representational systems entail beliefs and values associated with numeracy, and they support numeracy activities using tools such as abaci, clocks, and digital computers. A broad array of human activities to which mathematical thinking is applied is thus interwoven with cultural artifacts, social conventions, and social interactions.

Cultural variations in mathematical behavior are also seen in the ways people use mathematical representations in their everyday activities. For example, children working as street vendors in Brazil were found to use different computational strategies when selling than when doing school-like problems. While selling they used such strategies as oral computation, decomposition, and repeated groupings, whereas when given school-like problems they used standard algorithms. These children were found to be much more accurate in the context of selling than in the school setting. Research in other domains, such as measurement and proportional reasoning, further confirms that informal mathematics can be

effective and does not depend upon schooling for its development.

Mathematics is used in everyday life in pursuit of goals that differ from the goals of academic mathematics found in schools and universities. This type of mathematics is often referred to as *informal*, or *naive*, mathematics. Representational systems and practices deriving from everyday activities are modified as new goals emerge. Thus, everyday mathematics is an adaptive system that can be used to creatively meet new challenges. For example, as the Oksapmin became more involved with the currency system, their body counting system described earlier began to change toward a base system. Although knowledge acquired through informal experiences are often distinguished from school mathematics, skills developed in the informal domain can be used to address goals and practices in the school setting. For example, the most successful elementary students in Liberian schools combine the strategies from their indigenous mathematics with school algorithms. Use of informal mathematics in school settings, therefore, may be an effective way to help children learn school mathematics. Several authors have argued for building bridges between informal and formal mathematics.

Although most research on numeracy and culture has been done outside of the United States, understanding informal and everyday mathematics is important for educators in the United States for a number of reasons. According to the census conducted in October 1999, about 2.5 million foreign-born children came to U.S. schools, bringing with them different mathematics representational systems and associated computational skills. In addition, everyday mathematical activities and language repertoires for American children of different ethnic groups have been shown to differ both across groups and when compared to the school curriculum. In the case of some groups, such as Native Americans, mathematical reasoning derived from cultural traditions is distinct from that of the schools, posing major conceptual problems for these children in the regular school curriculum.

### Research on Curricular Change

A number of projects have attempted to make mathematics instruction more culturally relevant for groups of children who have traditionally underachieved in the U.S. school system. Mary Brenner has worked with teachers to improve mathematics

teaching for Native Hawaiian children. She interviewed parents and children and observed children in everyday settings to determine what kinds of numerical skills children brought with them to school. At the kindergarten level, adapting the existing curriculum consisted of reordering topics to begin with counting and computation (areas of student strength), more use of the students' nonstandard dialect in mathematics lessons, and more emphasis upon hands-on and game-like activities. At the higher grade levels, adaptations focused more on including activities, such as a school store, that enabled students to move from informal mathematical activities to more standard mathematical practices.

Ethnographic research has revealed many mathematically rich activities in everyday adult life. Luis Moll and James Greenberg have developed a culturally relevant pedagogy for Latino students by building classroom activities from the "funds of knowledge" that are present in their family networks. Teachers and researchers worked together to plan lessons based upon ethnographic data, and they also invited parents to teach. New mathematics units, such as one involving candy making, were developed as the contexts for teaching specific mathematical ideas.

In a different approach, Jerry Lipka and Ester Ilutsik, who work with the Yup'ik people in Alaska, advocate giving the community control over the process of curriculum development. The goal is to make the schools a local institution, rather than having schools act as representatives of the dominant society. Researchers, Yup'ik teachers, and tribal elders have worked together to translate Yup'ik mathematical knowledge into a form that can be utilized in classrooms. Like the Funds of Knowledge project, this group has analyzed everyday adult activities, such as fish camps, to understand the culturally relevant mathematics. In addition, they have worked to better understand the Yup'ik number system and how it can be used in the classroom. The goal is to create an entire mathematics curriculum based upon Yup'ik culture, rather than adapting existing curricula.

Gloria Ladson-Billings has conducted research on culturally relevant mathematics instruction for African-American children. This research has highlighted a variety of attitudinal changes that teachers must make in their teaching, including expecting higher academic standards for students, emphasizing

ing cultural competence, and instilling critical consciousness in students.

### Teaching and Cultural Context

Teaching is an inherently cultural activity; it is situated in a bed of routines, traditions, beliefs, expectations, and values of students, teachers, administrators, parents, and the public. Thus, the inclusion of cultural and everyday mathematical knowledge in school mathematics must take into account the school-based assumptions about the appropriate way to teach mathematics.

For example, cultural assumptions about effective ways to improve teaching in Japan include life-long professional development activities carried out by ordinary teachers. Typically, a few teachers with similar goals and interests form a study group. They select a few lessons that need improvement and analyze what is and is not working in the current practice in terms of learning goals for students, students' misunderstandings, and use of activity. They gather information on the topics by reading about other teachers' ideas, as well as other sources of recommended practices. A revised lesson is then planned, and one of the teachers from the group implements it while the others observe and evaluate what is and is not working. This process of evaluation, planning, and implementation is repeated until a satisfactory lesson is crafted, and may consume an entire school year. This is in sharp contrast to the type of model lesson developed by expert teachers and handed down to ordinary teachers in the United States. This is also different from the "one-day, make-it-and-take-it" type professional development workshops often implemented in the United States—a practice whose long-term effectiveness is questionable.

### Ideas for Teachers

The importance of raising awareness of cultural diversity among teachers has been extended to the teaching of mathematics in the United States. For example, in the mid-1990s a task force for the National Council of Teachers of Mathematics recommended the publication of a series, *Changing the Faces of Mathematics*, in order to help make the slogans of *Mathematics for All* and *Everybody Counts* real. Particular efforts were made to focus on education of ethnic and cultural minority students. Included in this series are volumes on African-American perspectives, Latino perspectives, and Asian-American and Pacific Islander perspectives.

Each of these volumes includes articles that discuss successful pedagogical strategies for culturally diverse groups of students. The volumes also feature articles that may help educators develop a deeper understanding of the cultural differences that influence classroom dynamics, behavior, and environment.

## WORD-PROBLEM SOLVING

A *word problem* is a verbal description of a problem situation wherein one or more questions are posed, the answers to which can be obtained by the application of mathematical operations to information (usually numerical data) available in the text. In its most typical form, a word problem describes the essentials of some situation assumed to be familiar to the solver. Within the text, certain quantities are explicitly given, while others are not. The student is required to give a numerical answer to a stated question by making exclusive use of the quantities given—and of the mathematical relationships between these quantities. Simple examples include: “Pete wins 3 marbles in a game and now has 8 marbles. How many marbles did he have before the game?” and “One kilogram of coffee costs 12 euros. Susan buys 0.75 kilogram of coffee. How much does she have to pay?”

Despite its label, a word problem need not constitute a *problem* in the cognitive-psychological sense of the word—higher-order thinking going beyond the application of a familiar routine procedure is not necessarily required. Indeed, in typical elementary mathematics instruction, many word problems provide thinly disguised practice in adding, subtracting, multiplying, or dividing.

### Structural Dimensions of Word Problems

Several structural dimensions can be distinguished in word problems that affect their difficulty and how they are solved:

- *Mathematical structure*, which includes the nature of the given and unknown quantities of the problem, and the mathematical operations by which the unknowns can be derived from the givens.
- *Semantic structure*, which includes the ways in which an interpretation of the text points to

particular mathematical relationships. For example, addition or subtraction is indicated when the text implies a combination of disjoint subsets into a superset, a change from an initial quantity to a subsequent quantity by addition or subtraction, or the additive comparison between two collections.

- *Context*, meaning the nature of the situation described. For example, an additive problem involving combination of disjoint sets might deal with physically combining collections of objects or with conceptually combining collections of people in two locations.
- *The format*, meaning how the problem is formulated and presented. Format involves such factors as the placement of the question, the complexity of the lexical and grammatical structures, the presence of superfluous information, and so on.

Over several decades, numerous studies have analyzed the role of these task variables on the difficulty of problems, on the kind of strategies students use to solve these problems, and on the nature of their errors, particularly for simple word problems involving addition and subtraction or multiplication and division.

### Roles of Word Problems

Why does school mathematics include word problems? Perhaps simply because they are there, and have been for many centuries. Indeed, their role in mathematics education dates back to antiquity; the oldest known being in Egyptian papyri dating from 2000 B.C.E., with strikingly similar examples in ancient Chinese and Indian manuscripts. The following example is from the first printed mathematical textbook, a Treviso arithmetic of 1478: “If 17 men build 2 houses in 9 days, how many days will it take 20 men to build 5 houses?”

Despite this striking continuity across time and cultures, until recently there was little explicit discussion of why word problems should be such a prominent part of the curriculum, or of the variety of purposes behind their inclusion. Some have a puzzle-like nature and act as “mental manipulatives” (Toom, p. 36) to guide thinking within mathematical structures. Such problems are intended to train students to think creatively and develop problem-solving abilities. By contrast, the type mainly used educationally consists of a text representing (at

least putatively) a real-world situation in which the derived answer would “work.” Ostensible goals for the use of this type include offering practice for the situations of everyday life in which the mathematics learned will be needed, thereby showing students that the mathematics they are learning will be useful.

### Apparent Suspension of Sense-Making

In recent years, the characteristics, use, and rationale of word problems have been critically analyzed from multiple perspectives, including linguistic, cultural, and sociological perspectives. In particular, it has been argued by many mathematics educators that the stereotyped and artificial nature of word problems typically represented in mathematics textbooks, and the discourse and activity around these problems in traditional mathematics lessons, have detrimental effects. Many observations have led to the conclusion that children answer word problems without taking into account realistic considerations about the situations described in the text, or even whether the question and the answer make sense. The most dramatic example comes from French researchers who posed children nonsensical questions such as: “There are 26 sheep and 10 goats on a ship. How old is the captain?” It was found that the majority of students were prepared to offer an answer to such questions. In another study, thirteen-year-old students in the United States were asked the following question: “An army bus holds 36 soldiers. If 1,128 soldiers are being bussed to their training site, how many buses are needed?” The division was correctly computed by 70 percent of the students to get a quotient of 31 and remainder 12—but only 23 percent gave the appropriate answer, “32 buses.” Nineteen percent gave the answer as “31 buses” and 29 percent gave the answer as “31, remainder 12.”

To explain the abundant observations of this “suspension of sense-making” when doing word problems, it has been suggested by Erik De Corte and Lieven Verschaffel that the practice surrounding word problems is controlled by a set of (largely implicit) rules that constitute the “word-problem game.” These rules including the following assumptions: (1) every problem presented by the teacher or in a textbook is solvable and makes sense; (2) there is only one exact numerical correct answer to every word problem; and (3) the answer must be obtained by performing basic arithmetical operations on all numbers stated in the problem.

### Reconceptualizing Word Problems as Modeling Exercises

One reaction to criticisms of traditional practice surrounding word problems in schools is to undermine the approach that allows students to succeed using superficial strategies based on the “rules.” This is done by breaking up the stereotypical nature of the problems posed. For example, by including problems that do not make sense or contain superfluous or insufficient data, students can be guided to interpret word problems critically.

A more radical suggestion is to treat word problems as exercises in mathematical modeling. The application of mathematics to solve problem situations in the real world, termed *mathematical modeling*, is a complex process involving several phases, including understanding the situation described; constructing a mathematical model that describes the essence of the relevant elements embedded in the situation; working through the mathematical model to identify what follows from it; interpreting the computational work to arrive at a solution to the problem; evaluating that interpreted outcome in relation to the original situation; and communicating the interpreted results.

This schema can be used to describe the process of solving mathematical word problems as application problems. In the simplest cases, situations may be directly modeled by addition, subtraction, multiplication, or division, and children need to learn the variety of prototypical situations that fit unproblematically onto these operations. In other cases, the modeling is not so straightforward if serious attention is given to the reality of the situation described. In the example from the Treviso arithmetic, attention would be drawn to the assumptions that underpin an answer based on direct proportionality—and to the fact that the answer thus derived would at best provide a rough approximation in the real situation. In the bus problem, the “raw” result of the computation has to be appropriately refined in the context of the situation described.

### Reforming the Teaching of Word Problems

In line with the above criticisms and recommendations with respect to the traditional practice surrounding word problems in schools, researchers have set up design studies to develop, implement, and evaluate experimental programs aimed at the enhancement of strategies and attitudes about solv-

ing mathematical word problems. In these studies, positive outcomes have been obtained in terms of both outcomes (test scores) and underlying processes (beliefs, strategies, attitudes). Characteristics common to such experimental programs include:

- The use of more realistic and challenging tasks than traditional textbook problems.
- A variety of teaching methods and learner activities, including expert modeling of the strategic aspects of the competent solution process, small-group work, and whole-class discussions.
- The creation of a classroom climate that is conducive to the development in pupils of an elaborated view of mathematical modeling, and of the accompanying beliefs and attitudes.

To some extent, these characteristics of a new approach to word-problem solving are beginning to be implemented in mathematical frameworks, curricula, textbooks, and tests in many countries. Much remains to be done, however, to align the teaching of word problems with widely accepted principles that children should make connections between mathematics and their lived experience—and that mathematics should make sense to them.

## MAYS, BENJAMIN (1895–1984)

Benjamin Elijah Mays was born to former slaves Hezekiah and Louvenia (Carter) Mays in Epworth, Greenwood County, South Carolina. The youngest of eight children, he became a theologian, theoretician, orator, author, college president, civil rights activist, and school board president. Casting himself as a "rebel," he greatly influenced the country and the world with his ideals and activities.

### The Formative Years

The 1890s was an especially difficult period for blacks as whites in the South were angry in the aftermath of Reconstruction: lynchings and violence were common. Born on an isolated cotton farm, Mays's earliest recollections were of the Phoenix Riots in Greenwood County during November 1898 in which several black people were lynched. He wrote in his autobiography, "That mob is my earliest memory" (p. 1). Mays's intellectual prowess became known in church and school. He, however, attended the Brickhouse School only from November to February as he was needed to help his sharecropping family bring in the harvest. In 1911 he abandoned the farm to enroll in the High School Department of South Carolina State College, graduating as valedictorian at age twenty-one in 1916.

Following one year of study at Virginia Union University, Mays tired of the bitter racial climate in the South, and gained admission to Bates College in Lewiston, Maine. He worked as a Pullman porter before winning scholarships. Encouraged by the relatively liberal racial climate of New England, Mays flourished. He graduated from Bates with honors in 1920 and became committed to a life of teaching and learning. After one year of sampling assorted graduate courses at the University of Chicago, Mays taught psychology, math, and religion at Morehouse College in Atlanta from 1921 to 1923. While in Atlanta, he was ordained a Baptist minister in 1922. He returned to the University of Chicago's School of Religion and completed a master's degree in New Testament Studies in 1925.

Mays returned to teach English at South Carolina State College for a year. Hoping to make a difference in the lives of deprived black people, he then moved, with his new wife Sadie Gray, to the Urban League in Tampa, Florida for two years. Working with his wife, a case worker, his title at the Urban League was executive secretary of the Family Service

## MATHEMATICS, TEACHING OF

See: MATHEMATICS EDUCATION, *subentry on* TEACHER PREPARATION; MATHEMATICS LEARNING.

Association. After two years, he accepted a position as student secretary of the YMCA in Atlanta, where he hoped to once again influence the larger community.

In 1930, the Institute of Social and Religious Research, funded by the Rockefeller family, embarked on the most ambitious study to date on the black church and its influence on the African-American population. Mays and Joseph W. Nicholson, a minister in the Colored Methodist Episcopal (CME) Church, conducted a fourteen-month study of 691 churches in 12 large cities. That study would establish Mays as an important scholar and “rebel” theoretician.

### Early Religious Scholarship

The result of the Mays/Nicholson collaboration was published in 1933 as the iconoclastic work *The Negro's Church*, which was premised upon the church's importance at the center of black culture and social life. The authors argued that the church belonged to the Negro and provided a place of refuge, expression, democracy, fellowship, and freedom surrounded by the lack of all those things elsewhere. They spoke of the “genius” of the black church. Mays (and Nicholson), however, also found that it possessed significant constraints.

Throughout the work, the authors explored sensitive and rarely addressed issues such as denominational rivalry, misplaced ministerial ambition, poor theological training, irrelevant sermon content, unnecessary emotionalism, appeals to fear, and finally the “overchurching” of the Negro. The provocative work concluded that “analysis reveals that the status of the Negro church is in part the result of the failure of American Christianity in the realm of race-relation” (p. 278).

This critique, followed by a companion book, *The Negro's God: As Reflected in His Literature* (1938), catapulted Mays to a new level of scholarship.

### The Howard Years

In 1932 Mays had returned to the University of Chicago to complete his doctorate in three years. One year before completing the doctorate, Mordecai Johnson, the respected president of Howard University in Washington, D.C., persuaded Mays to assume the deanship at Howard's School of Religion. From 1934 to 1940 Mays worked to elevate that depart-

ment to one of national prominence. Increased enrollment, enriched curriculum, a better-credentialed faculty, higher revenues, and improvements to the physical plant and library gained the department a Class “A” rating from the American Association of Theological Schools and national attention for Mays.

During the Howard years, Mays traveled widely, expanding his network of colleagues and friends, working to strengthen other black colleges, and most importantly developing his version of a liberation theology. Mid-1930s visits to Europe, China, North Africa, the Middle East, Asia, and the Indian subcontinent provided Mays with a startling look at poverty, hatred, oppression, racism, and caste. His personal audience with Mahatma Gandhi, whom he already admired, reinforced his belief in nonviolence as an “active force” for social change. Mays emerged from these experiences as one of the most influential black men in the South. In early 1940, banker and Morehouse trustee John Wheeler was dispatched by the Board of Trustees to recruit Mays for the presidency of the school. Reluctant to leave Howard, Mays spent months seeking the advice of leading educators. With the blessing of Mordecai Johnson he became president of Morehouse on August 1, 1940.

### Morehouse College

Benjamin Mays became the sixth president of Morehouse College, which would be his home base for the next twenty-seven years. A man of great faith and vision, Mays was also politically astute. He understood that the plight of black people had always been at the center of the social, political, economic, and cultural life of the South and the nation. He sensed that Morehouse College could and would play an important role in the lives of black America, and ultimately the country. Although its student body was relatively small and resources meager, the school was situated in an important place at an important time.

By 1940 Morehouse College was well established among the nation's historically black colleges. The notion of an intellectually capable “Morehouse Man” was emergent. Morale problems had, however, surfaced as the school was seen by students and alumni as falling behind the other black colleges of Atlanta. Between 1930 and 1940 the faculty at Atlanta University increased by 220 percent and the faculty at Spelman increased by 78 percent, while Morehouse's faculty had decreased by 16 percent. Morehouse students were taught by Atlanta University and Spelman faculty. In addition, uncollected

tuition and a feeble endowment inhibited expansion.

As president, Mays immediately began exhorting alumni to increase contributions. Secondly, he appealed for contributions from philanthropic foundations and friends of the college. Most importantly, he began aggressively collecting the considerable tuition arrears from students. Students were not allowed to register for classes, obtain transcripts, or graduate until debts were cleared. Those efforts earned Mays the nickname “Buck Benny” around the campus. His obsession with quality faculty, previously noted during his years at Howard, quickly became evident at Morehouse.

He searched widely for faculty with doctorates. Despite social and residential problems in rigidly segregated Atlanta, white professors were welcomed by Mays. Where high-quality professors could not be hired, Mays offered existing faculty financial support to seek higher degrees.

During Mays’s presidency, the campus land area increased from 10.7 to 20.2 acres. New buildings included five small dormitories housing 115 men, a large dormitory housing 120 men, a physical educational and health building, an infirmary, a dining hall, a small academic building, a meditation chapel, a dormitory for students enrolled in the Morehouse School of Religion, a music studio, and three faculty apartments.

### The Morehouse Mentor

Beyond those accomplishments, Benjamin Mays is far better known for his spiritual guidance and intellectual leadership. Reared in an environment of hatred, Mays could talk of uplift because he lived it. The testimony of former students and public figures such as Martin Luther King Jr., Julian Bond, Lerone Bennett and many others suggests that his students listened to his exhortations.

Leadership and the pursuit of further education became watchwords at Morehouse. Its students became distinguished by their accomplishments after graduation. By the mid-1960s more than half the school’s graduates had entered graduate or professional schools; of its graduates, 118 had earned Ph.D.s, and by 1967, more than 300 Morehouse graduates earned M.D. and D.D.S. degrees. By that time Morehouse graduates held teaching or administrative positions at 58 black and 22 white institutions of higher learning. Twenty-one institutions of

higher learning had Morehouse graduates as president. Between 1945 and 1967 Morehouse ranked second among Georgia institutions in the production of Woodrow Wilson Fellows. Mays’s figures also reveal a large number of Morehouse graduates occupying high administrative positions in school districts scattered around the country.

Mays was particularly proud of the School of Religion, where he invested significant personal attention. Several of its graduates, including Martin Luther King Jr., Howard Thurman, Dillard H. Brown, Thomas Kilgore, and George Kelsey, have been singled out for high honors and distinction.

With great pride, Mays identified the group of Morehouse graduates who occupied high profile positions in the world of politics, law, and business. Widely known scholars and writers such as Lerone Bennett Jr., James Birnie, Benjamin Brawley, Michael Lomax, and Ira Reid inspired Mays to petition for the establishment a Phi Beta Kappa chapter at the college which was granted in 1967.

No discussion of Mays at Morehouse would be complete without mention of chapel. Chapel was a longstanding tradition at Morehouse, where students were required to attend every day except Saturday. Mays used chapel to build community and expand learning outside the classroom. Martin Luther King Jr. recalled chapel and Mays’ motivational talks as among his most inspirational college experiences.

### Philosopher and Liberation Theologian

Mays developed a religious philosophy of morality, justice, and humanity rooted in the quest for freedom. While the term *liberation theology* perhaps belongs to a later time period, it is nevertheless applicable to Mays’s views.

Beyond an individual morality, Mays reflected on the wider role of the black church in the lives of its people, concluding that the church must go beyond providing comfort, freedom of expression, and socializing. It must engage a social consciousness offering visions of freedom, empowerment, and equality. It must go beyond the personal and into the political.

Stephen Preskill (1996) sees Mays’ views as the ideological antecedent of the liberatory views of Cornel West, a contemporary African-American scholar-activist and social critic. He examines three propositions advanced by West: (1) human discern-

ment, or understanding the present from a social analysis of the past, more specifically understanding how to practice democracy in a racist society; (2) human connection, embracing the lived concrete realities of oppressed people; and (3) human hypocrisy, exposing the contradictions between deeds and words. In all cases Preskill traces West's three propositions to Mays' affirmation of the common people's right to make change.

Mays's nascent liberation theology is outlined in his little-known work *The Negro's God: As Reflected in His Literature* (1938). In this study Mays explores portrayals of God in a wide variety of biblical, classical, political, and sociological literature. He identifies salient themes recurring in the literature, arguing that these themes resonate with and contribute to the prevailing culture of African Americans. Mays clusters and describes Negro views about God into three categories: traditional biblical themes; justice and equality; and social change.

Mays retired from Morehouse in 1967. By then the modern civil rights movement was well under way. Mays remained a quiet mentor, staying in touch and offering advice to his former students who were leading the movement. Additionally, he sat on many committees and commissions, including the Ford Foundation and the Department of Health, Education, and Welfare, advising presidents, governors, and policymakers on civil rights matters.

Upon the assassination of Dr. Martin Luther King, Mays concluded his eulogy for his former student and long-standing friend by saying, "If physical death was the price he had to pay to rid America of prejudice and injustice, nothing could be more redemptive."

His last great task was to serve the city he always saw as crucial in American race relations. He joined the Atlanta School Board of Education, becoming its first black president, from 1969 through 1981. In his last years, Mays continued to advise leaders from politics and business on matters of race. He served as an adviser to President Jimmy Carter, and received forty-three honorary degrees (including honorary doctorates from Harvard and Brandeis), the Dorie Miller Medal of Honor, and the Older Citizen Award.

WILLIAM H. WATKINS

## MCCALL, WILLIAM A. (1891–1982)

Professor of educational psychology, William Anderson McCall was an expert in the construction of tests and measurements to evaluate student learning and achievement. Born in Wellsville, Tennessee, McCall received his early education in a one-room schoolhouse, near Red Ash, Kentucky. Reared in a family of limited means, he spent up to half of each calendar year, from the time he was nine years old through his teenage years, working as a coal digger in the mines in Red Ash and neighboring Jellico, Tennessee. Encouraged by local educators who recognized his intellectual abilities, McCall continued his education at Cumberland College in Kentucky, where he received an A.B. degree in 1911, and at Lincoln Memorial University, in Tennessee, where he taught psychology and earned a second undergraduate degree in 1913. In the same year he enrolled at Teachers College, Columbia University, where he earned a Ph.D. in 1916, under the reputed behavioral psychologist, Edward L. Thorndike.

McCall began his graduate studies at Teachers College at the height of the Progressive educational reform movement, which began in the 1890s and

stretched into the early decades of the twentieth century. No other university-affiliated school of education rivaled Teachers College in terms of its influence in shaping the Progressive educational agenda, which among other objectives aimed to establish a scientific basis for the study and practice of education and to ensure greater order, accountability, and economy in school management. Over the course of his forty-year professorship at Teachers College, Thorndike generated in collaboration with his students—McCall counting prominently among them—a body of quantitative knowledge in the field of mental measurements that was a central, supporting element of these overlapping goals.

Standard measures of educational objectives and statistical analyses of learning and achievement favored by Thorndike and his students formed the basis, among other new administrative practices, for the homogenous grouping of students by intellectual ability and became cornerstones of the efficiently managed schools that educational reformers envisioned.

As McCall remembered, he first attracted the attention and respect of Thorndike, who he grew to revere, based on the proficiency he demonstrated, in his first year at Teachers College, at navigating a series of mazes with which Thorndike challenged a class of students. By any measure, McCall's professional career advanced quickly at Teachers College. In the same year he completed his doctoral studies, he was appointed an instructor in elementary education and published the results of experimental work he conducted with Thorndike, measuring the relationship between different conditions of air ventilation and mental functioning. In 1919 he was appointed an assistant professor of elementary education, and in 1927 he became professor of measurement, research, and statistics.

In the intervening years, McCall published two of his most noteworthy books, *How to Measure in Education* and *How to Experiment in Education*. Both volumes, which are in effect practical guides for educators to the field of mental measurements, address the need for precise means of quantifying student intelligence and for experimental projects to test the validity of educational theory and the effectiveness of classroom practice. Building on Thorndike's well-known maxim that "whatever exists at all, exists in some amount" (p. 16), McCall reasons in *How to Measure* that "there is never a quantity that does not measure some existing quality, and never an existing

quality that is non-quantitative" (1923a, p. 4). In response to contemporary educational critics, who framed educational questions in philosophical and qualitative terms, or who otherwise questioned the true limits of quantification, McCall insists that "all the abilities and virtues for which education is consciously striving can be measured and be measured better than they ever have been. The measurement of initiative, judgment of relative values, leadership, appreciation of good literature and the like," he asserts, "is entirely possible" (1923b, p. 4).

In keeping with his view of educational reform, McCall wrote extensively over the course of his career about the technical aspects of constructing, implementing, scaling, and scoring tests to evaluate intellectual competency and achievement. In addition, he was the author or coauthor of numerous tests and courses of instruction in the fields of reading, arithmetic and spelling, including the *Thorndike-McCall Reading Scale*, the *Multi-Mental Scale*, the *McCall Speller*, *Woody-McCall Mixed Fundamentals in Arithmetic Language*, and *McCall-Crabbs Standard Test Lessons in Reading*.

McCall's expertise in mental measurements was not limited to the reform of American education. On leave from Teachers College, McCall spent the 1922–1923 academic year in China, where he served as director of psychological research for the Chinese National Association for the Advancement of Education. The enrollment of Chinese students at Teachers College, beginning in 1910, paved the way during a period of educational modernization in China for intellectual exchange between Teachers College faculty and leading Chinese educators. McCall traveled to China, following visits there by Paul Monroe, who was a professor of history and education, and the philosopher John Dewey, who taught courses in education at Teachers College. Eager to encourage the scientific study of education in China, McCall worked diligently, overseeing the construction of educational tests and measurements and their use in Chinese schools nationwide. He was firmly committed to realizing the same objectives in China that shaped his work to improve education in the United States. In a 1923 report, *Scientific Measurement and Related Studies in Chinese Education*, which outlines his work in China, McCall notes that "to test all things and hold fast that which is good is as prerequisite to progress in education as it has been to the correction of our practical philosophy,

or the improvement of every form of life upon the earth" (1923b, p. 19).

Although McCall had hoped to spend an additional year in China to further the work he had begun, his request for another leave of absence was denied by Teachers College. He resumed his teaching duties there until 1927, when he contracted tuberculosis and was forced to abandon his professional responsibilities to convalesce. He returned to Teachers College sometime around 1930. He never fully recovered from his illness though and left active duty with the faculty in 1941. He moved with his wife, Gretchen Schweizer McCall, to the Smoky Mountains in North Carolina. McCall continued to be active professionally, revising and constructing new tests and courses of reading instruction, and consulting on various educational projects. In 1952 he published the results of a study, *Measurement of Teacher Merit*, that he conducted for the North Carolina State Education Commission, which measured the effectiveness of classroom teachers in relationship to pupil progress and growth. In 1975 he published *I Think Me a Thaut*, a compilation of the diary entries he wrote in Appalachian dialect, beginning when he was eight years old, about his boyhood. McCall eventually made his home in Coral Gables, Florida, where he died.

BETTE WENECK

### MCMURRY, CHARLES (1857–1929)

The principal disseminator of Herbartian pedagogical ideas in the United States, Charles Alexander McMurry formulated the concept of interdisciplinary curriculum. He grew up in rural Illinois and took the classical high school course in the training school of the Illinois State Normal University (ISNU), followed by two years of classical study at the University of Michigan. He then taught in Illinois country schools for two years and in Colorado for two years. He returned to Illinois and in 1882 was persuaded by a colleague to go to Halle, Germany, to study Christian theology. Through conversations with Charles DeGarmo, he became interested in the pedagogical ideas being disseminated by the German Herbartians, who believed that the development of moral character in the elementary school was achieved by a structured academic curriculum. McMurry returned to Halle in 1886, accompanied by his younger brother Frank, who was also interested in finding a theoretical grounding for teaching. After completing his Ph.D. in 1887, Charles joined his brother in the newly established Herbartian pedagogical seminar of Professor Wilhelm Rein at the University of Jena. There, teacher preparation and practice teaching were carried out according to a full interpretation of Herbartian psychology and pedagogy. It was this experience with the integration of theory and practice that led the brothers to launch American Herbartianism in the 1890s.

Convinced of the potential value of the Herbartian approach for American teachers, by the time McMurry arrived home in 1888 he had a complete ten-year writing plan to bring those ideas to teachers, and he began testing them in practice as a principal in Evanston, Illinois, and then as head of the training school at the Winona State Normal School in Minnesota in 1889. He and Frank published a translation from Wilhelm Rein's work as *The Method of the Recitation* in 1890. In 1892 Charles published *The Elements of General Method Based on the Principles of Herbart*, the same year that he returned to Illinois to become assistant in the training school

at ISNU. He soon became its director and over the next seven years produced the first volumes in his series of special methods books that carried Herbartian ideas into normal schools all over the country. In spring of 1892 the McMurry brothers and Charles DeGarmo spearheaded the formation of a National Herbart Club, modeled on the German *Verein der wissenschaftliche Pädagogik*, which disseminated Herbartian ideas through local discussion clubs.

Through the interest of such national figures as Francis W. Parker, the Herbartian notion of correlated curriculum gained sufficient attention to prompt calls in the National Education Association's Committee of Ten report for more correlation, and the establishment of a special subcommittee to report on the efficacy of correlation as a guiding principle for elementary school curriculum. That 1895 report, written by U.S. Commissioner of Education William Torrey Harris, in effect ignored the Herbartian notion, provoking vociferous objections and prompting the McMurrays, DeGarmo, and others to found and publicize the National Herbart Society for the Scientific Study of Education (NHS) in 1895 as a forum for open discussion of new educational ideas. McMurry served as its secretary and yearbook editor for eight years, carrying it through its transition to the National Society for the Study of Education (NSSE) in 1902 and actively recruiting members for local clubs. Harris's resistance to Herbartianism on philosophical grounds was overridden; most educators believed in the pedagogical utility of Herbartian ideas and in particular by the semiscientific nature of their expression. McMurry disseminated Herbartianism through book production and through summer school teaching at the universities of Minnesota, Chicago, Illinois, Columbia, and Cornell, and through his work as secretary of both the NHS and the Illinois Society for Child Study.

In 1899 McMurry established the teacher education program at the new Northern Illinois State Normal School at DeKalb along Herbartian lines. In 1906 to 1907 he served as acting president of the California State Normal School of Pennsylvania. He returned to DeKalb to begin a process of integrating the city schools into the teacher education program, becoming superintendent in 1911. During this period he wrote extensively, revising his special methods books in history, geography, literature, arithmetic, natural science, and language, and reworked his translation and adaptation of the Herbartian eight-year course of study. He gave particular emphasis to

the development of "type studies," units that examined a "typical" phenomenon (such as a forest community) in depth in order to develop a thorough understanding of principles that could then be applied to the study of other phenomena. In 1915 he became professor of elementary education at the newly reorganized Peabody College of Education at Vanderbilt University. He died in 1929, remembered by his colleagues and students as a master teacher at all levels.

## MEDIA AND LEARNING

Educators have examined the impact of media on learning since at least 1912, when the American psychologist Edward L. Thorndike recommended pictures as a labor saving device for instruction. Five questions about media and learning will be briefly examined. The first section will define media and summarize the results of research on learning from media, the relative cost of media use, and the impact of media on access to education. The second section

describes new research on the economic benefits of instructional media, including suggestions for “cognitive efficiency” studies. The third section presents new information about learning problems caused by poor design of instructional media “displays.” The fourth part will examine claims that new media enhance student’s motivation to learn. The final section will describe work on technology integration that focuses on learning how to solve problems.

### Definitions and Summary of Research

*Media* are generally defined as the means by which information is conveyed from one place to another. In the past century, various forms of media have been used to convey instruction and to support learning. Examples of instructional media include traditional means of delivering instruction (chalkboards, textbooks, overhead projectors, and teachers), mass media used for education (newspapers, movies, radio, and television), and the newer “electronic” instructional media (computers, interactive video, and multimedia systems). All instruction requires the selection and use of at least one medium to deliver instruction. Many alternative media and mixtures of media may be chosen for any given learning goal and group of students. Thus, research questions have compared the learning benefits of various media and mixes of media for different types of learning goals and students at different ages and aptitude levels. Thousands of studies have been and continue to be conducted.

**Do some media produce more learning than others?** In his 2001 book *Learning from Media*, Richard E. Clark concluded that there are no learning benefits from any specific medium or mix of media. He summarized the research on this issue in an analogy that is often repeated: “The best . . . evidence is that media are mere vehicles that deliver instruction but do not influence student achievement any more than the truck that delivers our groceries causes changes in our nutrition. Basically, the choice of vehicle might influence the cost or extent of distributing instruction, but only the content of the vehicle can influence achievement” (p. 13). While some media will not convey certain types of information necessary for learning (for example, newspapers cannot transmit sound or “real-time” visual events), any necessary information can be conveyed by a number of media (sound and visual events can be conveyed by many media other than newspapers). A more positive way to state this conclusion is that educators

can expect similar levels of learning from a great variety of media provided that essential instructional methods are used. When more than one medium can provide the instructional method needed for learning, the choice of medium is based on expected economic benefits such as the per-student cost of instruction, not learning benefits. An alternative view was expressed in 1994 by Robert B. Kozma, who contended that media and method should not be separated.

**Media and method.** The key issue here is that when media are used for instruction, they may often be confused with the instructional methods and information they convey. For example, computer-based instruction is often thought to be highly “interactive” because computers permit high levels of exchange between student and computer-delivered instructional programs. Yet most media permit interaction, although some media do so more quickly and economically.

Any medium seems to be able to increase learning provided that the information content and instructional methods they convey are adequate to support student learning. The existing research suggests that when learning is influenced by external events, those events must support the use of mental processes that are required for learning goals by students who are unable or unwilling to provide them for themselves. The specification for these external events is what Clark called an “instructional method.” Instances of common instructional methods are learning plans, examples, and practice exercises with interactive, corrective feedback. Since a variety of media will present any of the common instructional methods required to learn, the benefits of media are not in their impact on learning but instead in their economic impact and their capacity to increase access to educational information and instructional programs.

### Do Media Influence the Cost and Access to Instruction?

It appears that media can significantly influence the cost of learning and the ease and cost of access to instruction by students. Determining the per-student cost of instruction and access to information requires careful analysis. In 2000 Brenda Sugrue and Clark reviewed the research and practice in media selection and cost analysis. They described different methods of performing cost analysis prior to selecting media for instruction or training.

**Cognitive efficiencies from media.** A twist in the discussion about the economic benefits of media came from a suggestion made by Thomas Cobb in a 1997 article. He argued that some media and symbol systems lead to quicker and/or less demanding learning results than other media or symbolic modes for some students. Cobb's suggestion opens an area of research where there are at least two possibilities: First, any medium or representational mode used for presenting an instructional method (for instance, an example presented in either pictorial or verbal modes) might help some individuals to learn easier and/or faster (for instance, high visual but low verbal ability learners may learn faster from pictures than from narrative descriptions of examples). Second, the cost of learning is, after all, one of the most important issues for those concerned with the application of research to solving practical problems. The expectation that currently guides research in this area could be stated as: Whenever a given instructional method is necessary for learning, different media or symbolic modes will have different learning efficiencies for learners with different aptitudes.

**Visual and aural learning aids.** Compelling examples of possible cognitive efficiencies can be found in several studies, including a 1995 study by Samuel Mousavi and colleagues, and a 1997 study by Richard E. Mayer. These researchers provided evidence that presenting novel and difficult science concepts to learners in both auditory and visual symbolic modes results in more efficient (quicker, easier) learning than information presented in either mode alone for high visual ability and low prior knowledge learners. The researchers' explanation for their findings is that the conscious human mind is supported by both auditory and visual "buffers" that specialize in storing different symbolic representations of information to be learned. These buffers permit instructional information to be stored in both visual and aural (sound) forms. Conscious consideration of information to be learned or used in problem solving can be held in the mind only briefly (approximately six to eight seconds) unless the person repeats it or elaborates it somehow. Imagine a person who is trying to remember a new telephone number someone gave them verbally as they walk a long distance to find a telephone. Unless the person repeats the information or writes it down, he or she will tend to forget it before reaching the telephone. Giving information content in two different modalities (visual and auditory) apparently results in storage by two

different, sensory-based memory buffers, which increases the duration and quality of information available to learners while they mentally process the information. Thus, providing key instructional information in both pictorial and auditory (narrative) forms might extend the duration of "thinking time" during learning for some learners. It is critical to note that in their 2000 article Roxana Moreno and Mayer limited this "learning efficiency" impact of both visual and aural modes of instruction to a small group of learners. The increased efficiency was primarily useful for students who had a very low prior knowledge and very high visual ability. One might wonder what percentage of students received a significantly enhanced efficiency from both visual and aural forms of instruction.

### Media Display Problems

There is increasing evidence that the "busy" screen designs that are typical in computer-based and multimedia learning environments often cause learning problems. Many media designers are tempted toward instructional presentations that include active animated figures, music, sounds, and other visually and aurally exciting displays. While most people welcome the visual and aural entertainment, the best evidence suggests that learners are often overloaded by these "seductive details" and their learning is reduced. Screen designs that separate visual and text-based explanations or demonstrations, and/or are heavily text laden, seem to damage learning because they overload a person's thinking while she is trying to learn. Mayer and his students recommend the spatial (visual) and temporal (time) integration of verbal and visual information. They also recommend the use of narration rather than large bodies of text. This line of research provides important guidance for screen design. It strongly indicates that instructional designers and teachers must focus learners constantly on learning goals and resist the temptation to offer enticing and aesthetically pleasing but irrelevant formats and features.

### Do Some Media Motivate Learning More than Other Media?

While many advocates of new forms of instructional media have argued for motivational benefits, existing evidence suggests that important components of motivation may actually be decreased by common features of, for example, computer or multimedia instruction. In a 1984 article Gavriel Salomon pres-

ented evidence that students who express strong preferences for any medium or mix of media tend to expect that it will be a less demanding way to learn. This expectation results in the investment of lower levels of mental effort and lower achievement levels when compared to instructional conditions that are perceived as more demanding. Yet, it is likely that other motivational benefits might exist with newer media. For example, students may be more enthusiastic about enrolling in instruction presented by newer media because of optimistic expectations about ease of access and flexibility of scheduling. Delays in finishing online courses and rumors about high “drop-out” rates suggest the need for more research on whether students persist in courses offered using new media.

Not much is known about the direct impact of new media on mental effort (aside from Salomon’s cautions), but the early research is not promising. Some studies indicate that many instructional strategies and complex screen displays risk overloading working memory and causing “automated” cognitive defaults where mental effort is both reduced and directed to nonlearning goals. Educators are thus faced with an ironic contradiction where students are attracted to media qualities that are known to reduce their learning. Complicating this finding is strong evidence that learners are not aware when they become overloaded by too much visual and/or verbal information.

### Technology Integration

This discussion of media has thus far focused on media as a delivery device. Educators have typically viewed media in two ways. First, media are viewed as a means to amplify the teacher’s message, such as with the use of an overhead projector or a video projector. Second, media are viewed as a way to deliver instruction using computer-based instruction or television. For example, Alfred Bork suggested that computer-based instruction would revolutionize schools and change the way students would learn. Yet, by the beginning of the twenty-first century the computer-based instruction revolution had yet to materialize.

Subsequent efforts shifted attention away from using computers to deliver instruction through a tutorial or drill-and-practice instructional method toward using computers as a tool that is integrated into other classroom activities to facilitate problem solving and learning. In their 2002 book *Integrating*

*Computer Technology into the Classroom*, Gary R. Morrison and Deborah L. Lowther described technology integration as the process of using application software (for example, spreadsheets, databases, and web browsers) as tools to help students learn problem solving. An example of technology integration is the NteQ (Integrating Technology for Inquiry) model. This model provides teachers with a ten-step approach for developing problem-based instructional units that integrate technology. Students use computers to gather, manipulate, and present information related to solving academic problems. The emphasis at this level is on the use of the computer as a tool in the same way that scientists and business professionals use computers in their work.

This shift in focus from using computers and other media to deliver instruction to one of using computers as an integrated problem-solving tool places a greater emphasis on the development of media-based instructional methods. The emphasis of the research also shifts from comparing two media conditions (e.g., classrooms with and without computers) to one of investigating the effectiveness of the media-based instructional strategies employed in the classroom. An extensive description of a classroom-based example of technology integration can be found in an online article from 2000, written by Steven M. Ross, Morrison, Lowther, and Robert T. Plants, that investigated a school district’s pilot of an Anytime Anywhere Learning project focused on writing achievement. Teachers in the pilot project, where the students had laptop computers, were more likely to use problem-based learning, cooperative learning, facilitation, and sustained writing than teachers in traditional classrooms. Similarly, students in the pilot project had significantly higher scores on a writing sample collected at the end of the year. These differences were attributed to the student-centered environment created by the teachers rather than the computer technology.

## MEDIA, INFLUENCE ON CHILDREN

According to the American Academy of Pediatrics (AAP), "Children are influenced by media—they learn by observing, imitating, and making behaviors their own" (2001, p.1224). The influence of media on children has been the subject of increased attention among parents, educators, and health care professionals. The significance of this issue becomes obvious when one notes the diversity of Americans who share this concern. Included in this group of concerned citizens are those, most notably politicians, who typically stand in opposition to one another on many issues, but who stand together in agreement on this one.

Media influence on children has steadily increased as new and more sophisticated types of media have been developed and made available to the American public. Availability, as well as greater affordability for American families, has provided easier access to media for children. Beneficial effects include early readiness for learning, educational enrichment, opportunities to view or participate in discussions of social issues, exposure to the arts through music and performance, and entertainment. Harmful effects may result from sensationalization of violent behavior, exposure to subtle or explicit sexual content, promotion of unrealistic body images, presentation of poor health habits as desirable practices, and exposure to persuasive advertising targeting children.

In the following discussion, some attention will be given to the beneficial effects of media on children, but the primary focus will be on negative influences, which have been more widely researched.

### History of Media for Children

The twentieth century was a time of phenomenal growth and development of new kinds of media. In the early twentieth century, film, radio, and newspapers were the media forms to which children had access, though limited. Beginning in the early 1940s and continuing through the end of the century, children's media experiences expanded to include television, recorded music, videotapes, electronic games, interactive computer software, and the Internet. Print media, such as comic books and children's magazines, also expanded during this period, though not at the same accelerated rate as the visual electronic media.

Commercial television made its debut in 1941, initiating a new era of media influence. One of the earliest documented examples of the effect of advertising in the media was the introduction in 1952 of television ads for Mr. Potato Head, a toy manufactured by Hasbro. Gross sales were more than \$4 million in its first year of television advertising. At that time, more than two-thirds of television sets were owned by families with children under twelve years of age.

Educational programming, offered primarily on public television stations, was the next milestone in television's early influences on children. In the larger discussion of media influence on children, educational programming is without question the source of the most significant and long-lasting positive effects.

A pioneer in educational programming was the Children's Television Workshop, founded in 1968 by Joan Ganz Cooney, Lloyd Morrisett, Gerald Lesser, and others. The creation of a television production company dedicated to children's educational programming was a result of Cooney's study of television for preschool children for the Carnegie Corporation of New York. The project that evolved was a research-based collaboration by educators, psychologists, child development experts, writers and musicians. *Sesame Street* was the first program produced, making its televised debut in 1969. *Sesame Street* was designed to combine education with entertainment and to target children of preschool age.

The development of *Sesame Street* was research-driven to ensure that the most effective strategies for early learning through media were employed. Other children's programs subsequently developed by the Children's Television Workshop included *3-2-1 Contact*, *The Best of Families*, *The Electric Company*, and *Feeling Good*. Programming produced by the Children's Television Workshop was innovative, was well received by the public, and became a model for other programs, both in the media and as in school settings, for providing effective early learning experiences to prepare young children to enter school. The positive influence of the Children's Television Workshop on American children was widespread.

During the 1980s and 1990s, unprecedented growth occurred in the field of computer technology, resulting in the increased availability of computers to children, both in their homes and schools. Improved access for children resulted in expanded media influence on children, with a new interactive element that was not previously seen in media.

During this same period, media content underwent a transformation that was characterized by increased use of sexual themes and violent behavior. This change was evident in movies, television programming, music lyrics, video games, cartoons, and magazines. There was an outcry from parents and concerned adults who objected to children's exposure to content that was age inappropriate and who were troubled by the probable negative effects of such exposure. In an attempt to inform adults who were monitoring children's media exposure, ratings systems were developed that identified content categories and frequency or intensity of specific incidents. Rating codes were used to label movies, television programs, and music lyrics. Although rating systems served their purpose of informing the public, it is questionable to what extent children were actually affected by their implementation.

### General Considerations

There are two important factors that must be included in the discussion of media influence on children. One factor, called *media literacy*, was addressed by Renee Hobbs. Hobbs contended that:

Just because our students can use media and technology doesn't mean they are effective at critically analyzing and evaluating the messages they receive. Students need a set of skills to ask important questions

about what they watch, see, listen to and read. Often called media literacy, these skills include the ability to critically analyze media messages and the ability to use different kinds of communication technologies for self-expression and communication.

A child who is media illiterate is more vulnerable to being influenced by messages in all kinds of media.

The second factor that can affect how children are influenced by media is the amount of parental involvement in supervising media exposure of children. The U.S. Department of Education's Office of Educational Research and Improvement published guidelines in 1994 that said:

Parental monitoring is a key factor, since the research studies show that increasing guidance from parents is at least as important as simply reducing media violence. Children may learn negative behavior patterns and values from many other experiences as well as TV programs, and parental guidance is needed to help children sort out these influences and develop the ability to make sound decisions on their own.

An important media literacy skill, which can be developed through parental guidance, is a child's ability to distinguish between reality and fantasy in media messages. Children may not be capable of making this distinction without an adult's help, resulting in a child's confused perception of fantasy as reality. But with proper adult guidance, they can learn to critique what they view and become more discriminating consumers of media.

### **Studies of Media Influence**

Media violence and its effects on children was the first area in which extensive scientific research was done. In 1972 the Office of the Surgeon General conducted studies on media violence and its effects on children who viewed it. The conclusions of these studies were confirmed and extended by studies performed at the National Institute of Mental Health in 1982. Three years later, the American Psychological Association (APA) published a report that reaffirmed the previous studies. A landmark report of media influence on children was published by the AAP in 1999. The study was done by the Committee on Public Education, and presented in their policy statement of August 1999. In July 2000, at a Congressional Public Health Summit, the AAP, the

American Medical Association, the American Academy of Child and Adolescent Psychiatry, and the APA issued an unprecedented "Joint Statement on the Impact of Entertainment Violence on Children." Speaking for members of the national public-health community, the statement presented a consensus opinion on the effects of violence in the media on children. The joint statement, however, included an interesting and important distinction that addressed the context of violence in the media, stating: "It is not violence itself but the context in which it is portrayed that can make the difference between learning about violence and learning to be violent." With the important caveat in mind, the overwhelming consensus of the aforementioned studies was that there is substantial evidence that exposure to violence in the media has harmful effects on children and has been linked to children's aggressive behavior.

Violence in interactive media forms (Internet, computer and video games) as opposed to passive media forms (television, movies, videos) may have even stronger effects on children and, as a result, has become a focus of new research. According to the Office of the Surgeon General, "children are theoretically more susceptible to behavioral influences when they are active participants than when they are observers." To further legitimize these concerns, the AAP reported that initial studies of interactive media show that the element of child-initiated virtual violence may result in even more significant effects than those of passive media. Because research has already shown that passive media violence has significant influence on children, the implications of increased effects from interactive media are troublesome.

Despite the research reports, there was debate between television broadcasters and scientists regarding the harmful effects of television violence on children. Broadcasters asserted that there was not enough evidence to link viewing television violence to children's aggressive behavior. Scientists, nevertheless, stood by their research findings.

### **Domains of Influence**

Research studies have identified the following domains of influence in which media content has been shown to have negative effects on children: violence and aggressive behavior, sexual content, body image and self-esteem, and physical health and school performance. Information on media violence has been taken from the following primary sources: the 2002 APA study titled "Violence on Television" and the

1999 and 2001 policy statements of the Committee on Public Education of the AAP. The 2001 policy statement is recommended as a comprehensive source of information on the topic of media violence. Other studies were referenced for information on sexual content, body image, and health issues.

**Violence and aggressive behavior.** The question of violence in the media and its influence on children is probably the most widely researched domain of media influence. Studies over a span of three decades, beginning in the early 1970s, have shown that significant exposure to media violence increases the risk of aggressive behavior in certain children and adolescents. Other effects on children include desensitization to others' pain and suffering and the tendency to be fearful of the world around them, viewing it as a dangerous place. Research has also shown that news reports of violent crimes can traumatize young children.

**Sexual content.** Increased attention has been given to the second domain, sexual content in the media. The sexualization of American media has become the focus of widespread discussion and criticism by children's advocates. According to studies commissioned by the Kaiser Family Foundation collectively labeled "Sex, Kids, and the Family Hour," there was a 400 percent increase from 1976 to 1996 in sexual references during the evening television viewing time period commonly referred to as "family hour." It was determined that by 1996 children were exposed to about eight sexual references per hour during this time slot. In *Media, Children, and the Family*, Jennings Bryant and Steven Rockwell reported the results of their studies that investigated the effects of exposure to sexual content on television. They found that such exposure affected adolescents' moral judgment. They qualified the results, however, by saying that parental discussion and clear expression of personal values mitigated the effects on adolescents.

**Body image and self-esteem.** The third domain, body image and self-esteem, is widely affected by advertising in the media. Researchers have suggested that media may influence the development of self-esteem in adolescents through messages about body image. Television, movies, magazines, and advertisements present images that promote unrealistic expectations of beauty, body weight, and acceptable physical appearance. Efforts to sell an image that adheres to certain standards of body weight and size may be a catalyst for eating disorders suffered by some adolescents. And, when adolescents fall short

of their own expectations based on media images, self-esteem can suffer. Media theorists and researchers have determined that the effects of this trend are being seen in both boys and girls, with negative psychological affects. Advertisement of appealing, but often financially unaffordable, clothing and promotion of negative gender stereotypes are other areas of concern. Further research on the connections among media messages, body image, and self-esteem is warranted.

**Physical health and school performance.** The fourth domain involves the amount of time that children spend engaged with media activities. The average American child or adolescent spends more than twenty hours per week viewing television. Additional time is often spent watching movies, listening to music, watching music videos, playing video or computer games, or spending computer time on the Internet. This increase in time spent by children using media for recreation has been shown to be a significant factor in childhood obesity due to associated physical inactivity. School achievement may also be affected as a result of decreased time spent on homework or school assignments. And parents often unintentionally contribute to this negative influence by using the television as a way to occupy their children's attention—as a babysitter of sorts. Educators have expressed concerns that the passive nature of media exposure undermines the ability of students to be active learners. Conversely, there have been concerns that overstimulation due to excessive media use might be related to attention deficit disorder or hyperactivity. There has been no research to date that indicates a clear relationship.

Increasingly, tobacco, alcohol, and illicit drugs have been glamorized in the media. Tobacco manufacturers spend \$6 billion per year and alcohol manufacturers \$2 billion per year in advertising that appeals to children. Movies and television programs often show the lead character or likeable characters using and enjoying tobacco and alcohol products. On the other hand, media also provide factual information and venues for discussion, typically through public service announcements or through public programming, informing children and warning them of the dangers of addictions to these substances. These educational messages, however, are on a much smaller scale and are much less appealing in their presentation.

## Recommendations

The AAP, the Office of the Surgeon General, and the APA have offered recommendations to address the issues of media influence on children. Included in these recommendations are suggestions for parents, educators, and health care professionals to advocate for a safer media environment for children through media literacy. They urge media producers to be more responsible in their portrayal of violence. They advocate for more useful and effective media ratings.

A consistent recommendation in studies, however, is proactive parental involvement in children's media experiences. By monitoring what children hear and see, discussing issues that emerge, and sharing media time with their children, parents can moderate the negative influences as well as increase the positive effects of media in the lives of their children.

## MEDICAL COLLEGE ADMISSION TEST (MCAT)

---

The Medical College Admission Test (MCAT) is the standardized test required of all applicants to allopathic (M.D.), osteopathic (D.O.), and podiatric medical schools. It is also accepted as an option for some veterinary and allied health schools. The MCAT tests the mastery of basic biology, chemistry, and physics concepts, problem solving requiring the integration of these disciplines, critical thinking, and writing skills. The test consists of four sections. The Verbal Reasoning section contains multiple-choice questions based on reading selections drawn from a multitude of sources, many outside of the sciences. The intent of this section is to test reading comprehension, evaluation of ideas, analysis of data, and the application of new information. The Physical Sciences section contains multiple-choice questions involving basic knowledge in physics and general chemistry as well as the ability to apply that knowledge and interpret new information. The Writing Sample requires two brief essays written in response to a brief topic statement and assesses the presentation and development of an idea as well as the technical writing skills of the writer. The Biological Sciences section involves multiple-choice questions about basic concepts in biology and organic chemistry as well as the application of that knowledge and interpretation of new information.

The MCAT is a five and three-quarters hour test and is offered in April and August of each year. The Verbal Reasoning, Physical Science, and Biological Science scores are reported on a scale from 1 (low) to 15 (high). The Writing Sample is reported on a scale from *J* (low) to *T* (high), representing the sum of the two essay scores. Although there is no limit to the number of times the test may be taken, special permission must be obtained after the third time. Registration for the MCAT is done online by accessing the website of Association of American Medical Colleges (AAMC). Five practice tests have been released by the AAMC.

The MCAT plays a substantial role in the medical school admissions process. How much emphasis is placed on MCAT scores varies from school to school. Other factors that are considered include: grades (overall and science), the interview, letters of recommendation, research, activities, experience in medicine, application essays, and state of residence. The two most important factors, however, are grades

and MCAT scores. High grades and test scores, though, will not guarantee acceptance. If an applicant with strong grade and test credentials has poor interpersonal skills, poor references, or no experience in medicine, gaining acceptance is very unlikely. On the other hand, a very personable individual with a great deal of medical experience is very unlikely to gain acceptance if MCAT scores or grades are low. It may be useful to think of MCAT scores and grades as threshold criteria. Once the threshold is reached, the other factors become more significant. It is important to note that scores in individual sections of the MCAT may be considered as important as the overall score. For example, an applicant with 10s in each section of the test would probably be considered more favorably than an applicant with scores of 12, 12, and 6. Both total scores are 30, but the former shows consistency and the latter indicates one rather weak area.

The MCAT scores are required for several reasons. First, they validate an applicant's grades. They help the medical school admissions committee compare applicants from many different schools of varying rigor. MCAT scores are particularly useful when considering an applicant from a school that is not well known to the admissions committee. A second reason for the reliance on MCAT scores is that they are predictive of an applicant's success in the academic course work generally taken during the first two years of medical school. Finally, MCAT scores are evidence of an applicant's test-taking ability. This is relevant because successful applicants will face at least three additional major standardized tests that must be passed before they can obtain a license to practice medicine.

Work is underway in 2002 to revise and update the MCAT, although it is likely to be several years before any changes are actually made. One thing is certain, though: the MCAT will continue to play an important role in evaluating applicants for medical school.

## **MEDICAL EDUCATION**

---

The path to a career in medicine in the United States is well defined. Aspiring physicians must earn an undergraduate degree, complete four years of medical school, participate in a minimum of three years of graduate medical training, and pass three national examinations for licensure. Becoming a physician also demands a desire to work with people; intellectual, emotional, and physical stamina; and an ability to think critically to solve complex problems.

Preparation for one of the world's most highly respected careers often starts in high school by taking courses in biology, chemistry, and physics. Preparation continues during college, with particular attention to the courses needed for admission to medical school. Although the specific number of credits required for admission to medical school varies, the minimum college course requirements include one year of biology, two years of chemistry (one year of general/inorganic chemistry and one year of organic chemistry), and one year of physics, all with adequate laboratory experiences. Medical schools may require or strongly recommend taking mathematics and computer science courses in college, though only a small number demand a specific sequence of mathematics courses. Candidates for admission to medical schools are also expected to have a solid background in English, the humanities, and the social sciences.

There is an expectation that aspiring physicians will participate in health-oriented research and in volunteer activities to demonstrate their commitment to the profession. These types of extracurricular activities provide opportunities to explore one's motivations, specific interests, and aptitude for a career in medicine.

Typically, the process of applying to medical school begins during the junior year of undergraduate study. One of the first steps is to take the Medical College Admission Test (MCAT) in the spring of the junior year. The MCAT is a standardized test designed to measure knowledge in the biological and

physical sciences, the ability to read and interpret information, and communication skills. Students indicate which medical schools they want to receive their MCAT scores.

The American Medical College Application Service (AMCAS) facilitates applying to medical school by centralizing the submission of information and supporting materials. Of the 125 medical schools in the United States, 114 participate in AMCAS. Students submit one set of application materials and one official transcript to AMCAS, which in turn distributes the information to participating institutions as designated by the applicant. Deadlines for receiving applications are determined by the individual medical schools. Applications to non-AMCAS medical schools are submitted directly to those institutions in accordance with their individual requirements and deadlines.

Admission committees, composed of faculty members from the basic and clinical sciences departments, screen and prioritize the applications. Academic ability and personal qualities are used to discern applicants' qualifications for medical school. Academic ability is measured in terms of grades on undergraduate courses (with emphasis on the required science courses) and MCAT scores. College grades and MCAT scores are considered the most important predictors of medical school performance during the first two years. Most students admitted to medical school have above average (3.0 and higher) undergraduate grade point averages. An undergraduate major in the sciences is not a mandatory requirement for admission to medical school. Most admission committees look for well-rounded individuals and strive to admit a diversified class. The importance of MCAT scores to admission decisions varies by institution.

Admission committees also look for evidence of maturity, self-discipline, commitment to helping others, and leadership qualities. Candidates' personal statements, letters of evaluation, and the breadth and variety of extracurricular activities in health-related settings are used as indicators of personal attributes. Many medical schools have specific programs for recruiting and enrolling minority students to help increase the number of underrepresented minorities who practice medicine. Interviews with faculty members also provide information about the applicant's personal background and motivation to become a doctor.

Each medical school decides the number of students that will be admitted each year. Some medical schools accept high school graduates into combined bachelor's and medical degree programs, or combined medical and graduate degree programs.

Medical school applicants are urged to submit applications for financial assistance in conjunction with applications for admission. Loans, primarily sponsored by the federal government, are the major source of financial aid for medical school. Some schools offer academic scholarships.

For the 1998–1999 academic year, the American Association of Medical Colleges (AAMC) reported that 41,004 individuals applied to medical school. AMCAS participants applied to an average of 11.5 AMCAS-participating schools. Among first-time applicants, 45.9 percent (27,525) were accepted to a medical school. AAMC data further indicates that 6,353 candidates were accepted to two or more medical schools in 1998. Medical schools start issuing acceptances to the entering class by March 15 each year.

Medical schools typically provide four years of medical education, with the goal of preparing students to enter three- to seven-year programs of graduate medical training, which are referred to as residency programs. Medical school programs leading to the medical degree (M.D.) generally consist of two years of study in the basic sciences and two years in the clinical sciences. The basic sciences include anatomy, biochemistry, physiology, microbiology, pharmacology, pathology, and behavioral sciences. Clinical education begins in the third year with required clinical clerkships in internal medicine, pediatrics, family medicine, obstetrics and gynecology, surgery, and psychiatry. During six- to twelve-week rotations, students learn how to take a medical history, conduct a physical examination, and recognize familiar disease patterns. Students are allowed to shape their own course of study during the fourth year with elective courses in the clinical specialties or research. Most medical schools strive to integrate basic science and clinical science instruction throughout the four-year curriculum.

In addition to written examinations and direct observations of performance, Step 1 and Step 2 of the United States Medical Licensing Examination (USMLE) are also used to measure the acquisition of medical knowledge. Medical students take Step 1, which measures understanding and ability to apply

key concepts in the basic sciences, after completion of the second year of medical school. Passing Step 1 is a requirement for graduation at the majority of medical schools. Step 2, which is taken at the beginning of the senior year, evaluates medical knowledge and understanding of the clinical sciences. More than half of all American medical schools require passing Step 2 as a condition for graduation.

The Liaison Committee on Medical Education (LCME) monitors the quality of education that is provided by American medical schools that award the medical degree. Similar accrediting bodies exist for schools of osteopathic medicine and schools of podiatry.

Students apply to graduate medical programs through the Electronic Residency Application Service (ERAS), a centralized computer-based service that transmits applications, personal statements, medical school transcripts, and Dean's Letters to residency program directors. Students register their first, second, and third choices for residency placements through the National Resident Matching Program (NRMP). The NRMP provides an impartial venue for matching applicants and programs. The "match" facilitates placements by establishing a uniform procedure for communication between students and residency directors, and for announcing residency selections. Matches are usually announced in March of the senior year of medical school.

Graduate medical education programs (residencies) provide extensive, direct patient-care experiences in recognized medical specialties. Three-year residencies in family practice, emergency medicine, pediatrics, and internal medicine are typical. Several other specialties require one year of general practice followed by three to five years of advanced training. Participation in an accredited residency program and passing the USMLE Step 3 are requirements for licensure in most states.

## MEIKLEJOHN, ALEXANDER (1872–1964)

The youngest of eight sons, Alexander Meiklejohn (1872–1964) was born in Rochdale, England, of Scottish parents. His family moved to Rhode Island when he was eight, and he later attended nearby Brown University where he earned his baccalaureate and master's degrees in philosophy. He followed his graduate adviser and close friend James Seth to Cornell University to pursue his doctorate. A few years later, Meiklejohn married his first wife, Nannine, and they began a family.

Upon receiving his doctorate, Meiklejohn returned to Brown as an assistant professor of logic and metaphysics. He attained the rank of professor after nine years, having earned the respect of his colleagues and the admiration of his students. In 1901 Meiklejohn was named dean at Brown (his title was later changed to dean of undergraduates). His most distinctive act as dean was to disqualify Brown's championship baseball team over questions of sportsmanship and honesty. Brown's trustees supported this action and the students accepted it, but the alumni were outraged.

Even as he was establishing himself at his alma mater, Amherst College sought Meiklejohn as a new president who could bring energy and innovation to a college facing declining admissions and sagging academic standards. Inaugurated as president of Amherst in October 1912, Meiklejohn quickly set to

work to institute his educational ideals. Almost as quickly, his policies created enemies among the faculty, trustees, and alumni. He opposed the newly popular elective system, believing that students could better understand human culture and the natural world if they were not educated in narrowly specialized classes. He proposed a variety of options for a required curriculum, none of which the faculty accepted.

Turning his attention to other passions, Meiklejohn set up college extension classes in local mills and factories where students taught and interacted with laborers. He hired many new faculty members, terminated many older professors, and chose to ignore those whose tenure was beyond challenge. He irritated additional alumni by refusing to emphasize athletics and by maintaining the tradition of part-time basketball and football coaches. Even within the local community, Meiklejohn was unpopular: Neither he nor his wife were active in the predominant Congregationalist church, and she wrote children's books, traveled to Europe alone, and smoked cigarettes. Meiklejohn himself was known as a socialist, although he never affiliated himself with the Socialist Party. His outspoken opposition to the World War I eroded further the base of supporters of his presidency at Amherst. Nevertheless, he persevered.

By 1923 Meiklejohn was accused by his enemies of financial mismanagement, and the board of trustees asked for his resignation. In protest, twelve graduating seniors refused their diplomas, and eight faculty members resigned their positions. Though he resigned from Amherst, Meiklejohn capitalized on the media controversy surrounding his departure. He toured the country and delivered speeches to promote his first two books: *The Liberal College*, published in 1920, and *Freedom and the College* released in 1923.

President Glenn Frank offered Meiklejohn a professorship at the University of Wisconsin in Madison, but struggling with the death of his wife Nannine, he refused the appointment. The next year, however, Frank asked Meiklejohn to create an experimental college within the university, for which he would be given free reign to institute many of the reforms that he had advocated at Amherst and in his books and speeches. Meiklejohn took the post in March, 1926.

The Experimental College at the University of Wisconsin opened in 1927 with an incoming class of

119 men, who signed up for the two-year prescribed program of study. During the first year, students studied Athens in the fifth century B.C.E.; in their second year they traced the history of America through the nineteenth and twentieth centuries. Between academic years, students were expected to write an anthropological report on the region where they grew up. Faculty members (called advisers to defuse traditional expectations) met with students throughout each week in full-class meetings, but also held regular sessions with subgroups of twelve and engaged in many personal discussions with students.

External opposition to the program mounted quickly. University faculty criticized its independent governance and eclectic curriculum, and newspaper editorials and press reports lambasted its egalitarian pedagogy and Meiklejohn's arrogant style. Responding to these threats and to the economic problems of the Great Depression, the university administration proposed significant changes in the Experimental College in the 1930–1931 academic year. Standardized testing was to be introduced, and curriculum modifications made. Meiklejohn and the faculty refused to comply, and the university senate and administration closed the program in the spring of 1932. The short-lived experiment, however, gave birth to a long-lived legacy: Over the next half-century, the Experimental College inspired scores of innovative undergraduate programs across the United States.

Following the closure of his college, Meiklejohn and his second wife, Helen, moved to Berkeley, California, where they helped found the San Francisco School for Social Studies. The school was open and free to all applicants—from traditional students to housewives, laborers, and retired persons. Beginning with the first class of 300 students in 1934, readings and discussions centered on classical social thinkers and contemporary social problems. By 1942, when the school closed due to economic pressures from World War II, more than 1,700 students were enrolling each year. Meiklejohn pursued his interests in constitutional rights to free speech, protesting against the permanent installation of the House Un-American Affairs Committee and loyalty oaths. He published *Free Speech and its Relation to Self Government* in 1948, and received honors from the American Civil Liberties Union and the Socialist League for Industrial Democracy. He served as vice president of the league for almost forty years. Alexander Meiklejohn died at the age of ninety-two.

Alexander Meiklejohn's influence is still felt in higher education. Scott Buchanan and Stringfellow Barr rebuilt St. John's College based on Meiklejohn's Experimental College in Wisconsin and Robert M. Hutchins' reforms at the University of Chicago. In Meiklejohn's later years, he was a "sympathetic observer" and senior guide for Joseph Tussman and others who founded the Experimental College at the University of California, Berkeley. Tussman described himself in those years as a "direct spiritual descendent" of Alexander Meiklejohn.

## AUTOBIOGRAPHICAL MEMORY

In the early twenty-first century there is general agreement among memory researchers that memory

consists of a number of distinctly different types of memory rather than one single memory. A brief overview of the major divisions in memory will help put autobiographical memory in context. Philosophers have long made a distinction between *knowing how* (e.g., knowing how to ride a bicycle) and *knowing what* (e.g., knowing what a bicycle is). Modern research has verified the distinction between these two types of memory, and they are currently called procedural or implicit memory (knowing how) and declarative or explicit memory (knowing what). In 1972 Endel Tulving divided declarative memory into semantic and episodic memory. Semantic memory, because it contains general information such as facts, names, and important historical dates, could be described as a person's knowledge of the world. Episodic memory refers to a person's memory of events.

Autobiographical memory is a large and important subset of episodic memory containing those events that constitute the story of one's life. In the words of Katherine Nelson, autobiographical memory is "specific, personal, long-lasting, and (usually) of significance to the self-system. Phenomenally, it forms one's personal life history" (p. 8). If the first meeting with a loved one involves going to a movie, that event stands a good chance of becoming part of autobiographical memory. Other occasions on which movies are attended, however, will be remembered for a short time but probably will not become part of autobiographical memory. Instead, those events will contribute to generic memory. Generic memory contains memory for frequently occurring events such as brushing teeth or going to a movie. When asked about such events, it is unlikely that a specific instance of toothbrushing or going to a movie will be remembered.

### The Organization of Autobiographical Memory

Autobiographical memory is organized as nested clusters of events that are all highly interconnected. Take the memory of a lawyer as a hypothetical example. Under the topic of school, that person would find events for elementary school, secondary school, college, and law school. Nested under each of those categories would be the events for each year (e.g., sophomore in college). Under the category of sophomore in college would be the events for each semester, which, in turn, would be grouped in categories such as academic events (e.g., classes), jobs, and friends. All these autobiographical events would be accessible in a number of ways. A particular event

might involve a certain year in college, a particular job, and certain friends. That event could be accessed when thinking about school, friends, or jobs.

The topic of school is just one example of the many topics that have many subcategories. Other such topics include marriage, jobs, and military service. Just like the clusters of events nested under topics, the topics also are highly interconnected. The end result is a memory system that has the ability to retrieve the memory of a particular event from a large number of starting points. The most obvious example of the power of autobiographical memory to retrieve events is involuntary memory—memories that just pop into mind. In a 1998 article Dorthe Berntsen described her studies of involuntary memories, which showed that people average six to eight such memories every day.

### Memory for Autobiographical Events

Remembering an autobiographical event usually involves both retrieving the content of the event (remembering what) and placing it in time (remembering when). Of course, memory for both fades over time. Autobiographical memory can be either reproductive or reconstructive. When it is reproductive, virtually all the details are retrieved from memory. When it is reconstructive, a few major points are retrieved from memory and the rest is constructed from generic memory. People are very good at reconstructing memory from generic events, and they are usually not aware that they are doing so. One of the consequences is that memory for old events is often wrong. Sometimes the error is minor and sometimes it is not.

Memory researchers have shown that memory for the content of the event gradually changes from being almost entirely reproductive to being, after about a year, almost entirely reconstructive. By contrast, memory for when an event occurred is almost always entirely reconstructive.

There are three additional distinctive characteristics of memory for autobiographical events. First, as time passes, the number of events that can be recalled drops off rapidly at first and then more slowly—a negatively decelerating curve. Second, older people show what David C. Rubin and his colleagues called a "reminiscence bump." Older people recall more events for the period when they were in their twenties than predicted by the negatively decelerating memory curve. Typically, many important life

events (such as college graduation, marriage, and children) occur when people are in their twenties. Research has shown that the reminiscence bump can be attributed to these important life events. Third, almost all people show infantile amnesia. When people are asked to recall events from their childhood, they usually cannot recall events prior to age three. Not only are they unable to recall memories before age three, but the number of memories retrieved between ages three and six is also markedly below the number available after that period. Infantile amnesia is an intriguing puzzle because researchers have shown that children under age three can report details of isolated specific events and, most important, can remember them for up to two years. There is a growing consensus that the answer to the puzzle may lie in the development of autobiographical memory.

### **The Development of Autobiographical Memory**

By the early twenty-first century there was considerable evidence that children learn how to talk about memories with others. They learn how to tell their life stories as a narrative. This is the social interaction view of autobiographical memory. This view proposes that infantile amnesia is overcome when children learn how to retain their memories in a recoverable form by turning them into narratives.

One strong source of support for the social interaction view has been the investigation of mother-child discussions of past events. These discussions can be classified as narrative or pragmatic. The narrative conversations focused on what happened when, where, and with whom. The pragmatic conversations used memory to retrieve specific information such as “Where did you put your book?” Children of mothers who used the narrative type of discussion remember more about the events than children of mothers who used the pragmatic type of discussion.

### **Autobiographical Memory as an Expert System: Implications for Learning**

Experts learn new material in their field much faster than novices, and they retain that material much better as well. The reason for their outstanding performance in learning and memory is that they have a highly organized and detailed memory for their area of expertise. This allows them to relate new material to one or more pieces of information that they already know. Metaphorically speaking, they have many potential pegs on which they can hang new in-

formation. When they have to retrieve the new information, they can follow a well-beaten path to that information.

Autobiographical memory is also a highly organized and detailed memory. When it is possible to relate new information to life events, autobiographical memory functions in the same way as an expert system. The new information will be learned faster and remembered better than information that cannot be related to life events (or to another expert system).

### **Life Is Pleasant—and Autobiographical Memory Makes It Better**

In studies of subjective well-being conducted around the world, people generally report that they are happy with their life. In the United States, this positive feeling is found in people with physical disabilities, people with mental illness, low-income people, minorities—in short, it is found for virtually all categories. Research on autobiographical memory shows two sources for this positive feeling of well-being. First, life events are generally pleasant with positive events occurring roughly twice as often as negative events. This is true for childhood memories, involuntary memories, and adult memories.

Second, the general level of pleasantness typically is enhanced when remembering life events. That occurs because the emotion attached to the events fades over time but the emotion for unpleasant events fades much faster than the emotion for pleasant events. Thus, the overall emotional tone becomes more pleasant for autobiographical memory. The mechanism responsible for this change appears to be the rehearsal (thinking about or talking about) of pleasant events.

For most people, autobiographical memory is a very positive and useful part of memory. It is equivalent to an expert system and therefore can be very helpful in learning new material. Most important, it holds the story of one’s life. That story is typically very pleasant and, because negative emotions fade rapidly, becomes more pleasant as time passes. People’s lives would be much reduced without their access to autobiographical memory.

CHARLES P. THOMPSON

**DEVELOPMENT OF**

Traditionally, the construct of memory has been divided into a number of different types, defined large-

ly in terms of the length of time over which information is retained or stored. For example, memory is divided into a very brief (on the order of milliseconds) sensory store for visual or acoustic properties of a stimulus; short-term or working memory, in which information can be stored and manipulated for about twenty seconds; and long-term memory, in which information can be stored virtually permanently. Long-term memory can be further divided into storage of procedures or skills, such as how to tie a shoe, and storage of explicit or declarative memories, such as memories of personal events or of general knowledge about the world. The study of the development of each of these systems can aid in understanding the cognitive abilities of both children and adults. Because working memory has important implications for learning and education, it is the focus of this entry.

**Defining and Measuring Working Memory**

Whereas short-term memory refers to the storage of information over brief delays, working memory refers to the capacity to store information for brief periods and to manipulate it during storage. A prominent model of working memory suggests that it is a multicomponent resource consisting of a limited-capacity central executive or "work space," where processing takes place, and two storage components, one for verbal information and one for spatial information. Working memory underlies a variety of complex cognitive tasks, including reading comprehension and mental arithmetic. For example, mentally adding the numbers 12 and 49 requires that both numbers be held in mind as the operation of addition is performed. Because conscious manipulation of information depends on working memory, one must examine its development in order to understand the abilities of different aged children to comprehend, learn, and remember the information taught to them.

Unlike the capacity for long-term memory, which is considered to be virtually unlimited, the capacity for working memory is limited to a few items. Indeed, the increase in the number of items that can be stored and manipulated at a time (referred to as the working memory "span") is a major source of age-related change in working memory. Moreover, at any given age, there are differences among individuals in their working memory spans. Measures of working memory span thus are integral to the study of working memory. Methods of assessing working

memory include the reading span task, the A-not-B task, and the imitation task.

**The reading span task.** A classic measure of working memory in adults is the reading span task. Reading span is assessed by having adults read a series of sentences and then recall the final word of each of the sentences in the order that they read them. The reading span task requires both the storage and manipulation of information: The reader must store the last word of each sentence while reading subsequent words and sentences. Measures have also been developed to assess working memory throughout childhood, and these measures reveal systematic increases in working memory capacity across age.

**The A-not-B task.** In the second half of the first year of life, working memory most frequently is assessed by the A-not-B task. In the A-not-B task, a small toy is hidden in one of two identical wells (Well A) in full view of the infant. After a brief delay, the infant is allowed to reach into Well A to find the toy. Following several "A" trials, the toy is hidden in the second well (Well B). Even though the infants watch as the toy is hidden in Well B, they often reach to Well A again, making the "A-not-B error." Overcoming the A-not-B error, and thus, successfully searching in Well B, requires that infants (1) remember where they saw the toy hidden (requiring storage of information) and (2) inhibit the learned tendency to reach to Well A (requiring processing of information). As working memory ability increases, infants are able to withstand longer delays without making the A-not-B error. The delay that infants are able to tolerate without making the error increases about two seconds per month between the ages of seven to twelve months.

**The imitation task.** In the second year of life, working memory can be assessed using imitation. In a standard imitation task designed to assess short-term or long-term memory, props are used to produce a sequence of actions (e.g., making a rattle by putting a ball into a nesting cup [step 1], covering it with another cup [step 2], and shaking the cups to make a rattle [step 3]). The child then is allowed to imitate the sequence either immediately (as a measure of short-term memory) or after a delay (as a measure of long-term memory). To assess working memory, the steps of several sequences are presented in interleaved order. That is, rather than the steps of a single event in sequence (A-1, A-2, A-3, with the alphabetic character referring to the sequence and the number referring to a step in the sequence), the

child sees, for example, A-1, B-1, C-1, A-2, B-2, C-2, A-3, B-3, C-3. The child is then provided with the materials for each of the sequences in turn (e.g., all of the materials for sequence A) and is encouraged to produce the sequences. The interleaving of the sequences during presentation requires that the child not only store the information for each individual step but also attend to subsequent steps and integrate the steps into their respective sequences. Researchers have used the imitation task with seventeen- and twenty-month-old children, finding increases in performance, and therefore in working memory, with age.

**Tasks for assessing older children.** Working memory may be assessed in older children with an adaptation of the reading span task and with a similar task using numbers. Both tasks indicate increases in working memory across the age range of seven to thirteen years. In addition, children with reading disabilities perform at lower levels on both tasks than do their normal age-mates, and children with arithmetic disabilities have trouble with the number task. Thus, working memory plays an important role in the development of reading and number skills during middle childhood. Adult levels of performance on working memory tasks are reached by the high school years.

### Factors Affecting Developmental Changes in Working Memory

Developmental changes in working memory may be due to several factors, including brain maturation, increases in the speed of information processing, increases in knowledge, better use of strategies, and more effective management of attention. For example, the processes involved in working memory are largely dependent on the prefrontal cortex of the brain. The prefrontal cortex matures late relative to other brain regions, such as those involved in sensory and motor processes, and does not reach full maturity until adolescence or even early adulthood. Thus, the time courses of development of the functions of working memory and of the brain regions thought to support them are closely linked. Brain maturation also involves a process called myelination, in which a fatty substance surrounds the nerve cells and aids in the conduction of brain impulses. Myelination may increase the speed of processing, thereby increasing working memory abilities as children mature: Faster processing allows for the storage of more information before it decays from working memory.

Other factors that may affect the development of working memory include increased knowledge, strategy use, and management of the focus of attention. Breadth of knowledge affects working memory to the extent that new information can be linked to existing knowledge. For example, it is easier to store nine letters that form three words that are already stored in long-term memory (e.g., p-e-n, d-o-g, h-a-t) than to store a list of nine random letters in working memory (e.g., p-o-h-e-d-t-n-g-a). The learning of and increased efficiency in the use of strategies also aids working memory. For example, as children reach the late grade-school years, they begin to spontaneously use rehearsal (the strategy of repeating the information mentally) when they attempt to remember something new. Working memory also develops with age as children gain increasing control over the focus of their attention. This permits them to attend to more information, switch the focus of attention as needed, and inhibit attention to irrelevant information. All three of these factors—increased knowledge, strategy use, and management of attention—likely play a role in the development of working memory throughout childhood.

### Summary

Working memory involves the conscious storage and manipulation of information that is integral to the performance of complex cognitive tasks. It is clear that working memory develops throughout childhood, as children are able to hold increasingly more information “online” even as they perform a greater number of mental manipulations on the information. Because working memory underlies so much of mental functioning, it is important to understand its development, as well as the sources and implications of individual differences in it.

## GRAPHICS, DIAGRAMS, AND VIDEOS

Graphics, diagrams, and videos are frequently used to enhance learning of verbal material. Indeed, as much as half of the space in K–12 textbooks is devoted to graphics and diagrams, and videos are frequently presented in classrooms. Furthermore, recent technological advances have made possible the use of additional, primarily visual, materials for instruction, such as animation and hypertext.

Presumably, graphics, diagrams, video, and other visual materials are used to make information accessible and memorable. But how might such visual materials be exploited to facilitate learning and memory? When are such displays actually beneficial for learning, and when are they simply decorative or even distracting? This brief review begins with a discussion of general research on how visual media displays aid comprehension and enhance memory for verbal material, and the circumstances in which visual materials are distracting and perhaps even reduce comprehension memory of verbal material. This discussion incorporates guidelines for the design of visual displays for effectively enhancing memory in the context of specific commonly used displays such as graphic organizers, graphs, diagrams, and videos.

### Main Benefits of Graphics, Diagrams, and Videos

Visual displays and videos play a number of important roles in learning. Perhaps the most cited cognitive explanation for the benefits of presenting information both visually and verbally is Allan Paivio's dual-coding theory. In classic memory studies, Paivio and his colleagues demonstrated that people were better at remembering lists of words coded visually and verbally, rather than merely verbally. One explanation for the superiority of dual-coding is that by encoding information to be learned in two modalities rather than a single modality, people have multiple retrieval cues that help them access information, thus enhancing memory.

A second general benefit of visuospatial displays is that they are visually appealing. Viewers' attention is attracted to these displays, and viewers are more likely to study them for longer periods of time. This, in turn, can lead to enhancement of memory for information depicted in them. For example, one study of memory for materials taught in introductory psychology courses found that stu-

dents recalled ideas and examples presented in videos and in-class demonstrations better than information presented in the text alone.

In addition to directly enhancing memory for information, diagrams, graphics, and videos can also make complex information easier to comprehend. Specifically, visual representation can make complex information "visually obvious" and thus require less cognitive effort to understand than text-based descriptions of the same information. Better comprehension, along with more cognitive resources that can be allocated to learning and memory, will together enhance memory for the information to be learned.

### Concepts that Visual Displays Are Most Useful in Communicating

Visual displays are particularly beneficial to the comprehension of some classes of concepts that often involve specialized types of displays. First, visual displays are useful for communicating cause-and-effect information. For example, a diagram can help illustrate how turning a key can unlock a door. When such displays are designed to highlight the cause-and-effect sequence (e.g., by animating one portion at a time or by using a sequence of arrows), viewers' comprehension and memory for the cause-and-effect information is enhanced.

Second, visual displays are frequently useful for representing relationships amongst elements (e.g., a Venn diagram, a text-based graphic organizer, a scientific model). One benefit of such representations is that they can facilitate problem solving. Another benefit is that they provide concrete representation of key concepts or elements and their relationships. Graphic organizers, for example, are often used to represent relationships among the main ideas in a text. For example, information in a text can be summarized in matrix form such that similar concepts are closer together along one or more dimensions. Research has suggested that representations that group relevant concepts, such as matrices, can significantly enhance memory for text compared to representations that simply summarize materials, such as outlines. Indeed a general principle that is relevant for any diagram intended to represent relationship elements, including graphic organizers but also including graphs, flowcharts, and so on, is that information that is closely related be placed close together on a page or related visually (e.g., via Gestalt principles of grouping).

Third, visual displays are useful for communicating information that is intrinsically visuospatial. For example, visual displays of a map of a building or a drawing of how different parts of a car engine fit together communicate information that is difficult to describe verbally. Not all intrinsically visuospatial displays, however, are equally beneficial. One general guideline is to design displays that facilitate integrating relevant information (placing text and graphics together) to reduce working memory load and allow viewers to focus on learning relevant content. A 2001 book by Richard Mayer on multimedia learning includes a number of guidelines for the design of such displays.

Fourth, visual displays provide natural mappings to quantitative information (e.g., more is higher) and thus increase comprehension and memory for quantitative information. One difficulty associated with graphs is that students often make interpretation errors and therefore remember erroneous data. In a 2002 article, Priti Shah and James Hoeffner discuss a set of guidelines for teachers and other graph designers who need to depict data for students. These guidelines include making relevant trends visually salient in the graph and writing text to be compatible with information in the graph.

### **Additional Benefits of Visual Displays**

In addition to making some concepts easier to understand, diagrams, graphics, and videos tend to focus viewers' or readers' attention and thus highlight important information. Displays or videos can guide a viewer's attention from one step to the next in a description of causal information or in instructions. For example, a sequence of arrows might highlight how a mechanical device, such as a bicycle pump or a toilet, works, or a sequence of panels might instruct someone how to bake cookies. Such displays, by highlighting information or key elements in a sequence, help students learn and remember relevant information.

In addition to the cognitive aspects of how they influence memory, visual displays and videos serve a social function beneficial to memory. In particular, visual displays and videos provide a common motivating experience for students. In "anchored instruction," students view movies with built-in problems that serve as a reference point for lessons on a wide variety of topics such as solving mathematical problems, discussing social issues, and understanding physics concepts. The common anchor

may provide a social and personal context for information to be learned.

The use of graphics, diagrams, and videos includes not just presenting such visual information to students but also asking them to create them. Creating visual artifacts or inscriptions appears to be motivating to students, especially when they share their products with fellow students. Furthermore, developing them forces students to consider the important elements and relationships and also to identify what information they understand and what they do not. Thus, the creation of graphics, diagrams, and videos can be used to enhance comprehension and memory for to-be-learned information.

### **Drawbacks of Displays and Videos**

Despite the benefits of graphics, diagrams, and videos for helping students comprehend and remember important information, there are some cases in which displays and videos can be harmful. Specifically, because graphics, diagrams, and videos attract attention, it is possible that in many cases such visual presentations serve as seductive details detracting attention from important information and thus impair rather than enhance learning. A concrete example of a display that may serve as a seductive detail is a picture, in a scientific text about how lightning is formed, of someone who was struck by lightning. Although the intention of such a picture might be to interest the students in the content of the text, research has found that, in fact, displays such as these are actually distracting and reduce the quality of readers' understanding of the scientific content of the text. Videos, also, can serve as or include seductive details detracting viewers from the main message of a particular lesson.

In summary, this general discussion of visual displays suggests that diagrams, graphics, and videos can help users comprehend relevant information and enhance memory for that information. The content and format of the information, however, should be consistent with the goals of communication. When the content is not consistent with the goals of communication, students may remember irrelevant or inaccurate information.

**IMPLICIT MEMORY**

Implicit memory refers to the expression of past events on current behavior when people are not try-

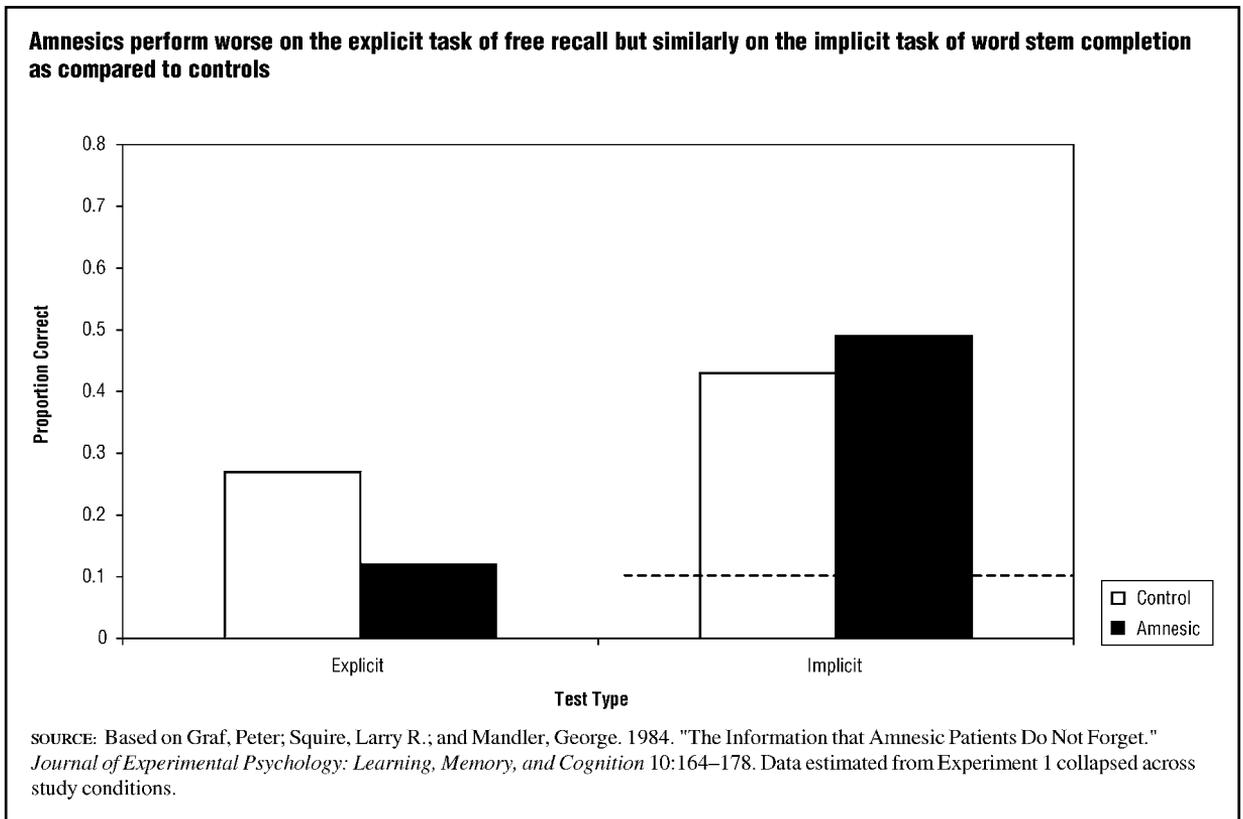

ing to retrieve these past events and when they are usually not even aware of the events' influence. This process is different from explicit memory, which refers to conscious attempts to retrieve memories of past events; in implicit memory tests there is no conscious effort to retrieve. The customary use of the terms *memory* or *remembering* refers to explicit, conscious recollection during which people attempt to travel back in time to mentally relive or reexperience past events. Many behaviors people perform, however, reflect past learning even when they are not consciously attempting to retrieve; therefore, these behaviors reflect the manifestation of implicit memory. Some of these behaviors involve motor skills. When people tie their shoes or ride a bicycle or walk, they need not consciously retrieve their first attempts to learn these skills. The same is true of other types of learning. It is much easier to read a passage of text that one has read before, even if not consciously trying to remember the original time the passage was read. As these examples indicate, implicit learning is sometimes referred to as occurring rather automatically or at least to having an automatic component.

**As a Reflection of Conscious Learning**

Implicit memory measures are sometimes said to reflect unconscious learning because densely amnesic brain-damaged patients typically show intact uses of implicit memory. The data in Figure 1 are from a 1984 experiment by Peter Graf, Larry Squire, and George Mandler. They compared brain-damaged participants who displayed serious impairments on explicit memory tests such as recall and recognition to age- and education-matched control participants. In one test condition, both groups of participants studied lists of words and attempted to recall them in any order (free recall). As can be noted on the left of the graph in Figure 1, the patients recalled the words much worse than did the controls. This pattern reflects the patients' deficit on an explicit memory test, in which they were asked to consciously retrieve past events.

In the implicit test, both groups studied the lists of words but were tested by being shown three-letter stems of words with the instruction to produce the first word that came to mind in response to each stem clue. So, if the word *chair* had been in the list, participants would get *cha* and be asked to say the first word that came to mind (*chain, chapter, challenge* and so on—each stem had at least ten possible

FIGURE 1

completions). If *chair* had not been presented in the list, people in both groups produced it about 10 percent of the time (the dashed line on the right side of Figure 1). However, if *chai* had been presented in the list, both patients and the control participants produced the word about 45 percent of the time. The fact that both groups completed the word so much above the base rate reflects priming, the basic measure of implicit memory tests. Priming is defined as the difference between performance on a test when the relevant information has been presented and performance when the relevant information has not been recently presented. Therefore, the amount of priming reflected in the data in Figure 1 was about 35 percent (45% in the primed condition minus the 10% base rate). Although the participants were told to produce any word that came to mind, the presentation of *chair* in the list primed them to produce that word rather than another on the test.

This priming effect reflects a use of memory, but not a conscious or intentional use of memory. Because the patients were densely amnesic and probably did not remember even studying the list of words, the priming may be said to be unconscious

(in this sense). The amnesic patients produced just as much priming as did control participants. Because the patients had suffered brain damage that impaired their use of explicit memory processes, it appears that the brain mechanisms and processes that underlie explicit and implicit memory tests are quite different. Put another way, the results show that memory is not a unitary entity; people with certain types of brain damage can be severely impaired on one type of memory test and unaffected on other types of tests.

### Implicit Memory Tests

The study of implicit memory began in psychology in the early 1980s and in the early twenty-first century there is a large amount of literature on the topic. There seem to be at least two distinct types of implicit memory tests, perceptual and conceptual.

**Perceptual memory tests.** Perceptual implicit memory tests challenge the perceptual system by presenting impoverished test stimuli to which participants respond. The word stem completion test already described (*cha*) is one such test. Others are word iden-

tification (presenting words very briefly and having participants guess what they are), and word fragment completion (naming words from fragments such as *l\_p\_a\_t*. (That fragment is hard if not recently primed [with word *elephant*].) If pictures are used as study materials, then the test can involve giving fragmented forms of pictures or having them be gradually clarified through a series of successively fuller fragments until the participant can identify the picture. Again, the measure in all cases is priming—as reflected by more accurate or faster completion of the target when it has been studied relative to when it has not been studied.

Factors that greatly affect priming on perceptual implicit memory tests are often quite different from those that affect performance on most explicit memory tests in both patients and in healthy control participants, indicating further that these two types of tests seem to be measuring different processes. For example, modality of presentation of words strongly affects performance on perceptual implicit tests. Visual presentation of words enhances priming on visual tests, whereas auditory presentation enhances priming on auditory implicit tests (e.g., presenting words describing noise with auditory cues for identification). Modality generally matters little in tests of explicit memory. On the other hand, factors that can have a great effect on explicit memory tests can have little or no effect on priming on implicit tests. For example, when participants read pairs of words (*hot* and *cold*) or generate the second word from a clue such as “opposite of cold,” they scored better on an explicit test of recognition for the words they generated, but exhibited more priming for the words they just read on an implicit test, in which they had to quickly identify the word. The data are shown in Figure 2.

The results described above can be explained, at a general level, by the theory of transfer appropriate processing. This principle states that performance on memory tests will be enhanced if there is a match between the conditions of study and test, which will permit the study experience to transfer better to the test. For example, if the test involves deciphering a fragmented or briefly presented word given visually (classified as a perceptual test), then performance on this test should benefit from prior visual presentation more than from a prior auditory presentation or from generating the word, as is indeed the case. Practice reading a visual word (versus hearing or

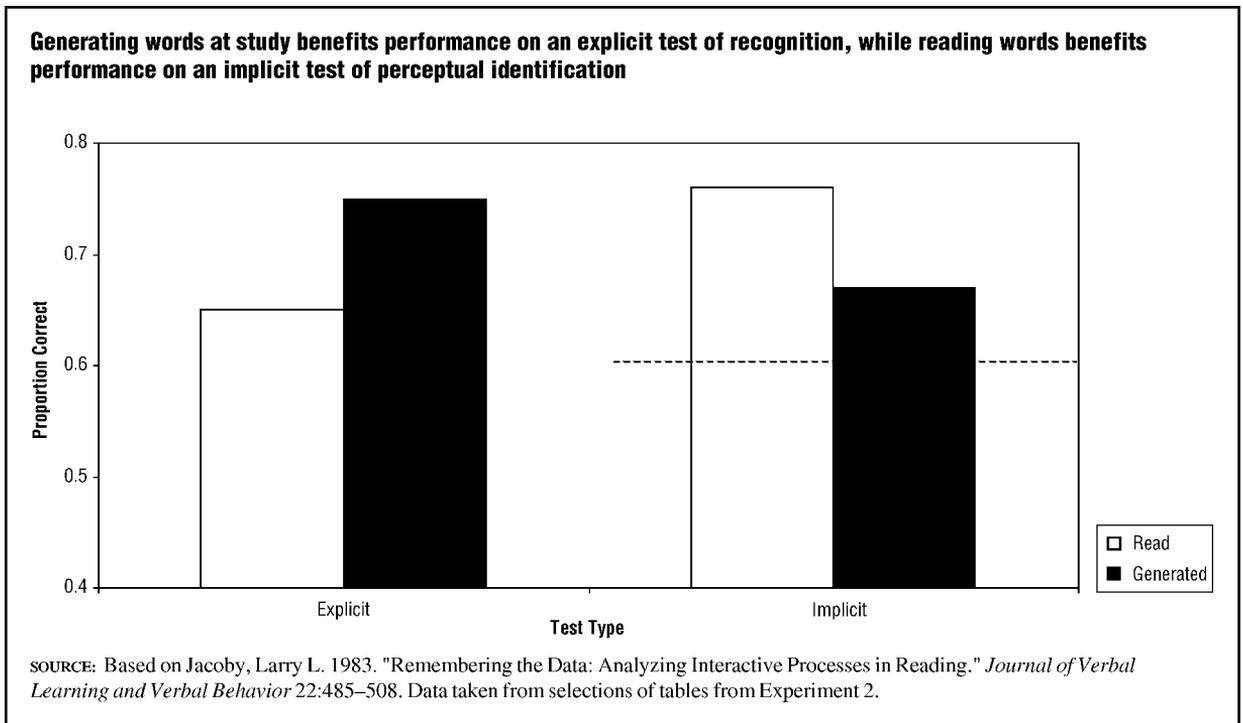

generating it) transfers better to a test that also involves reading words.

**Conceptually driven tests.** Whereas most implicit tests depend on perceptual processing, most explicit memory tests depend heavily on the meaning of the concepts or events that are being remembered. These tests are called conceptually driven tests because, when people are trying to retrieve past events, it is the meaning of the events that is important. Generating a word involves more attention to meaning than simply reading it, and so generating produced greater explicit recognition in results shown in Figure 2. Again, this finding is in accord with the transfer appropriate processing theory. The transfer appropriate processing theory can account for a large body of findings although some problems remain.

Although explicit memory tests are usually driven by meaning or by conceptual information, there is a class of implicit memory tests that is also conceptually driven. These tests are probably the most relevant for education, but they have not yet been studied as much as perceptual implicit tests. One class of conceptual implicit memory tests that has been studied is the general knowledge test. “What animal did Hannibal use to help him cross the Alps in his attack on Rome?” and “What is the name of the ship that carried the pilgrims to America in 1620?” are examples of questions on general knowledge tests. Prior exposure to the words *elephant* or *Mayflower* before the questions are asked increases correct answers to these questions, which reflects priming of concepts. Free association tests (“say the first word that you think of to the stimulus word *tusk*”) and category association tests (“list as many African animals as you can in thirty seconds”) are other examples of conceptually driven implicit memory tests. These priming effects again seem to be indicative of implicit retrieval because they also appear in brain-damaged patients with severe difficulties in explicit expressions of memory.

In some sense, much of education is intended to permit people the automatic, unconscious retrieval of facts, routines, and principles when they need them. Education is meant to provide learning experiences that will, at least in some cases, last a lifetime. Of course, not all facts and principles will be remembered for that long. Much information learned in the classroom will be forgotten (at least when explicit tests are given). The hope is that one’s general knowledge and skills (writing, thinking logically)

FIGURE 2

will survive. There are no studies of residual, implicit retention of formal education but such studies will surely come in the future.

## MENTAL MODELS

Mental models, also called situation models, are mental representations of the state of affairs in a real or possible world. They serve as mental simulations of events. For reading, a mental model represents the situation described by the text rather than the text itself. The creation of a coherent mental model is the goal of comprehension.

Mental models are complex representations that contain many different types of information. This includes a spatial-temporal framework about the spatial context in which an event occurred and the time period in which the event transpired (i.e., where and when it occurred). They also contain tokens to represent entities, such as people, animals, objects, and ideas. These tokens might have properties associated with them, such as physical characteristics, emotions, or names. Within a framework there may be structural relations that define the event. This can include spatial relations (e.g., the umpire is behind home plate), ownership relations (e.g., the players are using the shortstop's ball), social relations (e.g., the two teams are bitter rivals), and so forth. Finally, because events are dynamic, several frameworks can be joined by linking relations that contain temporal order and causal information.

### The Role of Experience

Mental model creation involves integrating prior knowledge with what has been given. This allows inferences to be drawn for information that has not been provided. Of course, the more knowledge a person has, the more likely it is that an adequate mental model will be constructed. For example, when watching a baseball game, a person with a lot of baseball knowledge will better understand the structure of the game, the causal and goal-related re-

lations among the players, and the sequence of events.

The structure of one's experience influences the creation of mental models. Suppose a person reads a text on a topic that the reader has a fair amount of knowledge of, such as going to a baseball game. In this case, there is a certain sequence in which the events occur (e.g., buying a ticket before finding one's seat). Even if two events are adjacent in the text, reading times increase as the distance between them in the standard sequence increases. So when building mental models, people consult their knowledge systematically. It is as if they are scanning sequentially through their knowledge to assess where the current events fit. The greater the distance, the longer the scanning process and the more that needs to be inferred.

Mental models are essentially an amalgam of the given information that can be acquired through a film, book, lecture, discussion, and so forth, along with prior knowledge that a person has in long-term memory. The use of mental models is found in a wide variety of circumstances, including language comprehension and memory.

### Comprehension

Mental models are critical for understanding. When people comprehend language, they create three types of mental representations. The simplest is a verbatim representation of what was heard or read. This is forgotten very quickly unless there is something important about the exact wording, as with a joke. At a more abstract level is the propositional textbase. This is a representation of the idea units that were expressed. For example, the sentences "The ball was hit by the batter" and "The batter hit the ball" would correspond to the same propositional representation. This representation is forgotten less rapidly. Finally, at the most abstract and highest level is the mental model. This is a referential representation of the described events. The mental model is a representation of what the message is about. In contrast, the verbatim and textbase levels are representations of the message itself but may serve as scaffolding from which to build a mental model.

While the goal of comprehension is to construct a mental model, its organization and function can influence comprehension itself. During reading, people keep track of what is going on in the described situation. For example, readers may keep

track of the spatial location of a protagonist in a story. When that person moves from one location to another, knowledge about people or objects in the old location become less available. Switching from one spatial framework to another influences what information is readily available during comprehension. Moreover, the further the protagonist moves from the original location, the less available the information becomes. A similar thing occurs for temporal frameworks. Short time periods are more likely to be part of the same time frame, whereas long time periods are more likely to include a shift to a new time frame, and hence a new situation. Information that was relevant to the original situation is less available after a large time shift. Finally, people also monitor a protagonist's goals. Information that is relevant to current, unsatisfied goals is more available than information relating to goals that were successfully completed. The prior goal information is no longer maintained in the current mental model.

When the structure of the situation changes, reading times increase, as if readers are monitoring the described events. This includes changes in space, time, entities, causality, or the goals of the protagonist. When a major change in the described situation occurs, people update their mental models. In addition to monitoring event changes, people may also notice inconsistencies with what has been described before. Such inconsistencies result in increased reading times as the reader tries to resolve what they know of the situation with the current information.

One of the most important dimensions that people monitor is causality. Information varies in the degree of its causal importance. Information that plays an active role in the described situation is causally more important. Such information is typically read more quickly. Presumably, this is because it can be more easily integrated into the current mental model.

### Memory

Mental models are also involved in memory. At very long periods of time, this is the representation that will dominate a person's recollections. Many of the influences during comprehension carry over into memory. For example, shifts in a situation during comprehension result in the memory being organized around those shifts. Also, causally important parts of an event are better remembered than less important parts. It should be noted that the ease

with which information is integrated into a mental model has an influence on the ability to identify that situation later. Continuous and consistent descriptions are remembered better than discontinuous, inconsistent descriptions.

Mental models include both given information and inferences a person generates. With the passage of time, it becomes difficult to disentangle these two. People often mistakenly identify information as having been encountered before if it is consistent with the previously described situation, even when that information is new.

How information refers to the world is important for how it is represented in mental models. This has important consequences for memory. When given a large set of related information, a person can integrate this information into one mental model if the information can be interpreted as being consistent with a single situation in the world. Otherwise, it may be stored in separate mental models. When a person needs to remember one piece of information, if there are related mental models containing related but irrelevant information, this will produce interference, causing the memory retrieval to be slower and more error prone. If, however, the information is integrated into a single model, there is no such cost to memory.

While these findings suggest that a mental model can influence memory retrieval, it is also possible to remove these influences to a certain degree. As mentioned earlier, people create multiple representations during comprehension, including verbatim, propositional, and mental model representations. The mental model will contain many inferences and will also capture the perspective of the comprehender. If the mental model is discredited in some way, such as asking a person to take a different perspective on the text that was read, then the person will rely less on the mental model and more on the propositional representation. For example, people reading a description of a baseball game might originally be told that the home team was going to make the playoffs. Then when the person is asked to recall the story, they could be told that the story was about a team that ended up in last place. This shift in perspective will cause a decrease in the number of inferences a person reports and also increase memory for those previously unremembered propositions that are consistent with the new perspective. Thus, the person has disregarded their mental model during memory retrieval.

## Summary

Mental models are mental representations of specific states of affairs in the world. They are created using the knowledge a person has at hand, along with prior knowledge. The organization and extensiveness of this prior knowledge is of great importance. People use mental models during comprehension as the basis for their understanding. Changes in the described situations cause people to update their mental models, which has a tangible effect on the comprehension process itself. Finally, mental models appear to be the form of mental representation that is stored in memory for long periods of time. The ability of a person to remember information in part reflects the organization and structuring of information into mental models.

## METAMEMORY

Metamemory refers to a person's knowledge about the contents and regulation of memory. The term originally derives from the work of John H. Flavell in the early 1970s. Metamemory enables a person to reflect on and monitor her memory. In addition, metamemorial knowledge plays an important role in planning, allocation of cognitive resources, strategy selection, comprehension monitoring, and evaluation of performance.

This entry begins with a description of the two main structural components of metamemory—declarative knowledge, which enables a person to evaluate the contents of memory, and procedural knowledge, which enables a person to monitor and regulate memory performance. It next summarizes important developmental trends in metamemory, then discusses several important educational implications of metamemory research, including the rela-

tionships among metamemory, strategy instruction, and self-regulation.

### **Declarative and Procedural Aspects of Metamemory**

Most theorists distinguish between declarative and procedural components of metamemory. The declarative component corresponds to storable knowledge about the contents and contexts of memory use and includes knowledge of memory's contents, knowledge of essential intellectual tasks such as reading and problem solving, and conditional knowledge about why and when strategies are most effective. The procedural component includes knowledge about procedural skills necessary to manage memory efficiently, including control processes such as planning and evaluating and monitoring processes such as judgments of learning. Some theorists, but especially those interested in the relationship between metamemory and social cognition, have proposed a third component, usually referred to as a beliefs component, that regulates affect, social cognition, and efficacy judgments of memory performance. The focus here, however, is on the declarative and procedural components.

The declarative component includes at least three distinct subcomponents: knowledge of contents and capacity, knowledge of tasks, and conditional knowledge about optimal memory performance. The content subcomponent enables a person to assess whether he possesses enough knowledge to meet task demands. The task subcomponent allows a person to determine whether he fully understands task demands and possesses adequate resources to perform the task. The conditional knowledge subcomponent, which many view as the most important of the three, helps a person determine why, when, and where to use a particular strategy or under what conditions he is most likely to achieve optimal performance. Conditional knowledge plays an especially important role in self-regulation.

The procedural component includes control and monitoring subcomponents. The control subcomponent includes regulatory processes such as planning, selection of relevant information, resource allocation decisions, selection of relevant strategies, and inferencing. The monitoring subcomponent includes a variety of self-assessment strategies such as ease-of-learning judgments, judgments of learning prior to beginning a task, feeling-of-knowing judg-

ments made during learning, and comprehension-monitoring judgments made during or after a task. Most theories of metamemory assume that control processes directly regulate cognition and performance, whereas monitoring processes inform the precision of control decisions. Thus, control processes are at a higher level than monitoring processes, even though both reciprocally inform one another.

### **Development of Metamemory**

A number of researchers have studied the development of metamemory, and four main conclusions can be drawn from this research. The first conclusion is that metamemory awareness is rather poor in children until the age of ten or older. Younger children frequently find it difficult to monitor the contents of memory, estimate the resources needed to complete a task, select appropriate strategies for a task, and monitor their learning. As a consequence, self-regulation is quite poor among children younger than ten years of age. Even among adults, however, metamemory awareness is poor, sometimes leading to overconfidence and illusions of knowing.

A second conclusion is that metamemory development is incremental and continuous. Development appears to be linear in nature with a steady increase in metamemory awareness, control, and monitoring from preschool through early puberty. Research generally does not reveal significant breaks or jumps in metamemory ability, suggesting continuous development over a ten-year period from early childhood through adolescence. It is less clear whether metamemory awareness continues to develop in adults, although most research indicates that awareness increases within specific domains as expertise develops.

A third conclusion is that metamemorial knowledge is self-constructed in nature through individual and interactive problem solving, as well as explicit strategy instruction and monitoring training. One essential element of the construction process is self-generated and other-generated feedback that increases knowledge of the contents of memory and tasks. A second essential element is modeling, in which an individual has the opportunity to observe and emulate skilled models. Thus far, researchers have failed to detect a strong link between metamemory and either intellectual ability or traditional measures of working memory speed and capacity. This suggests that metamemory awareness

develops independent of other individual differences in memory.

The final conclusion is that metamemory facilitates strategy use and performance. For example, correlations between metamemory and memory performance typically range from .30 to .50, even in younger children between the ages of five and ten years. The correlation may be even stronger in adults and experts. Knowledge about the contents of one's memory as well as tasks clearly should affect performance. In addition, declarative knowledge appears to be correlated with regulatory awareness. The more one knows about memory, the better able one is to regulate one's performance.

### Metamemory and Learning

Metamemory affects learning in many ways but especially with respect to the efficient use of limited cognitive resources, strategy use, and comprehension monitoring. Children and adults often experience difficulty learning because of cognitive overload—that is, too much mental work to do and too few cognitive resources at their disposal. Research reveals that declarative and procedural knowledge enables learners to use available resources more efficiently because they are better able to plan, sequence, and monitor learning tasks.

A second way that metamemory improves learning is through the flexible use of cognitive learning strategies. Research indicates that self-regulated learners use a diverse repertoire of strategies that are controlled using conditional knowledge in metamemory. Strategy use is highly correlated with skilled problem solving. Research also suggests that strategy training increases metamemory awareness, provided that conditional knowledge about the strategies is embedded within the instruction. In 1999 Roger Bruning, Gregg Schraw, and Royce Ronning provided a step-by-step summary of cognitive strategy instruction that includes feedback and modeling from peers, tutors, and teachers. Strategy instruction is especially effective for helping students develop conditional knowledge that enables them to select the most appropriate strategy and monitor its usefulness.

A third way that metamemory improves learning is comprehension monitoring. Unfortunately, many children and adults do not monitor with a high degree of accuracy. Monitoring training helps learners monitor more successfully and also im-

proves performance. Strategy instruction also improves monitoring even when monitoring instruction is not included as part of the instruction. Thus, either strategy instruction or monitoring training improve monitoring accuracy. Combining strategy instruction and monitoring training within the same intervention helps learners construct the control and monitoring subcomponents of regulatory knowledge described above.

### Classroom Implications

Metamemory research has not had a major impact on classroom instruction. The research suggests, however, that children acquire and construct metamemory knowledge in three distinct ways. One way is hands-on experience that provides declarative knowledge about tasks as well as procedural knowledge about optimal performance. A second way is through skilled models who provide detailed feedback—especially conditional feedback—that enables the student to distinguish between effective and less-effective strategies. A third way is through self-reflection and group reflection in which students explicitly discuss the effectiveness of different strategies and ways to improve performance in the future. Thus, there are many ways to improve metamemory awareness through classroom activities.

Several learning interventions have been developed that promote metamemory development and awareness. For example, in 1984 Annemarie S. Palincsar and Ann L. Brown described a program of reciprocal teaching that promotes the self-regulation of metamemory strategies. The program involves the teacher gradually handing over control of reading processes to the student in a small-group format. The teacher first models effective strategies (e.g., finding the main idea of a passage) then provides scaffolding to the students as they attempt to do the same while receiving feedback from their peers regarding the strategies they employ.

### Summary

Metamemory is knowledge about memory. Metamemory awareness develops late and incrementally yet has an important impact on memory and cognitive performance. Metamemory is not linked strongly to other cognitive factors such as intelligence and memory capacity. Rather, it develops as a function of experience, guided modeling and feedback, and individual and group reflection.

#### MYTHS, MYSTERIES, AND REALITIES

Why is it that people remember some things and forget others? How long do people remember things? What kinds of cues are likely to help a person remember a forgotten item? These are just a few of the many questions of interest to memory researchers. This entry reviews some of the important questions in the field of memory research and describes how psychologists use experimental methods to answer these questions. It also describes some of the major findings and rebuts some of the common myths about memory. This discussion is structured around the three stages of memory: encoding, storage, and retrieval.

*Encoding* refers to the intake of information and creation of a memory trace. In a typical memory experiment, the encoding phase involves presentation of the to-be-remembered stimuli, such as nonsense syllables, words, pictures, stories, films, or staged events. In real life, encoding includes all forms of perception, from watching a movie to having a conversation. Encoding may be *intentional* in that subjects are forewarned to memorize the items or *incidental* in that subjects learn the to-be-remembered material through performance of another task such as making a category judgment. In educational settings, encoding is intentional when students deliberately study the meanings of vocabulary words, learn facts for a test, or memorize a famous speech. In everyday life, however, most things are learned incidentally. Examples in the education domain include students learning about a historical period by watching films, role-playing, and reading memoirs.

*Storage or retention* refers to the maintenance of the memory trace over time. In most laboratory experiments, the retention interval is quite short and the subject does an unrelated task during that time. In the education domain, there may be a retention interval of several weeks between learning and testing; students may continue to practice the target information during the retention interval.

*Retrieval* involves later accessing that memory trace. There are many different ways to test memory. *Explicit tests* require subjects to consciously remember events from the study phase. Most educational tests are explicit; students know they are being tested and that they should remember facts from class and textbooks. Explicit educational tests include essay, short-answer, multiple-choice, and true-false tests; these roughly correspond to the laboratory tests of free recall, cued recall, forced choice, and old-new recognition. *Implicit tests* measure the effect of previous experience on a task that does not require the subject to consciously refer back to the study phase. In education, pure implicit tests are rare although many explicit tests may tap a student's implicit knowledge (e.g., essay tests implicitly test a student's knowledge of grammar). In the laboratory, there are many different implicit tests. For example, a subject who had recently seen a list that included the word *octopus* would complete the word stem "oct\_\_\_\_" with "octopus" at a higher rate than subjects who had not seen the list.

In the following sections, some of the facts and myths associated with each of the three stages of memory are described.

## Encoding

Key questions about encoding include what kinds of things are easily memorized and what study strategies can be employed to ensure later memory.

Not all materials are remembered equally well. Pictures are remembered better than words, and in general memory is better for distinctive items. Likewise, concrete words are better remembered than abstract words. Good teachers often apply this finding by using concrete analogies to explain abstract phenomena or theories, such as when the movement of gas molecules is compared to the movement of billiard balls on a pool table.

Not all study strategies are equal. In general, elaborative encoding yields the best memory. Elaboration involves going beyond the stimulus at hand

to create a richer memory trace. For example, rather than simply repeating a to-be-memorized vocabulary word, a student might think of other words similar in sound and meaning, draw a picture that somehow represents the word and its definition, or write sentences using the word in context. In perhaps the most famous laboratory demonstration of this, Fergus I. M. Craik and Endel Tulving looked at subjects' memory for words after perceptual, phonemic, or semantic processing in a 1975 study. For example, if all subjects studied the word *EAGLE*, one group decided if the word was in uppercase letters (perceptual), the second group decided if it rhymed with *legal* (phonemic), and the third group decided if it was an animal (semantic). All of these questions would have been answered affirmatively, but memory was best following semantic processing, next best with phonemic processing, and worst after perceptual processing. This is the classic levels of processing effect. The educational implication is that incidental study can be just as effective as intentional memorization. If students are studying via a semantic or other elaborative task, the resulting memory can be just as strong even if they are not forewarned about the upcoming memory test.

Encoding is not like taking pictures with a camera; not everything is recorded. Instead, encoding is selective. The levels of processing effect is an example of this; depending on the instructions, subjects directed their attention to different features of the target word. More generally, what students encode will be a function of what they already know and how well they can understand and link the incoming information to their prior knowledge. A *schema* is the term for a person's knowledge representation of a concept or domain. Without a schema, the understanding and interpretation of incoming information is difficult. For example, in a 1977 study by D. James Dooling and Robert E. Christiaansen, subjects had poor memories for such passages as "With hocked gems financing him / our hero bravely defied all scornful laughter that tried to defy his scheme / Your eyes deceive, he said—an egg not a table correctly typifies this unexplored planet." Good memory required knowledge that the upcoming passage would be about Christopher Columbus. Schemas also serve to direct a subject's attention to particular schema-relevant details and to allow for inferences. For example, according to a 1977 study conducted by James Pichert and Richard Anderson, students who read a story about two boys playing hooky and

spending the day at home remembered different things depending on which of two perspectives had been instantiated at encoding: home buyer or burglar. Subjects who read the story with the perspective of a burglar attended to and remembered better such details as that the house's side door was unlocked, a fact unlikely to be relevant to a home buyer.

Another fact about encoding is that more is not necessarily better; massed study is not a good idea. While many students choose to cram for exams the night before, the data clearly suggest that spaced study opportunities are preferable. The same holds true for rehearsal of to-be-remembered information, which is described in the next section on activities during the retention interval.

### Storage

Encoding is a necessary but not sufficient condition for later memory. As time passes, it becomes less and less likely that a person will be able to retrieve the target event. In 1985 Herman Ebbinghaus first documented the now classic forgetting function; he taught himself series of consonant-vowel-consonant trigrams and tested his memory after varying time lags. Memory dropped off quickly at first, but eventually forgetting leveled out over time to a fairly stable level. Most laboratory studies involve fairly short retention intervals; in 1984, however, Harry P. Bahrick examined knowledge of Spanish following retention intervals of up to fifty years (participants reported very little use of Spanish during that time). Again, there was a sharp drop in knowledge by three to six years poststudy, but after that initial drop, knowledge was surprisingly stable over the next twenty-five years. Bahrick termed this long-term retention the *permastore*.

Rehearsal during the retention interval aids memory; not all forms of rehearsal, however, are equal. Simply repeating a to-be-remembered item will not necessarily lead to enhanced memory. A student who writes a fact over and over will not remember that fact as well as a student who takes a more active approach to rehearsal. One of the best strategies is that of expanding rehearsal combined with self-testing. For example, the student who wants to learn a vocabulary word should not simply stare at the word paired with its definition. Rather, she should test herself and produce the definition of the word from memory; after a short delay she should repeat the process, and so on, incrementally increas-

ing the delay until the retention interval is at the desired length.

Memories do not lie dormant during the retention interval but are affected by the new information that continues to enter the system. In one classic demonstration of *interference*, subjects saw a slide show of a traffic accident involving a car passing a stop sign. In the next phase of the experiment, subjects in the experimental condition read a narrative description of the slide show that included a misleading reference to a yield sign. Control subjects also read a narrative, but it did not contain the misinformation. All subjects were later asked whether they had seen a stop sign or a yield sign. Subjects who had been exposed to the misleading post-event information were more likely to mistakenly say they had seen a yield sign than the control group. Although the exact mechanisms underlying the misinformation effect are still under debate, in at least some circumstances the misinformation works to block or interfere with access to the original memory.

### Retrieval

No single test of memory is perfect. No one test yields an absolute measure of what is in memory; rather, one can ascertain what is accessible only under a particular set of test conditions. The failure to recall part of a list is not necessarily synonymous with forgetting those words. Rather, they may be *available* in memory but not *accessible* given the current retrieval cues. When asked to write down all the words from a studied list, a subject may not be able to recall studying the word *robin*. This allegedly forgotten word, however, may be recalled in response to the category cue "birds" or correctly labeled as "old" on a test that re-presents the word *robin* for an old-new decision. Similarly, a student who is unable to produce an answer on an essay test may recognize it on a multiple-choice test.

Conclusions about memory may vary across tests. Take, for example, the effects of word frequency on memory. Following study of a word list, words that occur with high frequency in the language (e.g., *tree*) are recalled with a higher probability than are words that occur with low frequency in the language (e.g., *ecru*). The opposite result, however, is obtained on recognition memory tests. When subjects are asked to label words as "old" or "new," they do a better job with low frequency than high frequency

words. This paradox is one that continues to interest researchers.

So, how then to get the best performance possible on a memory test? The general rule is that the test should match study as much as possible. Returning to the levels of processing effect described earlier, semantic processing leads to better memory in part because most memory tests are semantic in nature. When subjects are given a phonological test (e.g., did you study a word that rhymes with *beagle*?), performance is better when words are encoded as rhymes than when they are categorized. Effects of test expectancy are nicely explained within this framework. Performance on an open-ended (essay or free recall) test suffers if students are incorrectly led to expect a multiple-choice test. Depending on which test is expected, students study differently. Students expecting a multiple-choice test focus less on relations between items and spend less time preparing than do students expecting a more open-ended test. The way students study for multiple-choice tests does not match the demands of the recall test; hence, performance suffers when students are surprised with the unexpected version of the test. A good educator will make clear the test demands early in a course so that students will tailor their study strategies appropriately.

Memory is not like a tape that can be played back perfectly at test. Rather, memory is reconstructive. In one example of this, from the 1977 study of Dooling and Christiansen, subjects read a paragraph that began “Carol Harris was a problem child from birth. She was wild, stubborn and violent.” Right before the test phase, some of the subjects were told that Carol Harris was really Helen Keller. These informed subjects were much more likely to incorrectly identify the statement “She was deaf, dumb, and blind” as having been in the original paragraph than subjects who were not informed of Harris’s true identity. Subjects made use of their knowledge at test to reconstruct what they read during the first part of the experiment. Schemas are as active during test taking as they are during encoding, and they provide retrieval cues and allow for reconstruction.

### Conclusions

There are two very general requirements for effective memory: quality encoding and appropriate retrieval cues. These principles are exemplified in a classic study method, the SQ3R method, which Francis P. Robinson described in 1970. SQ3R stands for: sur-

vey, question, read, rehearse, and review. Students begin by surveying the textbook chapter before reading it, to become familiar with its organization. As they read the chapter, they form questions that they then answer. Finally, they rehearse and test themselves on what they have just read, and review all the material repeatedly. Each of these activities links to basic memory processes. The initial survey of the chapter leads students to set up a schema for the chapter that guides both encoding and later retrieval. The questions students create serve as retrieval cues later on. Answering these questions, repeated rehearsing, self-testing, and reviewing the material are all forms of retrieval practice that will aid memory. Studying a textbook chapter need not be a mystery to students.

## STRUCTURES AND FUNCTIONS

In the study of memory there have been many metaphors adopted in the search for an explanation of the memory process. The fourth century B.C.E. Greek philosopher Aristotle compared memorizing to making impressions in wax, and the idea that memories are copies of reality that a person stores and later retrieves has been widespread. This is sometimes called the storehouse metaphor, and many of the ways in which people talk about memory (searching for memories, bringing them back from the recesses of one's mind) assume such a metaphor. The computer metaphor that has been popular with psychologists researching memory is a version of the storehouse view. It conceptualizes the stages involved in remembering in terms of encoding, storage, and retrieval in which information is entered into memory, retained, and then found again at a later time. Thinking about remembering in this way can be valuable, but it can lead to the incorrect assumption that what is remembered is a simple copy of what was originally experienced. In reality, much that is remembered captures the gist rather than the details of the original experience, and remembering is often a process of reconstruction. Examples of constructive remembering can be found in research on false memories. Elaborate and detailed false memories of events from an individual's past can be easily created. More mundanely, hearing a list of close associates to a particular word leads to recall of the word itself even though it was not presented. One alternative to the storehouse metaphor is the correspondence metaphor that emphasizes the deviation between the memory and the original experience.

### Memory Structure

Researchers who study memory use a number of terms to subdivide the enormous field. One major distinction is that between explicit and implicit memory. Explicit memory refers to the conscious recall of information. Conscious awareness of past experiences involves explicit memories. Often, however, people are influenced by experiences that are not consciously recallable. For example, the ease and speed with which a person solves the anagram *rbocoilc* depends upon how recently the person has encountered the word *broccoli*. This facilitation reflects implicit memory. Processing of new information is primed by past experiences without conscious awareness. The distinction between explicit and im-

PLICIT memory may reflect different underlying memory systems. Quite different timescales and sensitivities have been demonstrated for some explicit and implicit memory tasks. The differences may arise, however, from the processing requirements of the tasks rather than from different memory systems.

A distinction that overlaps with explicit and implicit memory is that between episodic and semantic memory. This distinction, associated with Endel Tulving, is between memory for events and memory for facts. Episodic memory is for events that people can remember happening, whereas semantic memory is for facts that people know about the world without necessarily retaining any recollection of the situation in which they learned the information. One's memory for eating breakfast on a particular morning is an episodic one, whereas one's memory that Coca-Cola is a drink is a semantic one. One area of episodic memory is autobiographical memory—memory for personal events in one's own life. Autobiographical memories from the first two years of life are very rare, while memories from the late teens and early twenties are more frequently held than the average. Certain autobiographical memories seem to be so distinct and full of the apparently irrelevant details from the original event that they have been called flashbulb memories because the nature of the memory is similar to a photograph of the moment. Archetypal examples of flashbulb memories are associated with hearing or seeing particularly dramatic events such as the assassination of a famous person or a major accident.

**Submemories.** One approach to understanding the structure of memory has been to seek separate submemories that are responsible for retaining information over differing time periods. In 1968 Richard Atkinson and Richard Shiffrin proposed a model with three types of memory: a sensory store, a short-term store, and a long-term memory. Visual information, for example, is believed to be retained for about one second in a sensory store while perceptual processing takes place. Similar sensory memories aid in the processing of acoustic and other inputs. Beyond the perceptually based sensory memories is the short-term memory, which retains information for a few seconds before selected elements of that information are transferred to a long-term memory. Atkinson and Shiffrin recognized that there were control processes in short-term memory that influence what is attended to and processed. The Atkin-

son and Shiffrin model has been elaborated into the working memory system, which has been particularly investigated by Alan Baddeley and his colleagues. Baddeley has subdivided the working memory into several subcomponents, the most heavily researched of which are the phonological loop, the visuo-spatial sketchpad, and the central executive. The phonological loop holds a couple of seconds of speech sounds and plays a role in reading. The visuo-spatial sketchpad is used in the creation of mental images and in the solution of visual and spatial problems. The central executive is a controlling attentional system that supervises and coordinates current cognitive processing.

**Formal models of memory.** A number of formal models of memory that can be run as computer simulations have been developed. Among the most influential of these are Jerome Raaijmaker's and Richard Shiffrin's 1981 SAM model, James McClelland, David Rumelhart, and Geoffrey Hinton's 1986 PDP model, and John Anderson's 1993 ACT model.

SAM (Search of Associative Memory) is a mathematical model based upon items and the strength of associations between them. It is particularly appropriate to the learning of lists of words. Each word has a memory strength as a result of it being studied, and each word has an associate strength with the other words in the studied list. The memory strength is combined with the association between the word and the context in which it was learned to produce a strength that is the basis of recognition or retrieval. The model can account for many of the memory phenomena associated with the learning of lists, but it shares with the other two formal models described here the difficulty that many of its assumptions are not based on observations and are difficult to test.

The PDP (Parallel Distributed Processing) model is a neural network model inspired by the analogy of neural circuits in the brain. The network consists of units that are connected to form a network. The strengths of the connections (weights) are adjusted as the network is trained to produce correct responses. Activation spreads through the network and the weightings direct that spread. A response is selected when it achieves a sufficient level of activation. One feature of neural network models is that memory is not located in one place but is captured by particular patterns of activation over many units and links. The neural network models are attractive in apparently simulating the structure of the brain. The choice of the particular structure of units and

their interconnections, however, turns out to be important for each simulation of human memory. A general representation that is applicable to many types of remembering has yet to be developed.

The ACT framework is a production system theory for both memory of facts and skills. Anderson has developed several versions of ACT including ACT-R (Adaptive Control of Thought-Rational). Production rules are condition-action rules of the form: *If* this is the condition, *then* execute that action. Within the system, units of information are linked by associations, with the association strength being increased through use. The ACT models were developed to account for problem solving and skill acquisition as well as memory. As with the other formal models discussed here, there are many assumptions that make a model difficult to evaluate.

### Memory Functions

What is remembered of a particular event depends upon the way in which it is processed. Elaborate processing that emphasizes meaning and associations that are familiar leads to good recall. So, for example, the word *albatross* would be remembered poorly if only the font in which it was printed was noticed and little thought was given to its meaning. It is much more likely to be remembered, however, if at the time the word is read the reader thinks about how albatrosses are white seabirds living in southern oceans. On the other hand, if what is encountered is difficult to understand, then not only will it be poorly remembered but what is remembered may be distorted by an effort to comprehend the meaning.

The processing of new information draws very heavily upon memory of past experience. Schemas have been developed for often-encountered familiar situations such as going to a supermarket or eating at a restaurant. These schemas guide understanding and memory of the new events but may also lead to memory errors by adding expected events that did not actually occur. Information that is organized on the basis of one's existing knowledge is much easier to learn and remember than is disorganized information. So, for example, a list of the names of animals is much easier to memorize if it is categorized according to type of animals (domestic, farm, wild) and if the categories are laid out in a structured way. Experts in an area memorize new information within their area of expertise much more quickly than do novices. So, soccer fans easily learn new soccer scores

and chess masters memorize real board configurations easily.

When material is restudied to strengthen the memory of it, the shorter the interval between the first and second study periods, the less the improvement in recall. This spacing effect is large, so that studying in two spaced sessions can produce twice as much recall as a single session of equal length. The rereading of factual material makes only a small contribution to the further learning of it. Testing oneself by retrieving studied material, however, is a particularly effective technique for improving memory.

What is remembered depends upon the information that is available to cue recall when it is retrieved. In 1983 Tulving summarized much research in the encoding specificity principle. This principle asserts that retrieval is successful to the extent that the cues available at retrieval match those that were processed by the learner at the study phase. The retrieval cues may be aspects of the material that was studied, but they also include environmental cues and the mood and mental state of the learner.

The learning of information that is similar creates a problem for retrieval. There is interference from similar material learned earlier (proactive interference) and from material encountered since the original learning (retroactive interference), and these reduce recall. More insidious are misinformation effects. These occur when misleading information is presented, for example, to eyewitnesses during questioning. The misleading information is then frequently recalled, and the original information becomes very difficult to retrieve.

When tested across time, forgetting follows a logarithmic curve—information loss is rapid initially but then information is lost more slowly. Nevertheless, the fate of information that has been initially very well learned is rather different. Where facts, names, or foreign-language vocabulary have been used repeatedly but are no longer regularly recalled, the pattern of their forgetting is an initial loss over a three-year period, after which recall may be equally good with delays of one or twenty-five years.

## MENTAL HEALTH SERVICES AND CHILDREN

---

It is estimated that the percentage of children and adolescents in the United States who are in need of mental health services is between 15 and 20 percent. This means that more than 10 million children in the country suffer from some mental disorder. It is also estimated that 3 to 8 percent have a serious mental illness. More children suffer from psychiatric illness than from leukemia, diabetes, and AIDS combined. There are also both short-term and long-term financial and emotional costs associated with these disorders.

Determining which children need mental health services is a complex undertaking. In most cases, a youth has to receive a mental health diagnosis from a qualified clinician. The American Psychiatric Association, in their Diagnostic and Statistical Manual (DSM), has codified diagnostic categories. Researchers may use a structured clinical interview, such as the Diagnostic Interview Schedule for Children (DISC), to obtain a diagnosis, but these rigorous instruments are rarely used in clinical practice, and there is little agreement among clinicians in their use as a diagnostic tool. In addition to meeting the criteria for a diagnosis, federal regulations now require that for a child to be classified as having a *serious emotional disturbance* (SED) the child must have a functional impairment in two or more areas. These areas include home, school, and work (where relevant).

### Who Receives Mental Health Services?

Children can receive mental health services from several sources, including schools; mental health institutions such as hospitals; community mental health centers; mental health services provided through child welfare; services from juvenile justice; and primary care physicians. Estimates of use of mental health services by children range from 1.9 to 6 percent in any given year for the general population. Most children receive services from schools.

There are several factors that are related to an increase in the probability in accessing mental health services. In two studies comparing a system of care that offered a full range of services with the more typical community services, such as those provided by community mental health centers, children were more likely to receive services, and to receive more services, in a system of care. (A system of care includes a continuum of services from outpatient to hospitalization, coordination or management of these services, and, usually, the involvement of multiple child-serving agencies.) However, the provision of services in a system of care was more expensive and was not any more effective than the usual services available in the community.

### Use of Services

Patterns of service use are not well understood, but it is generally agreed that services are underutilized by youth. There are several possible reasons for this, including the stigma associated with such services and parental dissatisfaction with services. Most children do not enter services willingly, and it should be recognized that specialized children's mental health services alone will never be sufficient to meet the need for mental health services. More services will have to be provided by other systems, such as schools and the juvenile justice system.

There is a high dropout rate of children from services, although estimates vary considerably. Some studies have found that 40 to 60 percent of children who begin treatment terminate it before the therapist recommends they should terminate. It is believed that the majority of children attend outpatient treatment for only one or two sessions. It is not clear why the dropout rate is so high, but it is suspected that referral to services are often made by others, such as schools, and not the parent or adolescent.

### Where Do Children Receive Mental Health Services?

**School systems.** Schools usually identify children with mental health problems only after the problems have not been successfully dealt with by their classroom teacher or their parents. However, once identified, students are much more likely to use the services in the schools than in the community. Schools usually try informal interventions before referring a child to special education. A federal law, the Individuals with Disabilities Education Act (IDEA), requires that such children be evaluated and, if eligi-

ble, placed in a special classroom or provided with special assistance in their regular classrooms.

There is a strong relationship between SED and several measures of school performance. Students with SED have lower grades, are retained more often in grade, and fail more courses than other students with disabilities. Less than half (42%) of children with SED graduate high school, as compared to 56 percent of students with other disabilities and 71 percent of all students. The rates of identification of youth with SED vary across racial, gender, and socioeconomic lines, with Hispanics and Asian Americans receiving proportionally the least amount of services. Research also suggests that students from low socioeconomic backgrounds and males are over-represented among those identified with SED.

Schools are not good at identifying children with mental health problems. There are several reasons for this difficulty, including the avoidance of stigma, lack of training in recognizing mental health problems, and the desire of the system to avoid the costs of mental health services. There is not a substantial amount of evidence that schools are successful in treating children with mental health problems. Comprehensive support systems and training for teachers and administrators are not typically found in school systems.

Recent trends in SED lead to one of three possibilities: (1) the number of children with SED is increasing, (2) schools are recognizing more children with SED, or (3) both of these are occurring. Since 1976 there has been an increase of more than 118,000 students with SED (a 48% increase) receiving services under the Chapter 1 Handicapped program of the Elementary and Secondary Education Act (ESEA) and IDEA Part B programs. However, this program ended in 1994.

As in other service sectors, there are a significant number of children who are not receiving needed services in the schools. In addition, little is known about the quality, appropriateness, or effectiveness of the services delivered to children and adolescents in schools.

**Primary care.** Pediatricians and primary-care physicians prescribe most of the psychotropic drugs prescribed for children. They may also counsel families, but some studies indicate that families do not interpret this counseling as mental health services. For preschool children such visits may be their only contact with a health delivery system. Studies have

shown that physicians often fail to identify children with mental health problems. Moreover, parents often fail to mention that their child has a problem. There are several barriers to proper identification and the delivery of effective services—physicians are not trained to deal with mental health problems, the service may not be reimbursed at an attractive level, and the average visit to the doctor is only eleven to fifteen minutes long.

**Juvenile justice.** The magnitude of mental-health-service needs far exceeds current resources in the juvenile justice system. It also appears that children of low socioeconomic status populate the juvenile justice system, and thus are less likely to receive mental health services because they are in the juvenile justice system. Findings show that mental health placements are rarely used relative to other court outcomes (i.e., dismissal, probation, or other types of placements), and that gender and race significantly influence whether a child will receive a mental health service. Females are more likely to receive mental health services than males, and white delinquents are more likely to be placed in a mental health setting than black offenders, regardless of gender.

### The Effectiveness of Mental Health Services

Providing ineffective services to children and adolescents would clearly not be good public policy. It would simply waste resources and not result in any improvement in child outcomes. Moreover, it would provide the illusion that society is intervening in a positive manner and thus inhibit change. For this reason, determining the effectiveness of services is a key goal in this field. A distinction should be made between the *efficacy* of an intervention and its *effectiveness*. Efficacy studies examine a treatment under optimal situations. These studies are likely to take place in a university-based laboratory using well-trained and supervised clinicians and children who are selected to meet the needs of the study. For example, a study of the treatment of depression would screen out all children who had depression *and* other comorbid mental health disorders; only children with depression alone would be studied.

Standing in stark contrast to efficacy research, effectiveness studies evaluate the effects of treatment in typical conditions. Studies of effectiveness are conducted in community mental health centers and in real-world settings such as schools. In these studies the investigator does not have the same level

of influence on which types of children get into the study, how the therapists are trained and supervised, and how carefully they follow the treatment approach. The distinction between efficacy and effectiveness is important because each type of study tells a different story about how beneficial mental health services for children and adolescents are.

Although efficacy research is important in establishing the potential utility of treatments, these studies are not very informative about how the intervention will operate in the real world. While there are hundreds of efficacy studies of psychological child and adult treatments, there are only a handful of effectiveness studies. Meta-analytic studies of treatment (mostly psychotherapy) show that, on average, mental health treatment is very powerful when studied under laboratory-like conditions. However, the picture is different for effectiveness studies.

Most effectiveness research has been done on such system-level constructs as service coordination and access. There have been few studies of the child and family outcomes of mental health treatment. These studies have not found that treatment makes a difference in child and family outcomes. For example, the Fort Bragg Evaluation Project, the largest study of mental health systems of care, found that children in a system of care had increased access to services compared to children receiving treatment as usual in the comparison sites. However, both groups improved over time and the clinical and family outcomes did not differ between the two groups. Unfortunately, the system of care was much more expensive and thus could not be justified. Research in this area is in its infancy; only more research in the real world will lead to an understanding of the conditions under which mental health treatment is effective.

The contrast in findings between efficacy and effectiveness studies is dramatic. It is suspected that a major reason for the weak effects found in the community is that practitioners are not using effective treatments. To encourage the use of effective treatments, several professional groups are identifying what they describe as evidence-based treatments. These treatments typically have sufficient efficacy results to warrant their use. Some organizations, such as the American Pediatric Association and the American Academy of Adolescent and Child Psychiatry, have developed diagnosis and treatment guidelines that are less specific than evidence-based treatments

that are spelled out in treatment manuals. However, just informing practitioners about the existence of evidence-based treatments is not sufficient for practitioners to adopt those practices. It is not clear that these techniques can be transferred to the real world, or that practitioners will use them. It is also uncertain if the guidelines are specific enough to make a difference in outcomes.

There are several reasons why these efficacious treatments are not being used in clinical practice. First, there is no agency in the behavioral field similar to the Food and Drug Administration that certifies medications as safe and effective. This means that there is no central authority that approves the several hundred existing behavioral treatments. There are few advantages for the already overworked clinicians to make significant changes in their practices and to incur the costs of additional training in evidence-based treatments. New research is focusing on how to encourage service providers to use new treatments.

### **Medication**

Progress has been made in the use of medication to treat several disorders, including attention deficit hyperactivity disorder (ADHD), obsessive-compulsive disorder (OCD), and childhood anxiety disorders. In addition, studies are underway to test the effectiveness of medication for major depression. Clinical trials are also being started for bipolar disorder, autism, and several other mental disorders.

A major study on ADHD found that medication was more effective than behavior therapy for symptom reduction. However, combining medication and behavior therapy was more effective for children who had co-occurring disorders such as anxiety and ADHD. Furthermore, this study found that medication was more effective when managed by the study investigators than when medication was managed by physicians in routine community care. The investigators think that the greater effectiveness under the more controlled conditions was related to the higher frequency of office visits, their longer duration, and the more carefully controlled dosage.

One of the problems in using medications for the treatment of mental disorders in children is that the Food and Drug Administration (FDA) has not specifically approved most psychotropic drugs for use with children. While it is legal and ethical to use medications tested on adults on children, this “off-

label” use means that physicians do not have research findings to guide their treatment decisions for the majority of psychiatric problems. An additional problem with medication treatment is that many severely ill children are treated with multiple drugs simultaneously. There are no systematic studies of the effects of polypharmacy, and thus the effects of combinations of medications are not known.

## MENTAL RETARDATION, EDUCATION OF INDIVIDUALS WITH

Throughout history, the definition, diagnosis, terminology, and etiology of mental retardation have changed, influencing services, policy, education, and prevalence.

### Definition and Prevalence of Mental Retardation

*Mental retardation* is a condition of substantial limitations in intellectual functioning that impacts performance in daily life. Its diagnosis includes three

criteria: concurrent, significant limitations in both intelligence and adaptive skills that begin in childhood (birth to age eighteen). The American Association on Mental Retardation’s (AAMR’s) 1992 definition specifies limitations of two or more standard deviations in intelligence (IQ of 70 to 75 or less) with coexisting deficiencies in two or more of ten adaptive skills: communication, self-care, home living, social skills, community use, self-direction, health and safety, functional academics, leisure, and work. These individuals range broadly in functioning, depending in part on the degree of limitations but also on the services and support received. Individuals with severe and multiple disabilities are considered a small subset of this population. Most persons with mental retardation are capable of achieving self-sufficiency. A 1998 study indicates that prevalence estimates cluster around 1 percent, with a high of 2 percent.

### Brief History of Education

Prior to the 1700s, those with mental retardation suffered greatly. In the 1700s to the late 1800s, they entered an optimistic period when French educational methods spread to other Western countries. These methods derived mainly from Edward Seguin and less so from his predecessor Jean-Marc Itard in the first half of the nineteenth century. Seguin called his educational methods *physiological education*, which consisted of three components: muscular or physical education, education of the senses, and moral treatment. The goal of Seguin’s method was independence grounded in relationships with other citizens, not isolation from society. These educational methods produced uneven results and were followed by disillusionment.

In the late 1800s to the 1960s there was widespread building of institutions to house individuals with mental retardation. Intelligence tests, developed in the early 1900s, became the tools of the eugenic movement—a period when many people with low intelligence were sterilized under the assumption that the population would be improved. Starting in the 1970s the institutional population in the United States was gradually reduced, primarily because of a reduction in admissions. Many former residents were relocated to smaller community-based settings, but others remained in their natural homes with services and supports provided. Of those remaining in state institutions at the end of the twentieth century, persons over forty with profound

mental retardation and multiple disabilities dominated the population.

### Schools' Responses and Goals and Methods of Teaching

Before 1975 when the Education of All Handicapped Children Act was passed (Pub. L. 94-142) and special education was required, some students with milder mental retardation attended school until they failed or quit, but others with greater support needs attended parent-operated schools or remained at home. The number of individuals with mental retardation in institutions reached its peak in the mid-1960s, where educational services of widely varying quality sometimes existed. According to the U.S. Department of Education's statistics, at the end of the twentieth century students with labels of mental retardation who were enrolled in U.S. public schools constituted 11 percent of all students with disabilities. The number of students classified as having mental retardation declined substantially since the 1970s, in part because of the label's stigma and recognition of intelligence test inaccuracy. Minority children were overrepresented in school programs serving those with mental retardation, a fact often accounted for by inaccurate testing.

The primary goal of education for this group is to increase self-sufficiency by teaching functional academics and other skills needed in everyday life across home, community, work, and leisure domains. Depending on the student's abilities (conceptual, social, and practical), needs for support (intermittent to pervasive), and school placement, the educational focus and methods will vary. The socioeconomic level of the community influences the quality of special education and the amount of support an individual receives in school and during adult life.

### Trends, Issues, and Controversies

Although the label of mental retardation brings services, it also brings stigma and low expectations. The reduction in students labeled as mentally retarded (with a corresponding increase in those with learning disabilities) from the 1970s to the 1990s serves as evidence. Parents and educators have grappled with this issue. Some believe the label should be reserved for those with organic etiologies, assuming the smaller group would be more homogeneous. Others propose a change in the label and improved education of the public.

Current law requires education in the least restrictive environment with appropriate services and support. Students with mental retardation have a poor record for being served in general education classrooms: 46 percent of all students with disabilities are so served compared with 12 percent of those with mental retardation. Many believe that educators need to understand better how to serve these students in the mainstream and also equip them for the transition to adult life.

## MENTORING

---

Schools that provide mentoring programs assign a veteran teacher to act as adviser, teacher, and coach to beginning teachers within their schools. Some have defined mentoring as “a formalized relationship between a beginning teacher and a master teacher (mentor) that provides support and assesses teaching skills” (Education Commission of the States website). Others use the terms *buddy*, *coach*, and *master teacher* to describe the person who helps the beginning teacher develop into a seasoned veteran.

Often mentoring programs are just one strategy of full induction programs designed to ease the transition of the new teacher into the profession of teaching. Within an induction program, schools develop structured activities to help orient new teachers to the system and assume the roles and responsibilities of practicing teachers. Induction programs are typically comprehensive programs that guide new teachers through their beginning years in the school. Induction programs are often seen as a process lasting from one to three years. Within the induction program, the mentorship puts the focus on the relationship between the new teacher and mentor; the mentor is charged with assisting and supporting the new teacher as he or she transitions from student teacher to teacher of students. Many believe mentoring to be an essential component of the induction program.

The roles and responsibilities undertaken by the mentor vary from program to program. In all cases, however, it is the mentor who plays an essential role in achieving the goals of the induction program. Using strategies such as consultation, demonstration, and observation, the mentor can act as the primary source of assistance for the new teachers.

A mentor is defined as simply a veteran teacher assigned to a new teacher. *Veteran* means that the teacher is not in his or her first year of teaching; however, the number of years of experience is not necessarily specified. Typically, mentors have at least three years of experience in their school district or division that allows the mentor to develop an expertise and understanding about the school system and to become skilled and comfortable within the classroom. Mentors may or may not have classroom teaching responsibilities at the same time that they act as mentors. In some cases, mentors may have been relieved of teaching assignments and act solely

as mentors. Occasionally schools entice retired teachers back into the schools to act as mentors.

Mentors assist their new teachers in a variety of ways. It is the school district’s duty to define the roles and responsibilities of mentors. One way is to assist neophyte teachers to become acquainted with their new environment. Mentors might provide a tour of the facilities, introduce the new teacher to staff and faculty, describe procedures and policies of the division, explain grading philosophies, and offer suggestions for lessons and classroom management. In the work of Sharon Feiman-Nemser and Michelle Parker, mentors who assume these duties are called local guides.

Others envision the responsibilities of the mentor as going beyond those acclimation duties. In such cases, the mentor fulfills the necessary orientation responsibilities and then moves the conversations to the next level. These mentors talk with their new teachers about instructional issues and their effect on student learning. They help the new teachers reflect on their performances and decisions so that improved student learning is the outcome. A label applied to mentors fulfilling these roles is *educational companion*.

Finally, Feiman-Nemser and Parker have identified another role that mentors can adopt: that of change agent. Mentors as change agents seek to establish a new culture within a school—one of collaboration and commitment to continual professional development. This role transcends the typical role of assisting new teachers. In this case mentors attempt to break the traditional “closed-door” culture within schools and affect change throughout a system. Regardless of the role, how mentors assist new teachers is the prerogative of the school district.

### Rationale for Mentoring

School districts are faced with a myriad of problems. Not the least of those problems is ensuring that all children are taught by competent and qualified teachers. This is a growing concern in the early twenty-first century. It is anticipated that over two million new teachers will be required to fill the classrooms of America by 2012 because of mushrooming enrollments, teacher attrition, and massive retirements among the aging population of current teachers. The job of a teacher is not an easy one. Districts and divisions are looking for ways to acknowledge the demands of the job and offer support to

those who accept the challenge. Mentor programs, a promise of support, are one benefit that school districts can offer.

Filling the demand is not the sole issue, however. Even if school districts could find the sheer numbers of teachers needed, retention of these new hires becomes a problem. It is estimated that 30 percent of new teachers do not return to the classroom after their first year. Over the first five years, 40 percent leave the profession. In many cases, those leaving are the most academically talented teachers. Furthermore, new teachers are more apt to leave schools with the greatest need, leaving children to experience a succession of new teachers. Such high-need schools include those in urban settings and the rural countryside.

Many new teachers cite the feelings of isolation and lack of support as critical determinants in their decision to leave. Teaching is one of the few professions whereby a new graduate is expected to perform as fully as a seasoned professional does. Other professions such as medicine offer supervised internships and residencies that allow the new graduate an opportunity to practice with guidance from a veteran. Education, to date, rarely provides such experiences. The educational tradition of “sink or swim” that often leaves the new teachers on their own to discover what works and what doesn’t is no longer a viable option for schools.

### **Extensiveness of Mentoring Programs**

Information about the role of mentoring programs that support new teachers during their first years is not well documented. In 1996 the National Center for Educational Statistics published data regarding the participation of new teachers in induction programs. Although specific information about mentoring programs is absent, some encouraging trends are seen. For the 1993 to 1994 school year more than half (56.4%) of all public schools teachers with three or fewer years of experience were involved in induction programs. This is an increase of 39 percent from new teachers involved in induction programs of the 1980s. The National Center for Educational statistics for 1999 to 2001 data are expected to indicate that more new teachers were involved in induction programs.

In fact, induction programs are blossoming all over the country as one strategy to support teachers in their transition from student teacher to profes-

sional teacher. Data released in 2001 indicates that thirty-three states have written beginning teacher induction statutes; twenty-two of the states mandate and fund the programs. In addition, assigning mentors to assist the new teachers is often a component of induction programs. Twenty-nine states include mentorships as part of the induction process according to data published by the American Federation of Teachers in 2001.

### **Issues and Controversies**

As mentoring programs develop to help new teachers transition from student teacher to classroom teacher, questions, issues, and debates begin to surface as well. One such issue centers on the question of purpose; a second issue focuses on effectiveness.

For many years mentoring programs were defined as vehicles to support and assist new teachers as they began their teaching careers. This assistance and support was based on the trusting relationship that developed between the mentor and new teacher. Much of the trust came from the defined role that mentors were there only to assist and support, not assess. New teachers felt comfortable exposing their concerns and problems to the mentor because the mentor was there to help. The argument was that if mentors evaluated the new teachers, then the new teachers would not come to the mentors with problems and concerns. Trust would be violated and the purpose of the mentoring programs defeated.

In the early twenty-first century some are questioning the separation of assistance and assessment. Given the intimate role mentors play in the lives of new teachers, mentors may possess critical information about the quality of the new teachers’ skills and knowledge. Such information should not be absent from a comprehensive evaluation of the new teachers. The ultimate purpose of mentoring programs is to ensure quality teachers for every child; therefore, the argument is that mentors should provide evaluative data that are used in the decision of continued employment.

The general feeling, however, is that most mentoring programs embrace the concepts of assistance and support, leaving evaluation to those outside the mentor role. A small number of programs are combining assistance and assessment, however, so the verdict is still out as to which approach works best.

A second issue being explored is the effectiveness of mentoring programs. How should mentor-

ing programs be evaluated to determine their effectiveness? During the last wave of mentoring programs in the early 1990s, the effectiveness of mentoring programs was usually framed around the perceived benefits to the participants. New teachers felt the mentors were helpful; mentors perceived their roles as effective. What is needed and being pursued are more empirical data that indicate mentoring programs are responsible for the goals they strive to achieve. Typically mentoring programs identify one or more of five common goals: (1) to improve the skills of new teachers, (2) to acclimate the new teacher to the culture of the school and community, (3) to provide emotional support, (4) to retain quality teachers, and (5) to meet state mandates and requirements for licensure. Data need to be collected that identify the ways in which mentoring programs' features and practices achieve these goals. Specific correlations between what mentoring programs do and what goals are achieved would allow schools to incorporate practices and features designed to succeed. These are the avenues for future research.

## METACOGNITION

*See:* LEARNING TO LEARN AND METACOGNITION.

## MICROTEACHING

Microteaching is a scaled-down, simulated teaching encounter designed for the training of both preservice or in-service teachers. It has been used worldwide since its invention at Stanford University in the late 1950s by Dwight W. Allen, Robert Bush, and Kim Romney. Its purpose is to provide teachers with the opportunity for the safe practice of an enlarged cluster of teaching skills while learning how to develop simple, single-concept lessons in any teaching subject. Microteaching helps teachers improve both content and methods of teaching and develop specific teaching skills such as questioning, the use of examples and simple artifacts to make lessons more interesting, effective reinforcement techniques, and introducing and closing lessons effectively. Immedi-

ate, focused feedback and encouragement, combined with the opportunity to practice the suggested improvements in the same training session, are the foundations of the microteaching protocol.

Over the years microteaching has taken many forms. Its early configurations were very formal and complex. Real students (typically four or five) were placed in a rotation of teaching stations in a microteaching clinic. Teachers would teach an initial five to ten minute, single element lesson that was critiqued by a supervisor. The teacher would have a brief time to revise the lesson and then reteach the same lesson to a different group. In later years these sessions were videotaped. Videotaping microteaching lessons became the optimal practice because it allowed teachers to view their own performance.

Microteaching soon spread to more than half of the teacher preparation programs in the United States, and to other parts of the world. Though successful, its complexity overwhelmed its effectiveness as a training device and its use declined over the following decades.

### **The New Microteaching: Simplified**

In the late 1980s and 1990s microteaching was reinvigorated with a completely new format developed in southern Africa and later in China. Because of the lack of available technology in developing countries, microteaching's format had to be made less technology dependent in order to be useful. Early modifications were made in Malawi, but it was in Namibia and China where microteaching was completely transformed.

Twenty-first-century microteaching increases training effectiveness using an even more scaled-down teaching simulation environment. The new microteaching format was primarily shaped as a response to in-service teacher education needs in Namibia, where the vast majority of teachers were uncertified and there were few resources with which to train them. In China it became part of a national effort to modernize teaching practice. Three important new concepts were incorporated:

1. Self-study groups. Teachers rotate between the roles of teacher and student, building on earlier versions of "peer microteaching." Self-study groups of four or five teachers have become the norm.
2. The 2 + 2 evaluation protocol. In earlier versions of microteaching, rather elaborate

observation protocols had been developed to evaluate performance for each teaching skill. In the new microteaching, each new skill is introduced to trainees in varied combinations of face-to-face training sessions, multimedia presentations, and printed materials. These training materials give cued behaviors to watch for and comment on in the accompanying microteaching lesson. After a microteaching lesson is taught, each of the teachers playing a student role provides peer evaluation of the teaching episode using the 2 + 2 protocol—two compliments and two suggestions. Compliments and suggestions are focused on the specific skill being emphasized, but may relate to other aspects of the lesson as well.

3. Peer supervision. Originally the microteaching protocol required the presence of a trained supervisor during each lesson. However, with minimal training the compliments and suggestions of peers can become powerful training forces. Trainees feel empowered by the practice of encouraging them to evaluate the compliments and suggestions they receive from their peers (and supervisors, when present), allowing them the discretion to accept or reject any or all suggestions. On average, about two-thirds of the suggestions are considered worthwhile and suggestions from peers and trained supervisors are about equally valued.

The new, simplified format—widely used in the United States as well as abroad in the early twenty-first century—also makes it easier to incorporate the full, recommended protocol of teaching and reteaching each lesson for each student. The microteaching experience goes well beyond the formal, narrow training agenda. The gestalt experience of planning and executing a brief lesson that is closely monitored and scrutinized and the offering and receipt of feedback from respected peers is an integral part of the experience. In the present format students often have three or four complete microteaching cycles in a single course. More cycles tend not to be well received by students, as the training format seems to break down after about four cycles. Some in-service training programs have received enthusiastic reception from students for periodic microteaching sessions (one session each term or semester) over an extended period of time.

The flexibility of allowing each microteaching self-study group to make its own schedule, find its own location, and organize its own training and feedback procedures becomes an important part of the training experience. This leads to substantial savings of resources and allows the number of scheduled sessions to be determined by academic merit, not resource limitations.

### Variants of Microteaching

Over the years many microteaching clinics have made modifications in the basic training protocol that detract from the effectiveness of microteaching training, but are thought necessary, given the constraint of resources. Some of the most frequent of these modifications includes greatly increasing the size of the microteaching class. Sometimes an entire class of twenty to thirty-five students is used as the microteaching class. This is necessary for scheduling reasons and because of the lack of facilities and staff for multiple, simultaneous sessions. This adaptation requires students to be passive learners for large numbers of lessons as each trainee has a turn to teach. The number of students in each class means that students teach very infrequently, often only once, and usually have no opportunity to reteach.

Another adaptation is the use of longer lessons, often fifteen or twenty minutes in length, because it is difficult to fit some lesson concepts into a five-minute lesson. This difficulty results from a lack of understanding of a single lesson element. A typical lesson will combine multiple concepts within the same topic, yet teachers often are not trained to break down their lessons into individual concepts. Identifying single concepts and planning a single concept lesson is itself an important skill. Microteaching is well suited to help teachers identify single concepts and learn how to create learning modules from which longer lessons can easily be constructed. Longer lessons in microteaching greatly increase the complexity and duration of training sessions, reduce the number of sessions possible for each individual trainee (unless the length of training is increased), and tend to cause the training sessions to lose focus. Microteaching research at Stanford University repeatedly showed that a five minute lesson is sufficient for the practice of many useful teaching skills in all subject areas.

The development of elaborate microteaching facilities, sometimes with permanent installation of multiple cameras, one-way glass partitions, and even

audio capability at each student desk, has been another development. Though very well intentioned, such clinic facilities have not proven cost-effective for the widespread use of microteaching. These facilities are even more personnel intensive. Often special technicians are assigned along with a supervisor/proctor. These facilities would be more effective if the videotaping capacity was entrusted to students, thereby reducing the cost. The ideal would be for one out of every three or four sessions to be videotaped with a simple, one-camera setup with the opportunity to view the lesson immediately. When videotaping is not available and lessons are not taped, the training results have been found to be quite acceptable, though not optimal.

### Microteaching Models of Teaching Skills

Microteaching can be an effective tool for the development of teacher training materials. When training protocols are being created to demonstrate new teaching skills, microteaching sessions can be developed and taped giving instances and non-instances of the skill. Asking trainees to view these tapes together is an effective way to highlight and demonstrate the essential aspects of the skill being taught.

### Microteaching Courses

Microteaching has been developed as a course in many teacher-training institutions around the world. It readily combines theory with practice. When one considers that teacher trainees in many training programs do their practice teaching under inadequate supervision with no student feedback, the relative merits and economy of microteaching become more and more apparent. Microteaching offers the advantages of both a controlled laboratory environment and realistic practical experience. It is hardly a substitute for teaching practice, but it offers advantages such as close supervision, manageable objectives established according to individual trainee needs and progress, continuous feedback, an unprecedented opportunity for self-evaluation, immediate guidance in areas of demonstrated deficiency, and the opportunity to repeat a lesson whenever desired. When these advantages are combined with the economy of resources required to obtain them, microteaching becomes a valuable training method under many conditions throughout the world.

## MIDDLE EAST AND NORTH AFRICA

---

This entry provides an overview of the status of education in the Middle East and North Africa (MENA) region. It contains both statistically based assessments of individual countries as well as a discussion of the overall factors that are currently affecting the level of and accessibility to primary, secondary, and tertiary education. Current and future systemic challenges are also exposed, and possible solutions from similar case studies are advanced.

### Regional Background

Depending upon the scope, origin, and purpose of study, the MENA region can include the countries of Algeria, Bahrain, Djibouti, Egypt, Iran, Iraq, Jordan, Kuwait, Lebanon, Libya, Malta, Mauritania, Morocco, Oman, Qatar, Saudi Arabia, Sudan, Syria, Tunisia, the United Arab Emirates (UAE), Yemen, and West Bank-Gaza. (While the State of Israel is geographically located within this region, this article focuses on those countries that are classified as Arab through their common usage of and reliance on the Arabic language [except Iran, where Farsi is predominant].) For the purposes of this article, MENA includes all of the above, except Malta, Djibouti, Mauritania, and Sudan. Although the region is bound, to a large extent, by the prevalence of the Islamic religion and the commonality of Arabic as a language, it is diverse in ethnicity, tradition, history, and spoken Arabic. As a region it has a population of more than 295 million that reflects diversities in social stratification and economic development ranging from the high-income, oil-rich countries of Kuwait, Qatar, and UAE to the low-income countries of Egypt and Morocco.

Owing to rising oil revenues in the 1970s, oil-producing countries underwent a major economic boom that resulted in a tremendous expansion in social services, construction, and basic infrastructure.

Non-oil-producing countries such as Jordan, Morocco, and Tunisia also benefited from the influx of capital by exporting their human capital in the form of professional and lay labor. According to the World Bank, from the early 1970s to the late 1990s, MENA grew faster than any other region except East Asia.

Because of the emphasis placed on upstream and downstream oil production, revenues from these activities continue to be the dominant generator of funds throughout MENA, and the central government became both the storehouse and distributor of these funds. As such, governmental social ministries were created to disperse, invest, and manage these appropriations as it deemed fit, with little or no initial studies and a deficit of long-term planning and analysis. In part, this is due to the general receptivity of centralized planning and manpower forecasting that was dominant in the 1950s. Manpower forecasting makes the assumption that a nation can reasonably predict its human capital requirement based on its potential growth rate and its developing infrastructure. While this method may provide viable predictions for a country that has a measured growth rate from a diverse and sustainable resource base, it is less reliable for single-resource-based economies, especially those that experience tremendous revenue variations from the single main resource. Given these conditions, governments in the MENA region initiated and managed revenue streams that fed into industry, agriculture, and social services.

Because of these factors, the countries of MENA continue to experience fluctuations in economic performance (see Figure 1), resulting in a region that exhibits an overall low economic growth rate, rising populations, sporadic civil unrest, and a lack of regional transparency and cooperation in many governmental areas, not excluding education. Governments that in boom years had ingested most of its graduates in swelling public-service sectors, find themselves each year with a growing number of graduates who expect their government to offer them an encompassing position in perpetuity—not only a job, but a lifelong career. While there are movements throughout MENA to “nationalize” positions that once were held by expatriates, it is logical to predict that the public sector will eventually build to capacity and the private sector will need to alleviate this influx of human capital.

Oman, for example, employs most of its workforce in public service, but the state can no longer offer positions for the nearly 30,000 Omanis who enter the workforce annually. As a result, the state mandated that financial and banking corporations begin hiring from the national base. The swelling numbers mean that other private sectors will also need to be included. It is also important to note that if an educational system were training its workforce at submarket levels, a rapid nationalization would have a negative effect, resulting in falling productivity, output, and national income. Although some of the questions concerning nationalization of public and private enterprise are beginning to find answers, the deeper question remains: How are the state-driven educational systems going to enable the workforce to compete on national, regional, and global levels? (See Figure 2.)

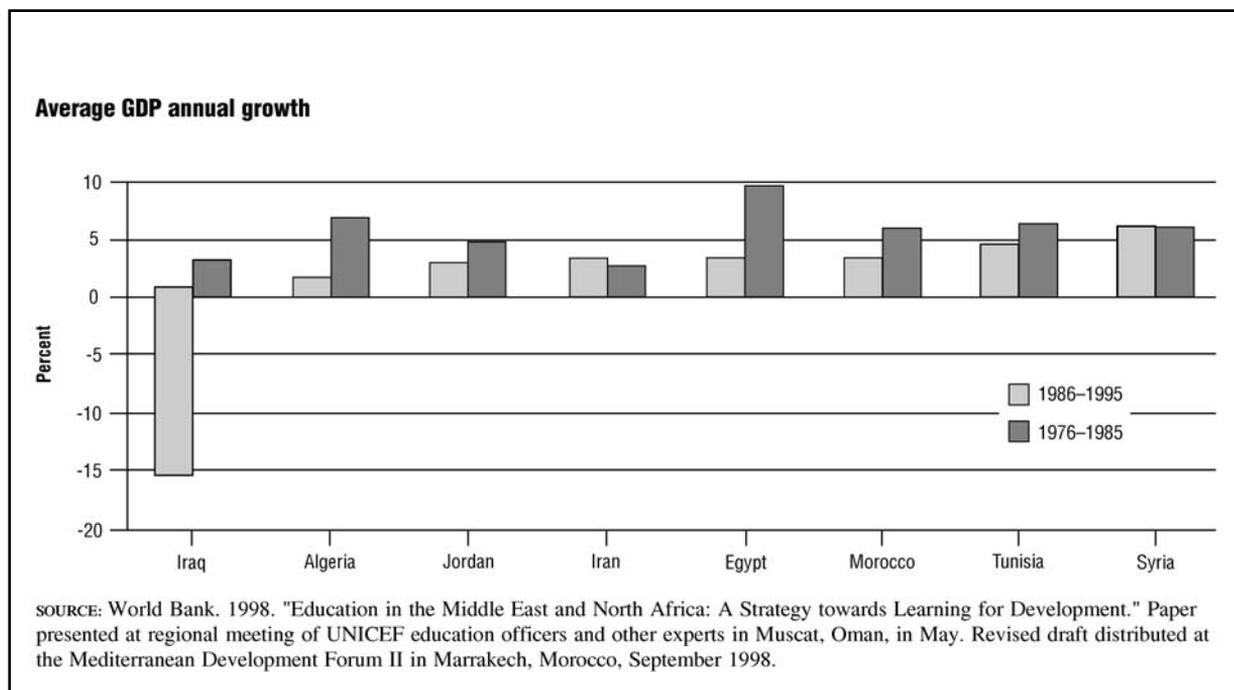

### Educational Perspective

To understand the scope of the problem, it is important to study some of the weak points in the implementing of the educational system.

**Access, literacy, and equity.** In a regional comparison, MENA accounts for only 0.1 percent of the global expenditure on research and development, which is lower than that of every other region except Sub-Saharan Africa. While there is a considerable lack of regional cooperation, there is also a weak communication network that impedes the transfer and flow of knowledge, with fewer than fifteen main telephone lines per 100 people in urban settings and fewer than five lines per 100 people in rural environments (see Figure 3). This is less than 65 percent that of the Europe and Central Asia region and less than 25 percent that of the nations of the Organisation for Economic Co-operation and Development.

Because all countries operate from a fixed budget and most countries have several ministries that serve the different levels of education, there is competition between ministries for prominence and funding (see Table 1). This leads to a number of questions, including: If funding for primary education is increased, which ministry is willing to suffer a reduced budget and by what amount? Within the continuous cycle of education, how is it feasible to diminish one level of education without compromising the remaining levels? Furthermore, with the inherent nature of the accelerating and steep learning curve of the technology in the global market, how will educational ministries be able to secure

FIGURE 1

higher funding within countries whose economies are already strapped?

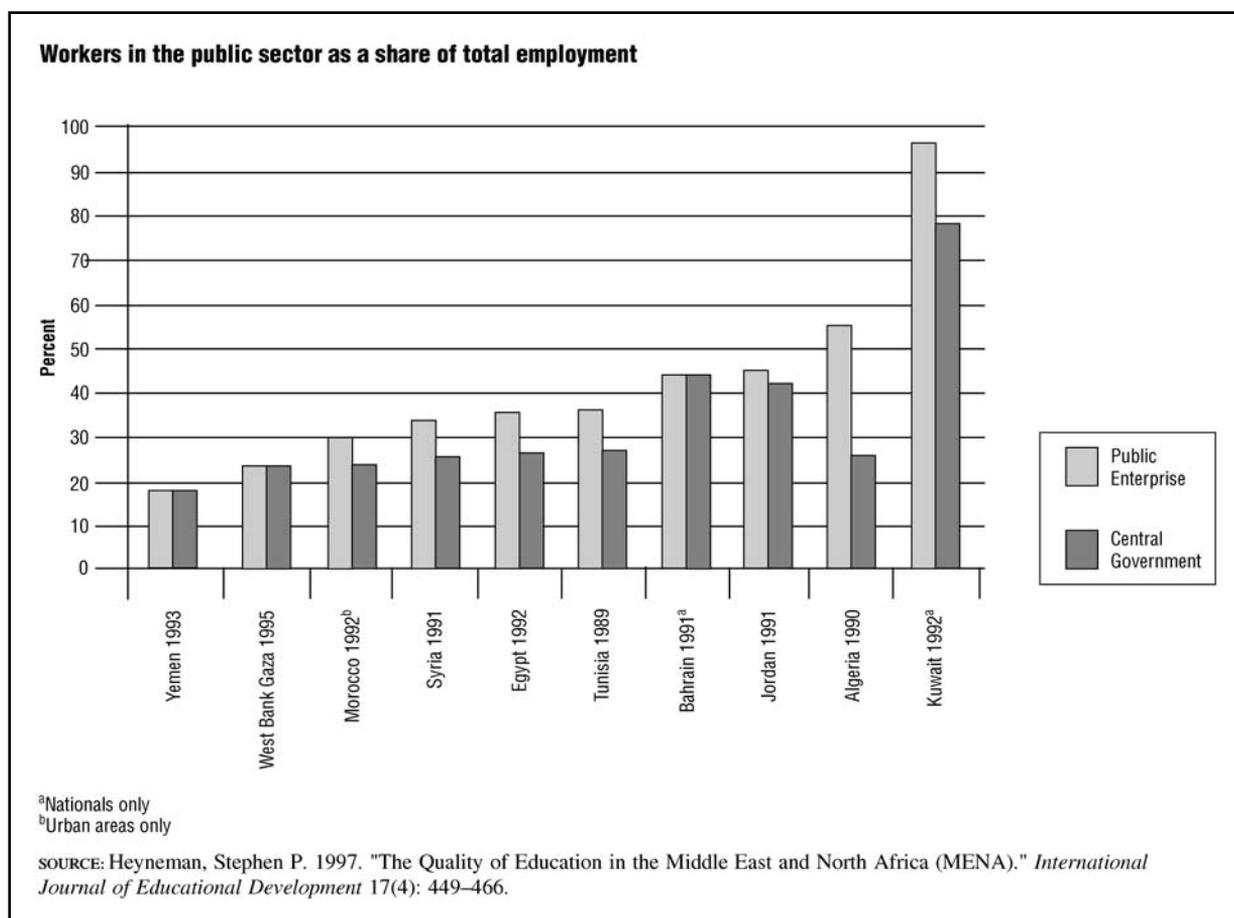

In 1960 a large percentage of the population in the MENA countries were illiterate; by 1995 literacy rates had doubled. While overall literacy increased more than in any other region, countries with a significant rural population, such as Egypt, Morocco, and Yemen, reported a lower literacy increase than those with high urban populations. Also, countries with high rural populations exhibit the lowest literacy rates among women. Women in rural Morocco and Yemen have the least educational opportunity, with literacy rates of less than 10 percent.

Equity among educational systems is not encouraging, with 5 million children aged six to ten and 4 million children aged eleven to fifteen out of a regular school program, in 1995. By 2015 it is estimated that this number will grow by 40 percent, resulting in projected figures of 7.5 million and 5.6 million, respectively (see also Figure 4). While all countries offer compulsory education, there is limited ability to track student progression, and retention rates from the early 1990s do not indicate a strong success factor. Nearly 30 percent of primary students in Tunisia fail to complete the seven-year cycle, and in Yemen female school retention falls from 31 percent in first grade to only 25 percent in sixth grade.

Although the formal language or language of instruction (especially with regard to religious education) may be Arabic, formal and written Arabic is grammatically different from the vernacular of the spoken dialect. This can constitute a disadvantage especially to those of rural backgrounds with little or no formal exposure to a grammatical understanding of Arabic. Even at the level of the dialect, there are differences that are evident enough to distinguish rural from urban students, differences that can highlight class division rather than encourage educational unity.

In addition to language obstacles, there is also an opportunity compromise mentality that exists, especially within disadvantaged communities. With the lack of child labor laws and a financially struggling economic class, what is the financial incentive for retaining a child in the educational system versus the lost wage opportunity of a working child if there is no foreseeable cost-benefit factor? While this effect may be dominant within rural cultures, it is not uncommon in urban society either because of strong perceptions that the educational systems are misguided and dysfunctional. It is not surprising that there is a generational continuance of poor retention rates in public schools in such countries as Egypt, Morocco, and Yemen.

FIGURE 2

**Quality of teaching.** It is difficult to gauge the quality of education administered throughout the region because only two middle-income countries have participated in objective international assessments: Iran (in the Third International Mathematics and Science Study of 1995) and Jordan (in the International Assessment of Educational Progress of 1991). Other countries, however, have already indicated a willingness to participate in similar future studies. Once it becomes evident that such studies not only provide a baseline of national educational strengths and weaknesses but also suggest methods and directions for systemic improvement, there will be more of an incentive for regional cooperation and participation.

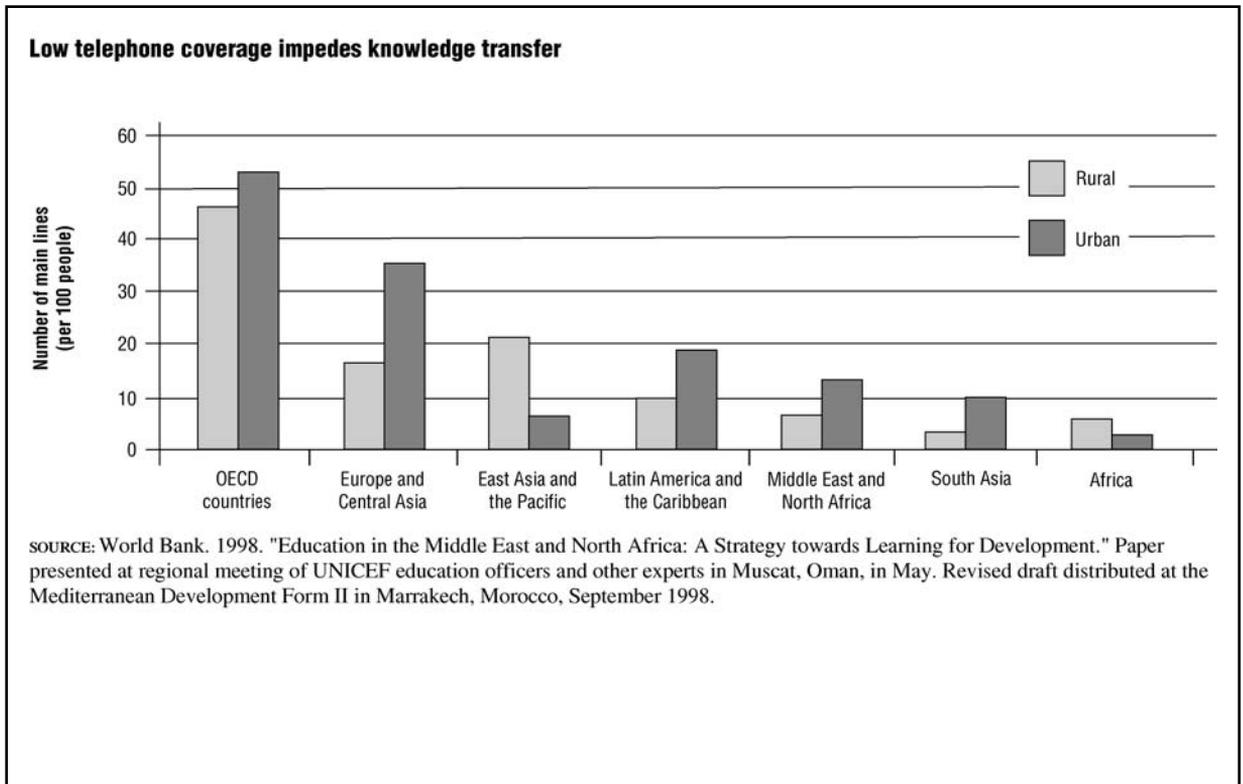

A more complex issue, however, centers around the method of teaching, the relevancy of the material, and the students' ability to manipulate and apply knowledge and data in a manner that will lead to effective problem solving, as well as theory and analysis. Data from 1995 indicate that although the

number of secondary education teachers rose, the percentage of teachers with university degrees fell from 85 percent to 77 percent, and this was accompanied by an average decline in salary expenditure. This reveals a system that is not only reticent about placing an emphasis upon creating a progressive learning environment but that also fails to recognize educational programs as less than a formulation of inputs and outputs. As a consequence of this lack of consistent commitment to faculty and staff, there exists an unbalance in teacher-student ratios.

In addition, there is regional deterioration of the infrastructure of the learning environment. There is not a correlating commitment to libraries, laboratories, and technology workshops for the influx of students, and those facilities that do exist are overburdened and in need of repair.

**Quality of educational materials.** Because the central government continues to play such a dominant role in the management of national education, the quality of educational materials tends to reflect a sys-

FIGURE 3

tem plagued by micromanagement and misapplication. Educational ministries obtain their educational materials through a centrally funded governmental appropriation that is contracted out to either a governmental printing agency or a private agency that relies heavily upon such business. All content, nature, scope, and graphics for educational materials (print and computer-based) are decided from within the hierarchy of the ministry of education, without field study analysis of the needs of the ministry's constituencies. Because this process must be one that stresses cost-effectiveness, texts are a homogenized production that are not able to reflect issues in an authoritatively complete manner, nor are they specifically targeted at different constituent populations. This process, if left unchecked, has the potential to further isolate national student populations from the global market by insulating them from both the technology and the ideas that underpin international commerce. (See Figure 5.)

**Cultural aspects of education.** In their dogmatic mode of planning and their uniform approach to sector problem solving, the central governments of the MENA region are similar to the centrally planned regimes of the former Eastern bloc coun-

tries. In contrast to the nonreligious Eastern bloc regimes, however, the MENA governments have a very strong religious component that permeates the social and political culture. With the rise of state wealth based on oil reserves came the governmental drive to create educational institutions that were governed by Islamic law—new institutions that were in addition to the public establishments. Because of the prominence afforded to Islamic thought, however, all of the educational institutions took on an aspect of Islamic doctrine that was incorporated into religious studies, the study of Arabic, or both. Being forced to respond to many masters is not a unique position in the educational field, especially with the emphasis upon creating the diverse revenue streams of institutional planning and advancement. Nevertheless, because the educational institutions of the countries of MENA are public establishments and rely upon single-source revenues, they must carefully negotiate several powerful relationships within that revenue stream. This results in institutions that are by and large politically, economically, and directionally powerless.

Accompanying the rise of the central government was the creation of the welfare state. Prior to

the oil boom, the work ethic was closely affiliated with local indigenous industries that remained largely unchanged for generations. With the rapid influx of funds, populations began to rely upon the state to provide for their basic needs, including major sectors of education, health, and employment. This has greatly enhanced the general perception of the responsibilities of the state while diminishing the need for social responsibility and achievement. It is not surprising that vocational training is unpopular, as are blue-collar jobs in comparison with white-collar positions. This attitude of a state-reliant labor force and the general popular disinclination toward bottom-to-top corporate ladder climbing puts the educational system into a distinct role: that of educating a workforce that is focused solely upon receiving prominent state-sponsored positions. In this position, the educational system is blamed both for not adequately preparing the workforce to create new jobs and for not adequately training the workers to be able to participate in the economy. Because of this, there is little curricular incentive to emphasize the importance of acquiring and honing the managerial, operational, and technical skills that are basic to the formation of a progressive, evolving, and adapting society.

Under the pressures of central control, religious persuasion, and the micromanaged process that

largely characterizes public education, the system will continue to flounder and be directionless. Such a state of affairs has the potential to further discourage the population from participation if, at some point, the system cannot demonstrate its efficacy in producing national, regional, and international leaders.

### Future Challenges and Direction

Without a doubt, the leadership of the MENA countries will have to develop an acute awareness of the strengths and weaknesses of their educational systems. Based upon this awareness, they will need to design plans and solutions that are both realistic and practical.

**Testing, benchmarking, and information exchange.** If educational systems in MENA are to succeed and effectively integrate with the global community, education must return to its primary goal: “learning should be understanding concepts and principles in order to make inferences from that knowledge and to apply it in daily life” (Heyneman 1990, p. 187). Usage of regional testing of these concepts can and needs to be employed. Creating a “national assessment” that is provided at regular intervals will enable both national progress and overall regional standing to be determined and to be tracked over time. This should not necessarily en-

courage partisanship among countries, because comprehensive regional progress will become a reality with only interregional cooperation. Although initially countries may be hesitant to divulge such previously “sensitive” information, it will become apparent that the introduction to and full participation in the global environment will necessitate such transparency.

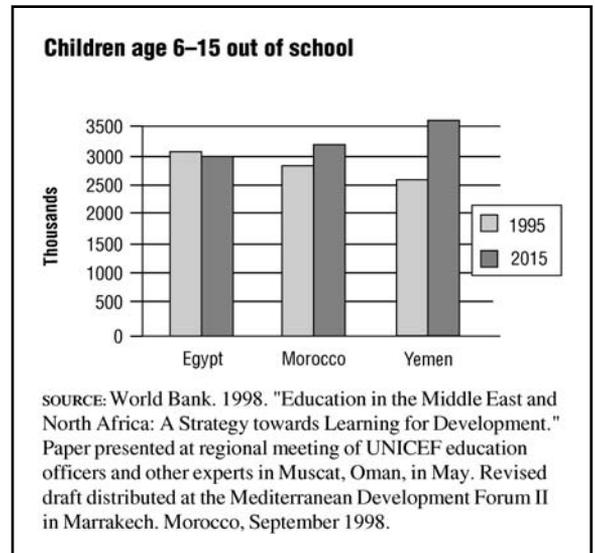

**Financing strategies.** Although the state may remain the organizational and licensing body of education, providers and consumers of education need to understand the ineffectiveness of a state-sponsored educational system. While this does not indicate a total financial withdrawal of the government from the educational arena, it does suggest a reevaluation of the government’s ability to simultaneously finance a growing population and an improvement in the educational services that are provided. It should be determined to what position the state could be expected to recede, but such a transformation should be implemented incrementally over at least one generational period.

Along similar lines, as sectors within the educational ministry are privatized, the state should encourage and initially subsidize private sources of funding. This will result in a competitive environment within the educational industries, encouraging lean costs, higher quality, product accountability, and enhanced consumer choice.

The method of government-controlled educational materials must also be privatized, with the central government operating as “quality control” in the general sense, without overt religious overtones and control. Governments will need to provide subsidy incentives to jump-start this private industry, but as in other countries this will encourage competition and a healthy environment.

**The encouragement of compulsory education.** In encouraging compulsory education, there must be an intention to provide a framework for students that will encourage both the completion of the track and the ability to choose a direction upon completion. This implies a need to abandon the rigid prerequisites during compulsory education that are commonly associated with elite institutions. Teachers will need to be held accountable for their performance in results-oriented evaluations, rather than through strict adherence to a curriculum.

**FIGURE 4**

## Conclusion

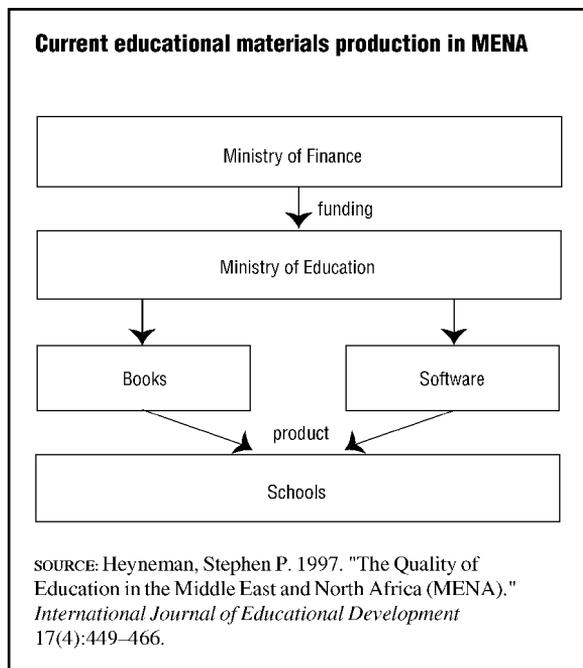

Within the countries of the MENA region, there exist systems of education that are anachronistic in character and dysfunctional with regard to adapting for the world of the future. It is imperative that if MENA is to become an active, tradable partner within the global community, it will need to ready its workforce for the market of today and the market of tomorrow. This implies the need for a self-directed, systematic, and objective look at each country from the method of governance and finance to the manner in which education is presented to the various populations. As painful, costly, and labor intensive as this may be, however, it is only the harbinger of a future in which those countries that are poised to react and adapt will prevail at the expense of countries saddled with unwilling and nonintrospective forms of government.

## MIDDLE SCHOOLS

In 1888 Harvard University president Charles Eliot launched an effort to reorganize primary and secondary schooling. At that time, as state after state enacted compulsory attendance laws, eight-year elementary schools and four-year high schools were the most common types of institutions. But Eliot and his colleagues on the National Education Association's Committee of Ten on Secondary School Studies argued that young adolescents wasted time in the last years of elementary school and should be introduced to college preparatory courses such as algebra and Latin at an earlier age. The committee recommended reducing elementary schools to six grade levels (1–6) and increasing secondary grades to six grade levels (7–12). They also recommended that the new secondary schools be designed to allow talented, college-bound students to be promoted quickly so that they could complete the six years of secondary school in as few as four years.

As grades seven and eight began to be considered *junior* or *introductory* high school grades rather than elementary grades, intermediate schools (grades 7–8), junior high schools (grades 7–9), and junior-senior high schools (grades 7–12) began to appear. These new secondary schools were seen as a way of offering young adolescents a curriculum that was more substantial and more differentiated than that offered in elementary schools, while also addressing common practical problems such as the overcrowding of K–8 elementary schools and high rates of students leaving school after grade eight. In addition to giving college-bound youths earlier access to college preparatory work, educators in these schools sought to entice greater numbers of non-college-bound youths to stay in school at least through grade nine by offering them commercial, domestic, and vocational curricula. By 1920 the number of junior high schools in the United States had grown to 883. By the 1940s more than half of the nation's young adolescents attended a junior high school, and by 1960 four out of five did so.

The enduring contributions of junior high schools to middle-level education in America are

many. These schools introduced a broader range of exploratory, *tryout* courses and activities in order to assist young adolescents to discover and develop their interests and abilities. Junior high schools were also the source of other educational innovations, including homeroom and teacher-adviser programs, extracurricular activities, and core curriculum approaches emphasizing the correlation of subject areas and the integration of learning across disciplinary boundaries.

### The Emergence of Middle Schools

Despite the innovations and successes of junior high schools, these schools became the target of increasing criticism for tending to adopt the curricula, grading systems, large size, schedules, regimentation, and impersonal climate of senior high schools. Ironically, some of the key organizational changes that the early promoters of junior high schools believed would meet the special needs of young adolescents—departmentalization, teacher specialization, and tracking—had been taken to the extreme and were now being challenged as inappropriate for junior high school students. Similarly, many began to have second thoughts about having ninth-grade educational programs in the same school buildings as seventh- and eighth-grade programs. The ninth-grade program and curriculum were constrained by Carnegie unit requirements for high school graduation and college entrance. Because these requirements affected scheduling and staffing decisions, they often strongly influenced the educational programs offered to seventh and eighth graders in junior high schools as well.

Fifty years after the first junior high schools were established, educators began to call for middle schools—new schools that had a different grade organization and a more developmentally responsive program—in order to provide a more gradual and appropriate transition between the elementary and high school years. In the 1950s Alvin Howard became one of the first to advocate the creation of a 6–8 school that would remove the limitations imposed by Carnegie units, have a more stable school climate than a 7–8 school, and would recognize the earlier onset of puberty of young adolescents in the second half of the twentieth century. William Alexander and Emmett Williams, in 1965, recommended the creation of 5–8 middle schools featuring interdisciplinary teaming, small learning communities, a teacher advisory program, and special learning cen-

ters where students could catch up on needed skills or branch out into further exploration. For example, Alexander and Williams suggested the creation of *wing units* (interdisciplinary teams of teachers to jointly plan curriculum and deliver instruction to 100 students). Each wing unit would join with wing units from the other grade levels in the school to form a “school within the school.” The special learning centers would be open during the school day, after school, and on Saturday, and would include a library, a reading laboratory, a home arts center, a typing and writing laboratory, a foreign language laboratory, an arts and hobby center, a music room, and a physical education/recreation center.

In 1966 Donald Eichorn, a school district superintendent, wrote the first full book promoting the creation of 6–8 middle schools. The book attempted to apply Piaget’s theories regarding early adolescent development in designing a suitable educational program. For example, Eichorn proposed that middle schools offer frequent opportunities for active learning and interaction with peers. He suggested eliminating activities that might embarrass late maturers or place them at a competitive disadvantage (e.g., interscholastic athletics and prom queen contests) and replacing them with less competitive activities that welcome and affirm all students regardless of their current level of physical or cognitive development (intramural athletics and physical education programs and flexible self-selected projects that allow all students to pursue personal interests and develop further interests while making frequent use of a well-equipped resource center). He proposed flexible scheduling to allow for extended learning opportunities and flexible groupings of middle school students for instruction (e.g., by current cognitive functioning or interests) rather than just by chronological age or grade level. He called for a curriculum that featured frequent use of interdisciplinary thematic units that reflected the interrelated nature of different content areas and that balanced traditional academic subjects with cultural studies, physical education, fine arts, and practical arts.

By 1970 a small group of educators founded the Midwest Middle School Association, amid much debate and confrontation between advocates of 6–8 middle schools and 7–9 junior high schools. Three years later its name was changed to the National Middle School Association to acknowledge the national scope of the growing middle school movement. The writings of key educators in this

movement displayed increasingly widespread agreement on practices that they believed were especially appropriate for young adolescents, including interdisciplinary team teaching, discovery and inquiry methods, teacher-adviser plans, flexible scheduling, exploratory courses, and ungraded programs.

### **Growth and Maturation of the Middle School Movement**

In 1965 only 5 percent of middle-grades schools in the United States were 6–8 or 5–8 middle schools, and 67 percent were 7–9 junior high schools. By the year 2000 these percentages were reversed: only 5 percent of middle-grades schools were 7–9 junior highs and 69 percent were 6–8 or 5–8 middle schools. The number of middle schools grew rapidly—from 1,434 (23%) in 1971 to 4,094 (33%) in 1981; 6,168 (51%) in 1991; and 9,750 (69%) in 2000.

Although the number of middle schools grew quickly during the 1960s and 1970s, according to William Alexander, writing in 1978, most of these new schools displayed “limited progress toward the objectives of the middle school movement” (p. 19). In fact, John Lounsbury noted in 1991 that the first comparative studies of the new middle schools and the old junior high schools revealed that the schools “were surprisingly alike in actual practice” (p. 68). Changes were restricted largely to the names of schools and the grades they contained.

One reason for the lack of progress in implementing a set of distinct practices was that many middle schools were established for reasons of expediency. For example, the new grade arrangements helped some districts reduce overcrowding in elementary schools, poor utilization of buildings, or racial segregation. Through the 1970s little empirical research was conducted on the consequences of implementing or ignoring the lists of recommended practices. Thus, there was no scientific evidence to persuade educators to change their programs and practices.

By the 1980s the debates between educators about the best grade structures for young adolescents began to die out, as both middle school and junior high school advocates realized that the typical middle-grades school, regardless of grade organization, was still failing to meet the needs of its students. “Junior high and middle school proponents and practitioners began to coalesce into a single cause—the cause of improving early adolescent edu-

cation” (Lounsbury, p. 67). This new unity of purpose and vision was also fueled by the emergence of a strong and respected literature on the characteristics of early adolescents, and by research indicating that the transition to middle-grades schools was associated with declines in academic motivation and performance.

Research also indicated that students perceived their middle-grades teachers as more remote and impersonal than their elementary teachers, and that they were less certain that their middle-grades teachers cared about them or knew them well. Furthermore, student work completed in the first year of the middle grades was often less demanding than in the last year of elementary school, academic expectations in middle-grades schools were generally low, and students had few opportunities to learn important new concepts and apply them to real-world problems. This research along with case studies and empirical analyses of the effects of recommended practices on the quality of school programs and on the learning, motivation, and development of young adolescents all gave further impetus to the calls for the reform of middle-grades schools.

As practitioners, researchers, and scholars began speaking with one voice about the continuing shortcomings of middle-grades education in the United States, middle-grades reform began receiving unprecedented national attention. That is, at the end of the 1980s, states and foundations that had been focusing their educational reform initiatives on preschool and early elementary education or on high school improvement and dropout prevention, began to recognize that the middle grades might be central to helping more students succeed and stay in school. California was one of the first states to produce a task-force report calling for middle-grades reform. California’s 1987 report, *Caught in the Middle*, was followed by a long line of reports from Florida, Maryland, Louisiana, and at least fifteen other states. At about the same time, foundations such as the Lilly Endowment, the Carnegie Corporation of New York, the Edna McConnell Clark Foundation, and the W. K. Kellogg Foundation began advocating and funding middle-grades reform initiatives.

These efforts helped solidify the consensus on the kinds of supportive structures and responsive practices needed by students in the middle grades (e.g., the eight principles outlined in 1989 by the Carnegie Council on Adolescent Development in *Turning Points*). At this time, research in the middle

grades by a wide variety of researchers began to show that schools serving early adolescents, especially middle schools, were increasingly implementing educational programs that were based on these recommended practices for the middle grades. Fewer schools were middle schools only in name.

### Accomplishments of the Middle School Movement

Anthony Jackson and Gayle Davis noted in 2000 that “structural changes in middle-grades education—how students and teachers are organized for learning—have been fairly widespread and have produced good results” (p. 5). Changes in practice that ensure each student in a middle-grades school has more support from (and more meaningful relationships with) caring adults at the school have reduced the negative shifts in students’ motivational beliefs during the middle grades. Schools-within-schools, looping (assigning teachers to the same students for two or three years), semidepartmentalization (assigning a teacher to teach two subjects to three class sections rather than one subject to six class sections), and interdisciplinary teaming with a common planning period for the teachers on a team are examples of structural reforms that have been made in many middle-grades schools. Such reforms have been found to increase students’ well-being and perceptions that their teacher cares about them and their learning, and to strengthen teacher–student relationships. In turn, when middle-grades students perceive their teachers care about them and their learning, they are more likely to report that they try to do what their teachers ask them to do and give their best effort in class, and they are less likely to engage in risky behaviors.

In sum, many middle-grades schools have succeeded in changing their climates and structures to become what Joan Lipsitz and colleagues, in 1997, called “warmer, happier, and more peaceful places for students and adults” (p. 535). However, as David Hamburg noted in 2000, changes in climates and structures “are necessary but not sufficient for major improvement in academic achievement” (p. xii). That is, while modest achievement gains may result from changes in school organization—such as semidepartmentalization, team teaching, or creating smaller learning environments—major achievement gains are obtained only in schools that have implemented both changes in school organization and in curriculum, instruction, and professional develop-

ment changes that assist teachers to “transmit a core of common, substantial knowledge to all students in ways that foster curiosity, problem solving, and critical thinking” (Hamburg, p. x). For example, in a 1997 study by Robert Felner and colleagues of a group of thirty-one Illinois middle schools, those schools that had made both structural and instructional changes that were consistent with *Turning Points* recommendations achieved substantially better and displayed larger achievement gains over a two-year period than did similar schools that had implemented at least some of the key structural changes outlined in *Turning Points*, but not changes in curriculum and instruction. Another study suggesting the critical importance of going beyond just structural changes in improving achievement was conducted by Steven Mertens, Nancy Flowers, and Peter Mulhall in 1998, and involved 155 middle-grades schools in Michigan. When these researchers analyzed outcomes in schools that had one of the key structural changes in place (interdisciplinary teams that were given high levels of common planning time), they found that achievement gains were much higher among the subset of these schools that had received a grant from the Kellogg Foundation that made it possible for their teachers to engage more regularly in staff development activities focused on curriculum and instruction. In fact there is even evidence from this study that staff development may be more important than common planning time in facilitating achievement gains. Schools whose teams had inadequate common planning (but had a grant that made frequent professional development possible) showed more achievement gains than did schools without grants, even those whose teams had high levels of planning time.

Unfortunately, high-performing middle schools are still rare, because “relatively little has changed at the core of most students’ school experience: curriculum, assessment, and instruction” (Jackson and Davis, p. 5). Although structures and practices that are in keeping with the best of the middle-grades reform documents are an essential foundation for middle-grade reform, dramatic and sustained improvements in student performance occur only if teachers also provide all students with markedly better learning opportunities every day.

### Enduring Problems

One particularly vexing problem that plagued junior high schools and continues to plague middle schools

is what Samuel H. Popper termed being “a school without teachers” (p. 57). Because of the lack of teacher education programs and licensure that focus on the middle school level, the majority of young adolescents are taught by teachers who prepared for a career as an elementary or high school teacher. Fewer than one in four middle-grades teachers have received specialized training to teach at the middle level before they begin their careers. As a result, teachers who wind up teaching in middle schools, even those who discover that they enjoy teaching middle school students, find themselves woefully unprepared to work with this age group. Thomas Dickinson commented in 2001 that these instructors enter middle schools “unschooled in appropriate curriculum and instruction for young adolescents, and ignorant of the place and purpose of middle school organizational practices and the complex role of the middle school teacher” (p. 7). This is clearly one reason why curriculum and instruction in the middle grades continues to show little improvement over time.

There is a growing consensus to support specialized teacher preparation at the middle-grades level. Numerous studies show that middle-grades teachers and principals favor specialized teacher preparation of middle-grades teachers. Similarly, the National Middle School Association, The National Association for Secondary School Principals, and the National Forum to Accelerate Middle Grades Reform have all called for the specialized preparation of middle-grades teachers. Perhaps the only solution to this enduring problem is for states to establish mandatory requirements for middle-level licensure that do not overlap significantly with licensure for elementary school or high school teachers. This will serve as an incentive for colleges and universities to establish specialized programs that prepare practicing and future teachers to work effectively with middle school students, curricula, and instructional practices, and also as an incentive to teachers to pursue this specialized training.

Unfortunately, there is also a lack of middle-school principal preparation. “Preparation to lead a school based on the tenets of the middle school concept is even more rare than middle school teacher preparation programs. The same can be said for the licensure of middle school principals” (Dickinson, p. 7).

The National Forum to Accelerate Middle Grades Reform declared in 2000 that high-

performing middle schools are “academically excellent, developmentally responsive, and socially equitable” (p. K7). If such middle schools are going to become the norm rather than the exception, both middle school teachers and principals need more specialized preparation and continuing professional development to support and sustain their trajectory toward excellence.

### MIEL, ALICE (1906–1998)

A nationally prominent social educator, Alice Miel was also a curriculum development scholar and practitioner.

## Career

Miel, born on a small farm in rural Michigan, eventually studied to become a teacher during the height of the Progressive movement in education, which emerges as the strong undercurrent in Miel's life. Her formative years as an educator were spent at the University of Michigan and at Tappan Junior High School in Ann Arbor, Michigan, where she taught social studies and Latin in the early 1930s. There her benefited from an educational environment in which local school faculty and students could practice democratic skills of deliberation and decision-making. In particular, Miel's participation in collaborative curriculum development projects reflected her growing concern about the effects of the Great Depression on society and the schools. Incorporating the ideas of John Dewey, as well as those of leading progressive educators such as Harold Rugg, Ann Shumaker, and William Heard Kilpatrick, Miel and her colleagues demonstrated their conviction that the school curriculum must be modified to emphasize the study of contemporary social problems. Another early landmark experience for Miel was a 1936 study session at Ohio State University with Laura Zirbes, a prominent figure in the field of elementary education. Miel left this meeting with a commitment to understanding children, not just content, and to providing for their individual differences.

The "child-centered" Progressive education movement of the late 1930s had become the conventional wisdom in American educational thought and practice, and Miel moved into this company in the early years of her career in education, even as the Progressive movement began to fracture because of both internal divisions and external attacks. At this time of transition, the locus of Miel's story began to shift to Teachers College, Columbia University, where it would remain for the next three decades. Miel became the doctoral student of Hollis L. Caswell, then chair of the newly organized Department of Curriculum and Teaching at Teachers College. Caswell had already enhanced the visibility of the curriculum field, developed the idea of method in curriculum making, focused attention on the process by which a variety of people interacted in order to make curriculum, tried to reduce the gap between theory and practice by defining curriculum as actual experiences undergone by learners under the direction of the school, and provided a curriculum design that helped teachers to apply concepts from organized knowledge to the solution of social problems.

Caswell helped Miel to formulate the problem of curriculum change as a social process for her dissertation, which was later published as *Changing the Curriculum: A Social Process* (1946). Miel went on to serve as a professor at Teachers College from 1944 through 1971; she chaired the Department of Curriculum and Teaching at Teachers College from 1960 through 1967.

Miel became more deeply involved in Progressive ideas, even as the movement itself began to wane. Her career at Teachers College spanned the later years of the college's preeminence as the intellectual crossroads of the Progressive education movement. Her tenure there also spanned the movement's alleged decline and disarray in the 1950s as the main target of conservatives who attacked Progressive philosophy and demanded a return to the "basics" of schooling. In the 1960s, Miel's last decade at Teachers College, the national mood shifted again as Charles Silberman and other humanist educators decried conformity and rigidity in school curricula and wanted to return the focus of education to the needs of individual learners.

Miel made substantial efforts to promote democratic leadership and decision-making among educators and to enhance the capacity of schools for change and self-renewal. Her ideas and activities in this regard are instructive for current policymakers. Miel developed a knowledge base of factors that affect schools' capacity for change, established collaborative relationships with educational institutions and associations that shared the value underlying this goal, used cooperative action research to help school systems plan and implement research-based instructional innovations, worked to influence and involve a variety of community members in decisions affecting their schools, and developed exemplary models of school change in her curriculum development research.

## Contribution

Several significant themes emerge from Miel's body of work. First, Miel advocated the development of democratic behavior as the ultimate goal of schooling. More importantly, she was one of the first curriculum scholars to apply social learning theories and democratic principles and processes to various aspects of curriculum development and school administration. She emphasized that curricular change is a complex social process that involves an array of participants in individual schools and communities.

Also, she strongly advocated that educators develop curriculum at the school level because of her belief that the teacher was the most important factor in curriculum change and that reform efforts would fail if they did not include the people who would have to carry them out. Through these ideas, Miel addressed the gap that long existed between educational theory and practice, implying that the involvement of various participants in the curriculum development process creates a relationship between theory and practice and allows that relationship to flourish.

Furthermore, Miel focused on the democratic social learning environment of children in schools. Miel believed that the school was democracy's proving ground because it had a large share of the responsibility for socializing the nation's young people into participation in democracy. Although some critics may have questioned whether democratic lessons could be gained from an institution that mandated participation, Miel viewed the school as society in microcosm, where people from many backgrounds learned about freedom and responsibility, individuality and cooperation—all with an eye toward citizenship. Furthermore, throughout her own life, Miel continued to develop a keen sense of the historical context of social problems that, for her, raised acute concerns for the future of a democratic society: postwar reconstruction, the cold war and Red Scare, the social tensions between “haves” and “have nots,” and the Watergate scandal. In particular, she was deeply affected by the state of race relations and civil rights in American society. Through these experiences, Miel sought to move beyond the outmoded notion of racial tolerance, which, for her, connoted “putting up” with people who were different, to a more active, broader notion of intercultural understanding and appreciation. In this area, one of Miel's research accomplishments during her tenure at Teachers College merits particular attention: her 1967 book with Edwin Kiester, *The Shortchanged Children of Suburbia*, an award-winning study that has been characterized as a “groundbreaker” in its emphasis on what suburban schools were failing to teach about human differences and cultural diversity. Miel also sought to refute the claims of back-to-basics school reformers of the 1970s, arguing that the “basics” also extended to the “moral-ethical-social realm,” and that they should be given a prominent place in the school curriculum. She returned to these themes in 1986 in the

context of the “educational excellence” movement, manifested in reports such as *A Nation at Risk: The Imperative for Educational Reform* (1983). For Miel, the overarching responsibility in democracy was to know how democracy worked and how to maintain it through changing conditions.

Several factors likely limited the widespread acceptance of Miel's conceptions of social learning and social studies. First, Miel believed that social learning should be taught throughout the school day and not compartmentalized into one particular academic subject area. This view may have posed problems for teachers and curriculum workers, who increasingly tended to think in terms of discrete subject areas. Second, the circulation of Miel's ideas was restricted by the publication of her book *More Than Social Studies* (1957) during the conservative, subject-centered reform movements of the late 1950s. The book's publication unfortunately coincided with increasing public criticism of the perceived academic “softness” of American schools and growing demands that mathematics and science receive priority in education. The *Sputnik*-inspired National Defense Education Act (1958), linking federal support for schools with national policy objectives, ensured that social studies would be deemphasized and that traditional academic history likely would prevail in new federal guidelines for education. Third, Miel lacked affiliation with social studies traditionalists and was not considered an “expert” or specialist in any of the social sciences. Nor did Miel become deeply involved in the “new social studies” movements of the 1960s, particularly because they often resulted in written courses of study that she eschewed—for example, *Man: A Course of Study* (MACOS), which she criticized because of its lack of emphasis on modern man and his problems.

Finally, in terms of other accomplishments, Miel was one of the early presidents of the Association for Supervision and Curriculum Development (1953–1954). In the 1970s, she became a guiding influence in the founding of the World Council on Curriculum and Instruction (WCCI). The establishment of the WCCI was a natural outgrowth of her interest in improved curricula for all children and her work with doctoral students from all over the world. One of the distinguishing features of her career was her advocacy of global understanding through cooperation in international educational activities. Through these activities, and through her

supervision of more than 140 doctoral dissertations, Miel's influence was indeed widespread.

## MIGRANTS, EDUCATION OF

Anyone who has marveled at the amazing variety of fresh produce and canned and frozen foods in most U.S. supermarkets can thank a migrant farm worker for this bounty. In spite of increased mechanization of agricultural work, seasonal labor continues to be

required for the cultivation and harvest of fruits and vegetables. The dairy and fishing industries are also reliant on seasonal migrant labor.

Unfortunately the children of migrant agricultural workers are among the most educationally disadvantaged children in the United States. The conditions associated with their migratory lifestyle, such as discontinuity in education, social and cultural isolation, strenuous work outside of school, extreme poverty, and poor health, impose multiple obstacles to educational success. Limited proficiency in English may be an additional educational burden. Schools coping with temporary seasonal increases in enrollment can face significant challenges in addressing the migrant students' unique educational needs. Many schools serving migrant students are small schools located in rural areas, often with limited staff and resources.

Migrant students reside in all states, the District of Columbia, and Puerto Rico. It is difficult to know the exact number of migrant children in a state at a given point in time, since migrant farmworkers and their families often move across state and national boundaries. In 2000 the U.S. Department of Education counted approximately 800,000 migrant children in U.S. schools. Close to half of these children attend schools in California and Texas; and ten other states—Arizona, Colorado, Florida, Kentucky, Michigan, North Carolina, Oregon, Pennsylvania, Puerto Rico, and Washington—account for nearly one-third of migrant students.

### Migrant Families

The life of migrating families is in many ways distinct from mainstream America. Each year migrant families travel to remote parts of the country seeking employment in highly uncertain labor markets to work under strenuous and often hazardous conditions. Most migrant workers were born outside the United States, and many have difficulty speaking English. Due to the extreme economic conditions of migrant life, children often must take on work and family responsibilities at a young age, sometimes to the detriment of school attendance. In addition working in the fields exposes migrant students to a variety of health risks, such as accidental injury or exposure to pesticides.

About two-thirds of migrant students come from families where earnings are below the poverty level. The cost of migrating is high, and it is common

for migrants to arrive at a new destination with little or no money or food. Living conditions are cramped and substandard—camp housing units often consist of one small room for each family that serves for cooking, eating, and sleeping. Many migrant students suffer educational disadvantages stemming from poverty and poverty-related health problems that can directly affect school performance, such as malnutrition, parasitic infections, and chronic illness.

The typical migrant adult has received less than seven years of formal schooling. Most were schooled in their home country, and are unfamiliar with the American educational system. As in many homes where the adult literacy level is low, children are less likely to be exposed to books, magazines, and other print media that promote early literacy and school readiness. Nonetheless, migrant parents, like all parents, see education as a path to a better life and place a high value on their children's education.

While migrant families may consider school quality, among other factors, when moving, decisions about where and when to relocate are ultimately based on economic necessity. Migrants must weigh such factors as the length of seasons, changes in crop conditions, demand for labor, wages, and housing availability. Migrants tend to follow the crops from south to north in the spring and then back south in the fall. Since the pattern of enrollment for migrant children is generally one of late entry in the fall and early withdrawal in the spring, migrant students are often unable to complete a school term.

In terms of ethnicity, the population of agricultural workers is overwhelmingly of Hispanic origin. More than three-quarters of workers are Mexican-born. Not surprisingly, the great majority (84%) of migrant workers are native Spanish speakers; only 12 percent are native English speakers. About 80 percent of migrant children are likely to live in a home where no English is spoken, so many arrive in schools unable to comprehend the language of instruction.

### **School Programs for Migrant Students**

While the specific services available to migrant students in schools can vary widely, all programs address the identification and recruitment of migrant students, their assessment and placement, and the coordination of services.

School services for migrant students start with their identification or recruitment. *Identification* is the process by which children already enrolled in school are identified by staff as migratory, and therefore eligible for supplementary services. *Recruitment* refers to the process of bringing nonenrolled school-age migrant children into the school system. Migrant specialists hired by the school district or state usually perform student recruitment. Recruiters also act as ambassadors, welcoming students into the school system and serving as a conduit of information between migrant parents and schools.

Once a migrant student is enrolled, the school must determine if the regular school program will be sufficient, or if additional services are required. In many cases formal assessments must be administered to determine language proficiency, grade-level placement, and the need for special education services. School staff, or a migrant liaison, will communicate with the family about the child's educational and health history. If the students' prior school and medical records are available, this greatly expedites the placement process and avoids needless educational delays and interruptions. For secondary students, the consequences of delayed placement can be particularly high, as they may fail to accrue the credits needed for graduation.

In states and districts with a predictably high migrant population, schools may offer well-coordinated programs and services that target their specific needs. In other areas, service coordination and academic programs may be deficient or lacking entirely. Students migrating during the academic year might experience both environments. Quality programs for migrant students generally include a number of features to help them overcome educational disruption, cultural and language barriers, social isolation, and health-related problems. These features include:

- Enhanced reading and math instruction.
- English as a Second Language (ESL) and/or bilingual instruction.
- Tutoring.
- Classroom aides.
- Summer programs.
- Guidance and counseling.
- Parent outreach.
- Social work.
- Clothing.

- Nutrition.
- Transportation.
- Dental and medical services.
- Accommodations for enrollment, credit accrual, and transfer.

Transitional centers, sometimes called Newcomer Centers, may exist in districts with high numbers of immigrant and migrant students. Aimed at secondary students, these centers undertake a comprehensive assessment of incoming student needs and offer specialized classes designed to facilitate transition to regular classrooms. Most newcomer programs are set apart from the regular schools and focus on providing intensive English language instruction and developing basic literacy for students with limited formal schooling. The centers also help students develop study skills, and they familiarize new students and their families with the schools' expectations and protocols.

Another type of comprehensive program is known as a *schoolwide*, or *whole-school*, program. Rather than separate students out for specialized instruction, schools with schoolwide programs have reformed their entire regular educational program and incorporated a variety of health and other services to improve achievement for all students. Approximately 20 percent of migrant students are served in schoolwide programs.

When the small numbers of migrants or limited resources may prevent the implementation of a comprehensive program, many schools concentrate available resources on a few of the program features listed above. Programs may focus on supplementary and remedial instruction, generally in reading, math, or ESL, through specialized classes either during the school day or after school. Other schools may rely on bilingual aides to help students keep up in the regular classroom, or on migrant advocates/liaisons to help migrant families understand and access the services available to them. In several states most or all of the special educational services for migrant students are provided through summer educational programs.

### **In the Classroom**

Services for migrants may be provided by specialized personnel such as bilingual instructors, remedial instructors, counselors, or summer school teachers, but regular classroom teachers play a critical role in helping migrant students thrive. The literature on

migrant education repeatedly emphasizes the importance of: (1) building on the strengths and experiences migrant students bring to the classroom, (2) establishing a positive learning environment where the diversity among students is acknowledged and celebrated, and (3) allowing students to demonstrate their knowledge in a variety of ways.

It is important for teachers and aides to have an open communication with migrant students about their prior educational and life experiences so they can build on what the student already knows. For example, students who have worked in the fields will have knowledge of nature and agriculture, which can be a starting point for learning in science. If the student has been learning in his or her home language, a teacher can capitalize on that skill; either by using the native language or by locating supplementary native language materials to reinforce material presented in English.

Easing the transition of migrant students to a new school is crucial, especially when the student is a late starter. A student who feels disoriented or unwelcome will have difficulty learning. Teachers can reduce anxieties and avoid difficulties by clearly explaining the everyday routines and policies within the school. Students new to U.S. schools may be completely unfamiliar with elements of school that seem commonplace to most American school kids, such as hall passes, school bells, changing classes, gym, cafeterias and lunch lines, lockers, holidays, and disciplinary methods. Using cooperative groups or assigning classroom "buddies" for new students can help the students to adapt and begin to feel more at home. Teachers of migrant students need to be attentive to warning signs. When new students are withdrawn, aggressive, or over-talkative, these may be indicative of adjustment problems rather than general behavior problems.

Teachers may also take advantage of professional development opportunities to enhance classroom techniques for working with diverse learners. Effective schooling research suggests strategies to promote excellence for *all* students. These include maintaining high expectations, personalized contact and smaller classroom size, and providing opportunities for students to demonstrate initiative, competence, and responsibility.

### **National and State Programs**

Most programs for migrant students receive funding through the U.S. Department of Education's Mi-

grant Education Program (MEP). Federal MEP funds are allocated to states based on the number of migrant students and the state's average per-pupil expenditure. Since its inception in 1966, the MEP has supported school-based supplementary educational programs, tutoring services, school- and community-based health services, parent involvement and family literacy programs, summer enrichment programs, and professional development for teachers. The MEP also maintains a toll-free nationwide Migrant Education Hotline that families can use to reach the nearest migrant program.

Funding from several smaller federal grant programs also reaches many migrant students. Migrant Head Start (MHS) provides comprehensive preschool and daycare programs. The Migrant Education Even Start (MEES) program helps migrant families break the cycles of poverty and illiteracy through programs for early childhood education, adult basic education, and parent education. The High School Equivalency Program (HEP) provides grants to colleges, universities, and community organizations to help migrants obtain a General Educational Development Diploma (GED) and prepare them for college or the workplace. College Assistance Migrant Program (CAMP) grants help colleges and universities provide financial and academic assistance to migrant students in their first year.

In the absence of a national system to transfer migrant student records between schools, states have developed intrastate and regional interstate databases to track and transfer student records, and also to share curriculum materials. By facilitating timely identification and appropriate placement of students, these information-sharing consortia play a critical role in reducing the educational disruption experienced by migrant youth. Many states share student information, as well as teachers and textbooks, with schools in Mexico through the Binational Migrant Education Program. Multistate programs, such as the Portable Assisted Study Sequence (PASS), which is used in thirty-one states, help secondary migrant students meet graduation requirements by allowing students to complete their coursework semi-independently through correspondence study. Newer state and regional programs have adapted the PASS model to enable mobile students to complete coursework through the Internet.

## Issues and Trends

Many millions of migrant children have benefited from the work of federal agencies, states, and schools to expand educational opportunities and open the way for a better future. Still, very little is known about how well these programs and services are working. Due to the high mobility of the population, different record-keeping among the states, and the absence of a national tracking system, program administrators have limited means of determining the impact of a program or a schedule of services on a particular migrant child. Establishing a workable, efficient, secure, nationwide system of tracking migrant student records and progress remains the central challenge for the migrant education community. A centralized information system would help minimize disruptions caused by placement delays, and would also permit meaningful assessment of educational outcomes. The No Child Left Behind Act, signed into law in January 2002, calls for an expanded federal role in the development of a national system of records transfer.

Since the early 1990s, education reform has tended to focus on the setting of high education standards and the development of standards-based curricula and assessments. As more and more states are requiring that all students be included in statewide assessments, it is likely that more data on migrant student achievement will become available. Students migrating within a state may benefit from having consistent curricula and clearly defined goals and improved documentation of their progress.

While instruction by video and correspondence remain widely used distance-education tools in migrant programs, the benefits of Internet technology are also beginning to reach migrant students. Some programs allow students to complete coursework online and take advantage of Internet-based distance learning. Migrant educators are creating innovative ways of using new technologies to enhance the continuity of learning; for example, the Estrella program, based in Texas, provides students with laptop computers and modems to help them keep up with course work while away from their home district.

Helping migrant students overcome multiple barriers to success poses a tremendous challenge to teachers, migrant advocates, schools, and families. The mission for all members of the migrant education community is to ensure that students' cumulative educational experiences—in spite of obstacles, moves, and changes—lead them toward success.

### U.S. AIR FORCE ACADEMY

The mission of the U.S. Air Force Academy, the nation's newest federal service academy, is to "inspire and develop outstanding young men and women to become Air Force officers with knowledge, character, and discipline; motivated to lead the world's greatest aerospace force in service to the nation." The academy is located just north of the city of Colorado Springs, Colorado. Its 18,000 acres border the eastern slopes of the Colorado Rocky Mountains. Since its establishment in 1954, the academy has graduated more than 34,000 cadets to serve in all of the U.S. military services. It is accredited by the North Central Association of Colleges and Schools, Commission on Institutions of Higher Education, and the chemistry, computer science, engineering, and management programs are accredited by their respective accrediting organizations.

The first class of 207 graduated in June 1959, while the first class to include women graduated in June 1980. Since then, the academy has had more than 2,600 women graduates. Congressional legislation limits enrollment to a maximum of 4,000 students as of the early twenty-first century. Cadets are appointed from all fifty states and from the U.S. territories, and must be between seventeen and twenty-two years of age on July 1 of the year of admission. Each must be a U.S. citizen, unmarried, and have no dependent children. They must be qualified academically, physically, and medically, and be nominated by a legal source as authorized in Title 10 of the U.S. Code. Those sources include a candidate's U.S. Representatives, U.S. Senators, the President of the United States, the Vice President of the United States, and several military-related sources for eligible individuals. To graduate, cadets must complete the entire four-year program.

The faculty comprises 560 full-time military and civilian members. Approximately 55 percent possess doctoral degrees. Fifteen percent of the faculty are women. Career Air Force officers provide most of the instruction, complemented by officers from the other services, officers from several allied nations, permanent civilian faculty, visiting professors from civilian institutions, and representatives from several federal governmental agencies. Many of the military faculty and some of the civilian faculty are academy graduates.

### Legal Status

Since its inception, the academy's overall mission, goals, and objectives have not appreciably changed. That singularity of purpose—to graduate second lieutenants who are motivated and prepared for military careers in service to their country—has been a unifying force across the institution's history and structure. Various sections under Title 10 of the U.S. Code establish the basic guidelines for the functioning of the academy to include the instruction and preparation of the cadets for military service, the four-year course of study, and civilian oversight through its Board of Visitors.

### Governance

The superintendent reports directly to the chief of staff of the U.S. Air Force. Through the chief of staff, the academy also responds to the secretary of the Air Force. The superintendent has the clear responsibility and authority to make decisions affecting the re-

sources and functional integrity of the academy. The principal internal governing body is the academy board. The superintendent, through the board, exercises institutional decision-making authority. Board members are both experienced educators and senior officers in positions to institute changes in policies or practices across the academy.

Each fall, a conference, attended by the most senior Air Force general officers and the secretary of the Air Force, is held at the academy. This conference presents a unique opportunity to formally present and advocate specific programs to Air Force leaders. It also gives these leaders an opportunity to provide guidance or recommendations to the academy on its programs or practices.

Although not a formal governing body, the presidentially and congressionally appointed Board of Visitors is the academy's primary external review group. This board, which reports directly to the president of the United States, is chartered to review policies and protect the integrity of the institution, including its resources. The inclusion of two professional educators on this board, which also contains academy graduates, ensures a well-informed basis for institutional oversight and advocacy.

### Academics

The academy offers a four-year undergraduate curriculum of academic, leadership, and military training; physical education; athletics; and aviation courses. The total academic curriculum provides cadets with a solid foundation appropriate to an Air Force career and the activities of a responsible American citizen. A core curriculum provides the common body of knowledge that prepares all cadets for the Air Force profession. The academic core consists of courses in basic sciences, engineering, humanities, and social sciences. Other core requirements include military strategic studies and physical education courses.

The academy offers thirty academic majors: aeronautical engineering, astronautical engineering, basic sciences, behavioral sciences, biology, chemistry, civil engineering, computer engineering, computer science, economics, electrical engineering, English, engineering mechanics, environmental engineering, foreign area studies, general engineering, geography, history, humanities, legal studies, management, mathematical sciences, mechanical engineering, meteorology, military strategic studies,

operations research, physics, political science, space operations, and social sciences. Minors in foreign language and philosophy are also offered. All cadets must have a major and may choose their courses from the more than 500 offered each year.

The Air Force Academy ranked second in the United States in the 2001 *U.S. News and World Report* ranking of top aeronautics and astronautics programs, behind Embry Riddle Aeronautical University. It tied for sixth place in the 2001 *U.S. News and World Report* ranking of best undergraduate engineering programs in schools without Ph.D. programs, and it was ranked the fourth-best overall academic experience for undergraduates by *Princeton Review's* 2001 "Best 331 Ranking," placing just behind Princeton, Amherst, and Harvard. The academy was also named a Truman Scholarship Honor Institution for 2001. Only four or five colleges and universities are selected for this honor each year, and only thirty have been selected in the history of the award, which is based upon academics, leadership qualities, public service, and positive influence upon the changing face of higher education.

Other honors include being named one of sixteen Leadership Institutions by the American Association of Colleges and Universities' Greater Expectations Initiative Consortium on Quality Education, and the receipt of a Pioneer Award at the Fourth Annual Conference on Ubiquitous Computing, sponsored by Educause. The Pioneer Award was presented to seven higher education institutions that made early commitments toward offering students access to technology.

### **Cadet Development**

The academy program of cadet development rests on four conceptual pillars: professional military training, academics, athletics, and character development. The military training program develops the techniques and attributes of successful leadership. The goal of this multidimensional program is to develop the knowledge, skills, values, and behavior patterns required to be an effective Air Force officer. The academic program is designed to provide cadets with a broad, high-quality education at the undergraduate level. Since the academy's origin, it has sought to produce graduates with the breadth and ability to represent the Air Force in academic settings and with the general public.

The objective of the physical development program is to develop good physical conditioning, as

well as to foster traits of teamwork, courage, aggressiveness, self-confidence, and an intense desire to win—all of which are essential to a military officer. While at the academy, every cadet takes at least six semester hours of physical education courses. In addition, cadets must participate in intramural or intercollegiate sports throughout the academic year.

While good character is important in most professions, it is vital to the military officer. Character includes ethical behavior, respect for human dignity, and a sense of honor that transcends self-interest. The character development program fosters development of these characteristics and ensures they also are reflected in the other pillars. This program focuses on the academy's core values of "Integrity First, Service Before Self, and Excellence in All We Do." The balanced emphasis on the four pillars of cadet development sets the academy apart from most of the approximately 3,800 institutions of higher education in the United States.

Upon graduation, a cadet receives a bachelor of science degree and a reserve commission as an active-duty second lieutenant. Graduates are required to serve at least five years in the Air Force or, for a very few graduates, in one of the other armed services. The excellent education graduates receive is reflected in the number of prestigious postgraduate scholarships and fellowships they have been awarded. Cadets have won more than 1,900 of these prestigious awards (as of 2001), including thirty-two Rhodes scholarships, nine Truman scholarships, and five Marshall scholarships.

To further motivate academic excellence, the academy has a graduate program that annually allows approximately twenty selected cadets to attend advanced degree programs immediately after graduation at schools around the country. This program prepares them for a possible future assignment as a faculty member. Additionally, the National Competitive Scholarship Program allows approximately twenty cadets to attend prestigious international and national graduate schools for advanced educational opportunities, and up to 3 percent of each graduating class are allowed to attend medical school, .5 percent are allowed to attend dental school, and .5 percent are allowed to attend nursing school.

JOHN SHERFESEE

## U.S. COAST GUARD ACADEMY

The Coast Guard's ability to effectively serve as a viable maritime, military, multimission organization hinges on its leaders' ability to think, learn, and act effectively and ethically. Thus, the Coast Guard Academy (CGA), as an institution of higher learning and the primary source of the Coast Guard's leaders, is critical in enabling the Coast Guard to perform its duties and fulfill its mission.

The mantra of developing leaders of character is firmly embedded in CGA's institutional mission: "The Coast Guard Academy is committed to strengthening the nation's future by educating, training, and developing leaders of character who are ethically, intellectually, professionally, and physically prepared to serve their country."

### History

The U.S. Coast Guard fulfills unique roles in support of the nation's military and economic security. These roles go directly back to visionary, nation-building initiatives of Alexander Hamilton, George Washington, and the first Congress. In 1790 Alexander Hamilton, the nation's first treasury secretary, developed fiscal plans and economic policies for the United States. Central to his vision for a self-sufficient and strong nation was the creation of the Revenue Cutter Service. In 1915 the Life-Saving Service and the Revenue Cutter Service were combined to create the present-day U.S. Coast Guard, which is now an agency in the Department of Transportation.

Congress chartered the Coast Guard Academy in 1876. At first it was simply a school ship—the academy's first home was the Revenue Cutter *Dobbin*. Nine cadets were selected by competitive examinations, and appointments of CGA cadets today continue on a merit basis. The early cadets learned at sea under a single professor, studying a blend of liberal arts and professional subjects. In the early

1900s the curriculum grew to three years, gaining emphasis on engineering and science. In 1910 the Academy came ashore to makeshift facilities at Fort Trumbull in New London, Connecticut, and in 1932 moved to its modern, purpose-built campus, also in New London. In 1939 the academy's general engineering program was accredited by the Engineer's Council for Professional Development (ECPD). In 1940, after also being accredited by the Association of American Universities, it was given the authority to grant the bachelor of science degree. In 1946 the USCG Barque *Eagle*, a prize of war, was commissioned into the U.S. Coast Guard and stationed at the academy for sail training.

The academy became accredited by the New England Association of Schools and Colleges (NEASC) in 1952. In 1973 electrical, marine, and ocean engineering programs were accredited by ECPD, and in 1978 the civil engineering major was accredited as well. In 1980 ECPD was renamed ABET (Accreditation Board for Engineering and Technology), and in 1996 the academy was fully accredited in mechanical engineering. The management major was admitted into candidacy in 1998 by AACSB International—The Association to Advance Collegiate Schools of Business. The CGA also offers majors in government, marine and environmental sciences, and operations research and computer analysis.

Over the years, the Coast Guard Academy matured into a learning environment that (1) fosters a high sense of honor, loyalty, and dedication to service and humanity; (2) provides a sound undergraduate education in fields of interest to the Coast Guard; and (3) trains future officers in professional and military skills required for career service. Cocurricular activities in professional development and athletics add to the ability of CGA to fulfill its mission. Commissioned graduates from the undergraduate program have served with distinction in peace and war and they make up the majority of the officer corps of the modern Coast Guard.

Other noteworthy milestones include the admission of women cadets into the Academy in 1976, with the first women graduates in 1980. In 1998 the Academy established the Leadership Development Center (LDC), a center for leadership education, training, and development that focuses on the career needs for a diverse population of Coast Guard adult learners (military and civilian members associated with the Coast Guard and a limited number of international students from other maritime countries).

## Organizational Structure

Since 1994 governance of the academy has been provided by a board of trustees, comprising Coast Guard senior managers and other distinguished individuals with strong ties to education. Their general purpose is to oversee all programs at the academy and provide guidance and advice to the superintendent of the academy, the Coast Guard chief of staff, and the commandant of the Coast Guard. It was this newly chartered board that endorsed the LDC and supported a substantive mission change, which was accepted by the NEASC in 1997. The undergraduate program and LDC complement each other, and both support the institutional mission. In 1999 the courses offered through the LDC were evaluated and granted American of Council of Education (ACE) course credit recommendations.

Other governance is provided by a congressional Board of Visitors, composed of three senators and five congressmen, which is authorized to review the academy's programs, curricula, and facilities. The superintendent is aided by the senior management team (SMT), comprising the dean, the commandant of cadets, and other senior staff members. Together they provide for the strategic management of the academy as well as the day-to-day administration.

The dean administers the academy's academic division, encompassing more than 100 full-time faculty and a number of staff. The commandant of cadets serves as a dean of students and has a central role in maintaining commissioning standards. The athletic director oversees student physical development and the National Collegiate Athletic Association Division III sports programs. Other senior leaders manage admissions and business processes. Several boards advise the superintendent. They include the Academic Council, Faculty Senate, Curriculum Committee, Credentials Committee, Resources Allocation Board, Cadet Academic Advisory Board, and others.

## Admission

The Coast Guard Academy is one of the most selective schools in the nation, enrolling about 300 young men and women, who are selected from more than 6,000 applicants. The 900 cadets who make up the corps are competitively selected from across the country, as well as twenty from foreign countries. The LDC serves about 3,000 adult learners per year

through short courses or programs. The faculty supporting the LDC and the cadets are both military and civilian.

The Coast Guard Academy is committed, as proclaimed in its vision statement, to be the "well-spring of leadership and character for the United States Coast Guard. In serving the American public, the Academy is recognized as an exemplary institution and valued national asset. To earn that recognition and inspire life-long learners, CGA excels in education and military training, and leadership development."

## U.S. MERCHANT MARINE ACADEMY

The U.S. Merchant Marine Academy is one of five federal service academies. It is operated by the Maritime Administration, an agency of the U.S. Department of Transportation. The Merchant Marine Academy is located on an eighty-two-acre waterside campus in Kings Point, New York, about twenty miles from New York City on the north shore of Long Island. The academy is commonly referred to as *Kings Point*. It offers a four-year program leading to a bachelor of science degree and is accredited by the Middle States Association of Colleges and Schools. The academy includes the Global Maritime and Transportation School, which was established in 1994 to meet the continuing education and training needs of professionals from the commercial and military maritime transportation industry.

Each graduate of the academy is awarded a license as a third mate or third assistant engineer in the U.S. Merchant Marines; academy graduates are also commissioned as ensigns in the U.S. Naval Reserve. In 2001 the student body numbered about 950, with approximately 750 in residence at Kings Point and the rest in training aboard ships at sea. The academy was established to prepare young

American men, and later women, for careers as deck or engineering officers aboard ships of the U.S. Merchant Marine. One of the conditions for admission is the signing of an agreement to serve as a licensed officer in the U.S. Merchant Marine for at least five consecutive years after graduation.

The U.S. Merchant Marine consists of all commercial U.S. flag vessels and crews engaged in the foreign and domestic transport of cargo and passengers. Although the ships are owned and operated by private shipping companies, they provide logistics support to the U.S. military services in times of emergency; accordingly, the U.S. Merchant Marine is often called the “fourth arm of national defense.”

Each Kings Point graduate joins a ship as a fully qualified junior officer and immediately takes charge of a watch on the bridge or in the engine room. Deck officers are responsible for navigation, cargo handling, vessel maintenance, and shipboard safety. Engineering officers are responsible for maintaining and operating all the ship’s machinery, including propulsion, auxiliary, refrigeration, and deck equipment.

### Curriculum

The educational program of the U.S. Merchant Marine Academy consists of three years ashore at Kings Point and one year spent at sea aboard merchant ships. Each academic year is eleven months in duration, with a rigorous program of study in order that professional and degree requirements may be met within the three-year period ashore. The academy’s academic year is divided into three trimesters.

Students at the Merchant Marine Academy are called *midshipmen*, a term that applies to both men and women. Midshipmen can select one of seven major programs of study: marine transportation, marine operations and technology, logistics and intermodal transportation, marine engineering, marine engineering systems, marine engineering and shipboard management, or dual license. Each program leads to a bachelor of science degree. The challenging dual-license program, available only to top students, combines marine engineering and marine transportation studies and leads to licensing in both specialties. This program was pioneered by the academy in 1965, in anticipation of technological changes in the industry that would call for highly trained officers possessing both deck and engineering proficiency.

At the end of their fourth year of study, all midshipmen must pass a comprehensive written examination, after which they are licensed as either deck officers or engineering officers, depending on their major. In addition to the attainment of maritime professional excellence, midshipmen are provided with mathematical and scientific knowledge and a basic general education that includes the study of history, English, business, economics, and humanities. Such a broad education prepares midshipmen for executive positions when they move ashore after careers at sea.

Students majoring in marine transportation, logistics and intermodal transportation, or maritime operations and technology study a curriculum that includes such professional subjects as seamanship, communications, navigation, naval architecture, meteorology, safety of life at sea, cargo handling, gyrocompass principles, electronics, international law of the sea, and marine transportation. Students in one of the three engineering majors study such technical subjects as machine shop, engineering graphics, marine machinery repair, statics, dynamics, thermodynamics, strength of materials, hydraulics, internal combustion engines, marine refrigeration and air conditioning, electrical engineering, and marine engineering. Each curriculum also includes a certain number of hours in mathematics, physics, chemistry, English, history, foreign languages or comparative culture, business and economics, maritime law, labor relations, marine insurance, ship’s medicine, physical education, and naval science. Each curriculum is composed primarily of required courses, though a midshipman with the necessary academic standing may add one elective course each trimester.

Transfer credit may be awarded for any course completed at another college that is equivalent to a course offered at the academy. Validation credit may also be awarded in certain subjects upon passing an examination administered at the academy. A student may then substitute courses from the list of electives to complete the academic program.

Because the U.S. Merchant Marine operates with the U.S. Navy in time of war, an understanding of naval procedures by its officers is essential to successful cooperation. Candidates for admission to the Merchant Marine Academy must meet the qualifications for naval reserve midshipmen. All midshipmen take a prescribed program of naval science courses, taught by naval officers, which leads to a commis-

sion, upon graduation, as an ensign in the Merchant Marine Reserve/U.S. Naval Reserve. The graduate is then under obligation to remain in the naval reserve for eight years and to maintain his status by completing correspondence courses and undergoing training duty.

### Sea Year

After one year at the academy, during which midshipmen take introductory courses in all areas of study, they are assigned to several different types of U.S. flag merchant vessels for three nonconsecutive trimesters during their second and third year of training. Midshipmen who are interested in a naval career may also train aboard U.S. Navy ships. This is a unique work-study situation in which the ship serves as a laboratory. Midshipmen are introduced to life at sea, and they become familiar with the work done aboard ocean vessels. In addition, they are issued a sea project manual containing assignments that they must complete and forward to the academy for grading. Midshipmen also receive voluntary instruction from ships' officers while observing and performing some of the duties of a junior officer. Academy training representatives in New York, New Orleans, and San Francisco assign midshipmen to the ships and oversee their progress.

### Regimental Life

The academy is military in character, and midshipmen are organized into a regiment. The regimental program provides an opportunity to practice leadership as midshipmen officers, a system of strict discipline in which infractions of regulations incur demerits and punishment, and the standing of watches. Regimental life is considered essential to the development of leadership ability, self-discipline, a sense of responsibility, and the ability to adapt to the rigorous life at sea.

In addition to participation in the military routine of the regiment, the Kings Pointer may take part in student government and such extracurricular activities as publications, musical groups, special interest and hobby clubs, debates, and social affairs. An arts and world affairs series brings a program of cultural activities to the campus throughout the year. Participation in religious activities and attendance at services in the Merchant Marine Memorial Chapel are voluntary. In addition, there are intramural athletic programs and scheduled intercollegiate competitions. Liberty is granted as a matter of privilege.

### Admission

The academy selects 266 men and women for admission annually. Candidates for admission must be U.S. citizens between the ages of seventeen and twenty-five. Appointment to the academy begins with an application to the appropriate nominating authority, usually a U.S. senator or representative from the candidate's home state, who officially requests that the applicant's name be submitted in nomination to become a candidate for admission. A candidate must meet general and scholastic requirements, including high school graduation or its equivalent and qualifying ACT Assessment or SAT scores.

Candidates are ranked in order of merit by an objective evaluation of all credentials. They are then competitively selected to fill academy vacancies through a quota system based on each state's representation in Congress. The candidate must then pass a physical examination conducted by the U.S. Navy for appointment as a midshipman in the U.S. Naval Reserve, and must also meet security requirements. The academy also admits up to thirty students from Latin America and certain other foreign countries.

The U.S. government bears the major portion of academy costs, including tuition, quarters and subsistence, and medical and dental care. While at the academy, each midshipman receives a yearly allowance for required uniforms and textbooks. During the sea year, a monthly salary is paid by the shipping companies.

### History

The U.S. Merchant Marine Academy was developed from a program of merchant-marine officer training that began in 1891 when the federal government authorized the assignment of cadets aboard ships receiving mail. When the handling of training by shipping companies proved unsatisfactory, the federal government passed the Merchant Marine Act of 1936, which provided for the establishment in 1938 of the U.S. Merchant Marine Cadet Corps. The training program was conducted solely aboard ship at first, but temporary shore facilities were soon established. Construction of a permanent academy was begun in January 1942 at the Walter P. Chrysler estate, whose thirteen acres form the nucleus of the present campus. The academy was dedicated on September 30, 1943. In his dedicatory message, President Franklin D. Roosevelt summed up the purpose

of the academy: “This academy serves the Merchant Marine as West Point serves the Army and Annapolis serves the Navy.”

During World War II, the academy berthed at one time as many as 2,700 cadets taking an abbreviated curriculum that included training aboard ships in combat zones. The academy graduated 6,634 officers during the war. The four-year course was instituted with the class entering in September 1945, and authorization to grant a bachelor of science degree was granted by Congress in 1949. A 1956 act of Congress made the academy a permanent institution.

The academy accelerated training to supply officers during the Korean War and the Vietnam War. The academy was also involved in training officers for the country’s first nuclear-powered merchant ship, the *Savannah*. In 1974 the Merchant Marine Academy became the first federal service school to admit women. Before and during the 1991 Persian Gulf conflict, academy graduates and midshipmen aided the extensive sea-lift of troops and military supplies to the Middle East. Academy midshipmen and graduates also provided support for military actions in Somalia and Haiti during the 1990s.

### U.S. MILITARY ACADEMY

The U.S. Military Academy, located in West Point, New York, is a postsecondary educational institution

operated under the general direction and supervision of the U.S. Army. The academy, usually referred to as *West Point*, occupies a 2,500-acre campus, which is augmented by about 15,000 acres of adjacent government-owned land. The mission of the academy is to train selected young men and women for careers as officers in the regular army of the United States. Successful completion of the four-year course leads to a bachelor of science degree and a commission as a second lieutenant in the U.S. Army. The academy has an enrollment of about 4,000 students; approximately 15 percent of whom are women.

#### Curriculum

The West Point curriculum includes a combination of academic, military, and physical training. The core academic curriculum, which focused largely on engineering in the past, now includes a balance of arts and sciences. Although most of the curriculum is prescribed, there is some flexibility that permits cadets to pursue particular interests and aptitudes. Class size is small, usually numbering between fourteen to eighteen students.

Every cadet must complete thirty-one courses that make up the academy’s core curriculum. Cadets must also complete at least nine elective courses, chosen to support a major or a field of study. In 2001 the academy offered twenty-five fields of study and twenty-two majors, most of which were related to engineering, foreign area and foreign language studies, or modern history and political science. Cadets choose a major (which requires ten to thirteen elective courses) or field of study (which requires only nine electives) at the end of their second year.

The total curriculum is designed to develop the qualities of character, intellect, and physical competence needed by army officers, who at various stages of their careers must be prepared to lead the smallest combat unit or to advise the highest governmental official. In order to achieve this goal, the curriculum is rounded out by military and physical training, in addition to the academic stress on science and the humanities. The total program provides a sound foundation for both graduate education and professional development.

Military training at West Point is designed to provide a comprehensive knowledge of military fundamentals and doctrine, as well as proficiency in basic military skills. The student body is organized

as a *brigade* under the command of a brigadier general known as the Commandant of Cadets. The brigade is led by a professional officer and a cadet chain of command. By serving in various positions of responsibility within the corps of cadets, cadets are given opportunities to apply their knowledge and to improve their leadership abilities. This portion of a cadet's training, including both practical military training and military-science instruction, is the foundation for more specialized postgraduate training in armor, infantry, engineering, signal corps, field artillery, air defense artillery, military intelligence, or another of the various branches of military science.

Most of the academy's military training occurs during the summer months. New cadets (called *plebes*) undergo Cadet Basic Training during their first six weeks at the academy. Sophomores (*yearlings*) complete eight weeks of intensive field training at Camp Buckner, located near West Point. Juniors (*cows*) engage in specialized military training, such as airborne, air assault, northern warfare, or mountain warfare at various locations and military bases around the world. Seniors (*firsties*) learn military leadership skills by helping direct military training for plebes and yearlings.

The academy's rigorous physical training program continues throughout the entire year. Each cadet participates every season in either intramural or intercollegiate athletics. Formal instruction includes courses in coaching techniques, which provide the basis for another valuable dimension of leadership.

As part of their military and physical curriculum, cadets undergo training in ethics and morals. Such training supports the West Point Honor Code: "A cadet will not lie, cheat, steal, or tolerate those who do." Moral and ethical training is also buttressed by formal instruction in important military values, voluntary religious programs, and a guest speaker program.

### Admission and Military Obligation

All men and women who meet academic and physical requirements may apply to West Point, but admission is extremely competitive. Above-average high school records, demonstrated leadership skills, strong performance on the ACT Assessment or SAT college entrance examinations, physical aptitude tests, and medical tests are prerequisites. In addition,

an applicant must be between the ages of seventeen and twenty-two, neither married nor pregnant nor carrying the legal obligation to support a child, and a citizen of the United States. Naturalized American citizens must provide proper documentation to be considered for admission. A small number of foreign students may be nominated by formal agreement between the U.S. government and another country.

Procedures for admission to the academy differ in several respects from those of civilian educational institutions. A prospective candidate cannot apply directly to the academy for admission, but must first secure a nomination from an authorized source, usually a United States representative or senator from the candidate's home state, or the secretary of the army. By law, these officials are authorized to nominate up to ten young people to compete for vacancies at the military academy each year. After nomination, candidates receive permission to undertake the examinations for appointment, which determine their academic, medical, and physical qualifications. Classes enter the academy in July of each year. Every cadet enters as a plebe. Transfer credit is not given for college work completed prior to entry into West Point.

Upon entering the academy, a cadet takes an oath committing to a military obligation of six years, the first five on active duty. Upon graduation and appointment as a second lieutenant in the regular army, the West Point graduate serves the five-year active-service commitment. If a cadet is separated after he or she has started the first academic term of the second class year (except for physical disqualification, unfitness, or unsuitability), he or she is subject to transfer to the reserve or ordered to active duty in an enlisted status.

### Cadet Life

The daily life of a cadet, apart from academic instruction, is centered on the cadet's company in the corps of cadets. Cadets live in barracks, stand formation, and participate in intramural athletics as a member of this company. There are approximately 110 cadets in a company, with equal membership from all four classes. A cadet company commander, subordinate cadet officers, and noncommissioned officers are responsible for the military formations and many of the daily administrative matters. Every company is assigned a tactical officer who is specially selected on the basis of his or her commissioned ser-

vice in the regular army and proven leadership ability to counsel and advise cadets.

An integral part of daily life within the corps of cadets is the honor system. The system and the honor code upon which it is based are fundamental to the stress placed upon personal integrity. Every day, cadets see their work or signature accepted as final proof for authorized absences, for compliance with instructions, and as certification of accuracy.

No tuition is charged for attendance at the academy. Cadets are considered members of the regular army and receive stipends of about \$600 per month, enabling them to buy uniforms, books, and supplies. In effect, each cadet receives a full scholarship.

## History

The U.S. Military Academy is the oldest service academy in the nation. Troops were first garrisoned at West Point during the Revolutionary War, and the military academy was established there in 1802. George Washington was among the revolutionary leaders who strongly felt that a national military academy was needed to eliminate reliance on foreigners for training Americans in artillery, engineering, and other military skills. Initially, the corps of engineers operated the academy and was responsible for training officers in all branches of the service. Because provisions were made for the study of many branches of science, the U.S. Military Academy became the first national center for scientific engineering.

After the War of 1812 came a period of academic pioneering that laid the foundation for the methods and standards that still exist at West Point. Colonel Sylvanus Thayer, superintendent from 1817 to 1833, made courses in civil engineering the academic center of the curriculum. In his endeavor to produce trained leaders, Thayer strove for excellence in personal qualities that went beyond the sound practical knowledge his program of instruction imparted. The subsequent impact of the graduates he trained upon the internal communications of the fledgling nation was widely recognized. The construction of canals, railroads, and harbors under the leadership of men schooled at West Point greatly accelerated the emergence of the United States as a unified country.

Although the primary purpose of the academy was to provide professionally trained officers, its secondary role as a national school of civil engineering

continued until after the Civil War, when academy graduates served in both the Union and Confederate armies. In 1877 Henry O. Flipper, a native of Georgia, becomes the first African American to graduate from the academy. During the post-Civil War period, the proliferation of civilian engineering and technical schools created alternate means of training the engineers needed throughout the United States. In response, West Point shifted its academic emphasis from civil engineering to a pattern of courses affording a broader education. In 1889 Antonio Barrios became the first Hispanic to graduate from West Point; Barrios later served in the Guatemalan army, where he rose to the rank of general.

The emphasis on a broad, general education was maintained in subsequent revisions of the curriculum after World War I, World War II, and the Korean conflict. The expansion of the army's role in international affairs provided additional reasons for increased attention to the academic disciplines of history, geography, economics, and the social sciences. In 1964 President Lyndon Johnson signed legislation permitting the academy to accept nearly 2,000 additional cadets each year, and a major project to expand facilities ensued. During the 1970s and 1980s the curriculum was revised to permit cadets more academic options, including the choice to major in a wide range of disciplines. Women cadets were first admitted to the academy in 1976. During the 1980s and 1990s an increasing number of woman and minorities were admitted.

Notable West Point graduates include Ulysses S. Grant (1843), Jefferson Davis (1828), Robert E. Lee (1829), George Meade (1835), William Tecumseh Sherman (1840), Thomas J. "Stonewall" Jackson (1846), John J. Pershing (1886), Douglas MacArthur (1903), George S. Patton (1909), Omar Bradley (1915), Dwight D. Eisenhower (1915), Brent Scowcroft (1947), Edwin E. "Buzz" Aldrin (1951), and H. Norman Schwarzkopf (1956).

DEAN W. MEYERSON  
Revised by  
JUDITH J. CULLIGAN

## U.S. NAVAL ACADEMY

As the undergraduate college of the U.S. Naval Service, the Naval Academy prepares young men and women to become professional officers in the U.S. Navy and the U.S. Marine Corps. Naval Academy students are midshipmen on active duty in the U.S. Navy. They attend the academy for four years, graduating with bachelor of science degrees and reserve commissions as either ensigns in the Navy or second lieutenants in the Marine Corps. Naval Academy graduates serve at least five years as Navy or Marine Corps officers.

The scenic Naval Academy campus, known as the “Yard,” is located in historic Annapolis, Maryland, where the Severn River flows into the Chesapeake Bay. With its combination of early twentieth-century and modern buildings, the Naval Academy is a blend of tradition and state-of-the-art technology that exemplifies the Navy and Marine Corps in the early twenty-first century. Throughout the Yard, tree-shaded monuments commemorate the bravery and heroism that are an inherent part of the academy’s heritage. Buildings and walkways are named for Naval Academy graduates who have contributed to naval history and their nation.

The Naval Academy is also the final resting place of Revolutionary War naval hero John Paul Jones. A National Historic Site, the Naval Academy hosts more than 1 million tourists every year from the United States and around the world.

### History

Founded in 1845 by Secretary of the Navy George Bancroft, the academy started as the Naval School on ten acres of old Fort Severn in Annapolis. Since then,

the development of the Naval Academy has reflected the history of the United States. In 1850 the Naval School became the U.S. Naval Academy. A new curriculum went into effect requiring midshipmen to study at the academy for four years and to train aboard ships each summer. That format is the basis of what has evolved into a far more advanced and sophisticated curriculum at the Naval Academy. As the U.S. Navy grew over the years, the academy expanded. The campus of ten acres increased to 338. The original student body of fifty-five midshipmen grew to a brigade of 4,000, and modern granite buildings replaced the old wooden structures of Fort Severn and the Naval School.

Congress authorized the Naval Academy to begin awarding bachelor of science degrees in 1933. The academy later replaced a fixed curriculum taken by all midshipmen with a core curriculum plus eighteen major fields of study, a wide variety of elective courses, and advanced study and research opportunities.

### Mission and Program

The Naval Academy’s official mission is “to develop midshipmen morally, mentally and physically and to imbue them with the highest ideals of duty, honor and loyalty in order to provide graduates who are dedicated to a career of naval service and have potential for future development in mind and character to assume the highest responsibilities of command, citizenship and government” (U.S. Naval Academy). This gives everyone—faculty, staff, and midshipmen—the same focus. It also encourages a sense of spirit and pride found at few other schools.

The moral, mental, and physical elements of the Naval Academy program are equally important, all contributing to the qualities of an outstanding naval officer. Each midshipman’s academic program begins with a core curriculum that includes courses in engineering, science, mathematics, humanities, and the social sciences. This is designed to give a broad-based education that will qualify midshipmen for practically any career field in the Navy or Marine Corps. At the same time, the majors program provides students the opportunity to develop a particular area of academic interest. For especially capable and highly motivated students, the academy offers a challenging honors programs and an opportunity to begin a postgraduate degree while still at the academy.

After four years at the Naval Academy, the life and customs of naval service become second nature. First, a student learns to take orders from practically everyone, but before long, students acquire the responsibility for making decisions that can affect hundreds of other midshipmen. Professional classroom studies are backed by many hours of practical experience in leadership and naval operations, including assignments with Navy and Marine Corps units during the summer months.

Moral and ethical development is a fundamental element of all aspects of the Naval Academy experience. As future officers in the Navy or Marine Corps, midshipmen will someday be responsible for the lives of many men and women and multimillion-dollar equipment. From “Plebe Summer” through graduation, the Naval Academy’s Character Development Program is a four-year integrated continuum that focuses on the attributes of integrity, honor, and mutual respect. One of the goals of this program is to develop midshipmen who possess a clearer sense of their own moral beliefs and the ability to articulate them. Honor is emphasized through the Honor Concept of the Brigade of Midshipmen—a system that was originally formulated in 1951 and states: “Midshipmen are persons of integrity: they stand for that which is right.” These Naval Academy “words to live by” are based on the moral values of respect for human dignity, respect for honesty, and respect for the property of others. Brigade Honor Committees composed of elected upperclass midshipmen are responsible for education and training in the Honor Concept. Midshipmen found in violation of the Honor Concept by their peers may be separated from the Naval Academy.

The Naval Academy teaches the importance of being physically fit and prepared for stress because the duties of Navy and Marine Corps officers often require long, strenuous hours in difficult situations. The physical requirements of Plebe Summer training, four years of physical education, and year-round athletics also develop pride, teamwork, and leadership.

### Profile of Midshipmen

It takes a special kind of young man or woman to handle the Naval Academy’s demanding program, but that doesn’t mean all midshipmen are alike. Midshipmen come from all fifty states, from U.S. territories, and from several foreign countries. They have roots in cities and suburbs, farms and ranches,

small towns and military bases. Midshipmen are good students, leaders in their high schools and communities, and participants in competitive sports. The young men and women who choose the Naval Academy are looking for more than a college degree, however—they like the idea of being challenged morally, mentally, and physically.

## MILITARY PROFESSIONAL EDUCATION SYSTEM

---

Career military officers and noncommissioned officers (NCOs) of the Armed Forces of the United States are the beneficiaries of sequential, regularly scheduled periods of professional education. Military leaders return full-time to the “schoolhouse” every three to five years during a twenty-plus year career. Each of these in-residence educational experiences lasts from two months to a year or longer. When coupled with advanced civil schooling, self-study, and on-the-job learning, these courses provide the officer or NCO with the theoretical and practical knowledge needed for duties of increasing complexity and scope as she or he advances in rank. For the sake of brevity, the U.S. Army’s Officer Professional Military Education (OPME) and Noncommissioned Officers Education System (NCOES) will be used here as examples.

Professional military education focuses on leadership, management theory and practices, military history and operational doctrine, national defense policy, planning and decision-making, legal responsibilities, and professional ethics. Academic evaluations are primarily performance-oriented, with criteria and learning conditions prescribed for each task. Frequent informal feedback and periodic in-depth performance evaluations are provided. Emphasis is on enhancing the ability to function effec-

tively as a leader and team member, and in staff positions of combined arms and joint service organizations.

For the majority of commissioned officers, professional education begins with the precommissioning phase, which is completed at one of the service academies (U.S. Military Academy, Naval Academy, Air Force Academy, or Coast Guard Academy) or through a Reserve Officers Training Corps (ROTC) program at a participating college or university. Officer Candidate Schools provide opportunities for selected enlisted members of the various services to complete the requirements for commissioning. These educational programs prepare young men and women to assume the responsibilities of junior officers (second lieutenants in the Army, Air Force, and Marines and ensigns in the Navy and Coast Guard) in active-duty (full-time), Reserve, or National Guard units.

For enlisted members of the Armed Services, professional education begins with basic training, or boot camp, followed by advanced technical training in one of the many occupational and vocational fields required by increasingly complex and technologically advanced organizations. Members receive a Military Occupational Specialty (MOS) designation upon successful completion of this training. The military-skill training component of precommissioning programs has much in common with basic training. Following an initial tour of duty, selected Army enlisted members attend the NCOES Basic Course, which focuses on small-unit leadership.

The second phase of OPME focuses on the technical and tactical duties of junior officers specific to each branch and service. Army lieutenants attend the Officers Basic Course for their initial branch assignment, such as the Armor Officers Basic Course at Fort Knox, Kentucky. Marine Corps officers attend their infantry-oriented basic course at Quantico, Virginia, and then may attend a specialty course such as the Army's Artillery School at Fort Sill, Oklahoma. Naval ensigns selected for Surface Warfare or Submarine Service attend basic courses in their specialty. Officers selected for flight training attend flight school. Some officers attend special qualification courses such as the U.S. Army Ranger School, material maintenance programs, nuclear propulsion, or language school prior to their first unit assignments. Officers Basic Courses provide the functional equivalent of enlisted MOS certification

and the tactical leadership training provided during the Basic NCO Course.

After completing three to five years of service with troop units, Army officers attend a two-phased Captains Career Course. Phase one is a branch-specific advanced course that prepares attendees for command of companies, batteries, or troops (military units ranging in size from 60 to 200 soldiers), and for technical and staff responsibilities at battalion and brigade levels. Experiential, case-based interactive learning with extensive use of simulation devices and practical field applications predominate the instructional methodologies.

Immediately following completion of phase one, Army officers attend phase two, the six-week Staff Process Course at the Combined Arms and Services Staff School (CAS3). CAS3 employs small-group instruction techniques designed to improve an officer's ability to analyze and solve problems, communicate orally and in writing, interact effectively as a key member of a military staff, and to apply operational doctrine and procedures in the field. Each staff group is composed of twelve students from combat, combat support, combat service support, and specialty branches in order to encourage interdisciplinary thinking and combined arms doctrine. Naval officers attend similar courses to prepare them for duty as divisional officers on board ships and submarines, and for staff positions. In preparation for assuming duties as platoon sergeants, staff specialists, and first sergeants, noncommissioned officers attend the installation-based Advanced Noncommissioned Officer Course (ANCOC).

Selected Army officers receive education in non-branch-related functional areas—such as Systems Automation, Army Acquisition Corps, and Foreign Area Specialties at residential military schools—through the Advanced Civil Schooling program, which includes the Technological Enhancement Program, or through Training With Industry. Most midcareer officers complete advanced academic degrees through government-funded programs on duty time or personally financed off-duty study, while many noncommissioned officers complete associate and bachelor's degrees while off duty. Today, the American military is unique among the armies of the world in its high percentage of officers with master's degrees and Ph.D.s.

The fourth stage of OPME is the Command and General Staff College (CGSC). Attendance at resi-

dent CGSC is selective and prepares officers for command at battalion and brigade levels and for senior staff positions. Nonresident/distance learning CGSC courses are also offered for active-duty, Reserve, and National Guard officers.

Selected officers attend a *sister service* CGSC level course (i.e., Air Command and Staff College) or an allied national institution such as the British Staff College. Emphasis is placed on planning and direction of joint (multiservice) and combined (multinational) operations, in accordance with the congressionally mandated Phase I of the Joint Professional Military Education Program (DOD Reorganization Act of 1986). Selected officers attend the Joint Forces Staff College as Phase II of this program. A small group of officers is chosen to participate in a second year of intensive study at the School of Advanced Military Studies at Fort Leavenworth, Kansas, focusing on military history and the art of war, computerized war games, research, and doctrinal writing.

Army officers selected for command at battalion and higher levels attend pre-command courses in preparation for these demanding assignments. The Noncommissioned Officer Education System equivalent of CGSC and pre-command courses is the Sergeants Major Academy. This final stage of NCOES prepares highly qualified senior NCOs for service as Command Sergeants Major and as senior staff assistants.

Attendance at one of the Senior Service Colleges is the final stage of OPME. Emphasis is on strategic planning, policy, national security decision-making, and joint and combined military operations. Some officers pursue Senior Service College Fellowship studies at leading universities such as Harvard and Georgetown, at the NATO Defense College, and at interdepartmental courses such as the Advanced Operational Studies program, the Defense Systems Management College, or the Center for Strategic and International Studies.

## MILITARY TRAINING DOCTRINE, PHILOSOPHY AND PRACTICE

The training of armies as a systematic educational practice has ancient roots. While other trades, crafts, and vocations are often individual pursuits, organized warfare requires the common training of vast numbers to produce synchronized efforts and predictable responses under stress. The evolution of military training doctrine and professional education in the United States provides a model of experimentation, advances, and rediscoveries in pedagogical practices and learning theory. As in the case of research and practical applications in medicine, engineering, technology, management, and organizational leadership, military professional education and training have been a proving ground for innovations. For the sake of brevity, the training doctrine of the U.S. Army will serve here as the primary example.

Doctrinal debates abound in the history of military training. Military educators have assessed the relative efficacy of rote memory and static knowledge, as opposed to creativity and dynamic knowledge. They have struggled with the choice between a single proven solution and situational initiative; that is, between rigid routine and fixed practice and standardized yet flexible techniques. They have appraised lecture/discussion-based learning and, for many skills, found experiential and case-based learning preferable. Simulations (war games), service learning, internships, and apprenticeships are longstanding practices. And in the evolving relationship between teacher and student, military trainers have moved away from an authoritarian, directive mode to a more participative learner model of shared expertise.

## History of Military Training in the United States

Friedrich von Steuben, a Prussian volunteer serving as George Washington's inspector general during the Revolutionary War, composed the first uniquely American training doctrine. Steuben brought his organizational energy and negotiation skills to the struggling Continental army at Valley Forge during the winter of 1777–1778. His ability as a teacher and trainer were anchored in his genuine concern for individuals, his personal integrity and sense of humor, and a keen perception of the character of Americans. He earned the trust of both Washington and the common soldier.

Steuben saw the Continentals as real soldiers, but of a new type—quick learners, likely to respond favorably to participative, practical, caring, and adaptive leadership, and to the discipline of a trained team. He instituted three essential reforms. First, he put commissioned officers in charge of training, insisting that they lead their men in training as they would in battle. He also advised that officers care for their soldiers. In his drill regulations, published in 1779, Steuben wrote: “A captain can not be too careful of the company the State has committed to his charge. He must pay the greatest attention to the health of his men, their discipline, arms, accouterments, clothes and necessaries” (Moss, p. 259). This dual focus enhanced the proficiency of both leader and those being led, while reinforcing the bond between them—a view reflected in the modern principle “mission first, soldiers always.”

Second, Steuben prescribed an overhaul of army discipline, supply accountability, and manpower utilization. Soldiers scattered on various fatigue details and serving as officers' servants were returned to tactical units for training—a principle reflected in the current practice of priority training periods. He understood more clearly than Washington that European methods of discipline could not be imposed on the American army. Initiative, self-reliance, and a desire to know the *why* behind an order or a procedure were foundations of the American character. Steuben believed training for collective action had to be built on these entrepreneurial characteristics, and not designed to eliminate them.

Finally, Steuben standardized and simplified battle formations, tactics, and drills. He developed a manual of arms that reduced the steps in loading and firing muskets, taught the practical use of the bayonet, and trained the army to march in columns

of four rather than in long, rambling single file. His teaching methods were insightful. He recruited 100 men of robust constitution for a demonstration guard company. With the assistance of carefully selected sub-inspectors, Steuben personally trained one squad in the new manual of arms and movement techniques, then supervised the drilling of other squads by the sub-inspectors. Once the squads were trained, he drilled them as a company, starting each day with squad drills and ending with company exercises—the beginnings of what now is called multi-echelon, progressive, or integrated training.

Many officers and soldiers came to watch Steuben's “parades” and were impressed. Washington directed that unit commanders adopt Steuben's model and appointed training inspectors coached by Steuben to oversee training throughout the Continental army. In a sense, these inspectors became the master teachers of their day—Steuben's concepts of teaching and learning have much in common with those of the twentieth-century educational philosopher John Dewey.

Steuben's innovations ran counter to a trend all too common in military history. Rigid adherence to outdated concepts of operational doctrine, including tactics and training methods that do not reflect the changing nature of military weapons and of warfare itself, has repeatedly proven costly, both in terms of military objectives and the lives of soldiers. Experience yields valuable lessons to those willing to learn. Unfortunately, many lessons are forgotten, only to be relearned by later generations.

One excellent example is that of Emory Upton, an 1861 graduate of West Point who rose to the rank of brevet major general in the Union army. Upton solved the problem of assaulting entrenchments defended by men with rifled muskets. In contrast to massed formations of soldiers marching shoulder to shoulder in the open, Upton employed four-man assault teams that moved independently, in short rushes, while other teams engaged the enemy—a technique today called *fire and movement*.

Trained to work together, taking advantage of cover and concealment and relying more on speed, surprise, and teamwork than on firepower, Upton's four-man team was the precursor of the modern infantry squad and an early model of the self-managed learning and production teams of today. European armies ignored Upton's lesson until the last year of World War I, when, in response to lethal battlefield

conditions, both German and American assault troops devised innovative infiltration tactics employing interdependent teams.

### The Post-Vietnam Era

The post-Vietnam era was a time of deep reflection for military professionals. The persistent threat of the cold war, however, did not allow for near-total demobilization and a return to isolationism, as had repeatedly occurred in the past. In the 1970s, the challenge facing military leaders was to train a force that would be fully prepared to fight in a “come as you are” war—one without a lengthy mobilization period.

A method had to be found to institutionalize experiential learning. The practical classroom of combat repeatedly reveals the strengths and deficiencies of military training. Standardized training schedules and techniques, fixed tactical solutions, and common doctrine—efficient in teaching the “book solution” and easy to evaluate—are often not effective in preparing leaders or soldiers to deal with new missions, unique environmental conditions, and the uncertainties of combat.

To meet this challenge, operational doctrine, recruiting methods, and training techniques required major revisions. The U.S. Army’s Training and Doctrine Command (TRADOC) was established in 1973 as the single proponent for training reforms, doctrine revision, leader development, and the modernization of organizational structure, weapons, and equipment. William DePuy, the first Commanding General of TRADOC, recognized that the United States must be able to fight and win the “first battle of the next war.” The Arab-Israeli War of 1973 provided a vivid example of modern warfare’s speed and lethality, and its sudden onset allowed no time for the shallow seasoning (learning) curve of earlier wars.

DePuy’s World War II and Vietnam experiences convinced him that the root cause of first-battle failures was combat training “by the numbers,” where “learning and relevance were secondary to scheduling” (Scales, p. 11) and leadership development lacked demands for realistic combined-arms synchronization in the uncertainty of the battlefield. He initiated doctrinal changes that focused on a systems approach of “training to task, not to time” that educated leaders to optimize the advances in weapons and mobility, seeking to steepen the prewar season-

ing curve. A parallel civil education reform is the shift from accumulating Carnegie units (number of hours per subject) to block scheduling and interdisciplinary, across-the-curriculum learning.

In the mid-1970s, Army Training and Evaluation Programs (ARTEP) and soldier’s manuals replaced earlier training schedules. Each individual and unit task was analyzed, specified, and defined by measurable performance standards and the conditions under which it would be performed. Evaluations stressed actual performance under field conditions. Skills mastered at each level contributed to effectiveness at higher levels. Doctrinal innovations reflecting the realities of modern warfare were integrated into a series of *how to fight* and *training the force* manuals used to guide learning and actual operations.

Under the new doctrine, individual and unit training takes full advantage of techniques that are gaining acceptance in civilian schools and organizational settings. Internship experiences are provided to cadets and midshipmen. Initial tours of duty have a strong apprenticeship focus, while service learning (that is, learning from practical experience in an applied setting under the guidance or coaching of a trainer or teacher) is the norm. Theory and principles taught in the classroom are habitually applied and evaluated in field settings under expert supervision. Computer-assisted instruction and simulations, as well as distance learning organized under corresponding studies programs, are used extensively. Annual performance evaluations for leaders are anchored in individually prepared professional development plans. Across disciplines education is mandated by combined arms and joint operations doctrine.

The slogan “train as you will fight” gained credence with the adoption the Multiple Integrated Laser Engagement System (MILES) for tactical training. Eye-safe laser projectors were developed to match weapons from rifles to tank cannons; laser sensitive target arrays were rigged to soldiers’ field gear and to vehicles; and computers recorded hits and near misses. MILES allowed, for the first time, force-on-force exercises that realistically simulated combat.

### Evaluation of Training Methods

Inspired by the Navy’s Top Gun program, the Army began tactical unit training evaluations at Fort

Irwin's National Training Center (NTC) in the early 1980s. MILES-equipped companies and battalions, linked into a computerized Core Instrumentation System supported by video cameras, radio monitors, and experienced controllers, engaged a numerically superior opposing force (OPFOR) in a "no-holds-barred battle" that tested individual and unit tactical skills and the real-time decision-making skills of commanders and their staffs.

The learning value of the NTC and other similarly equipped centers results from the direct experience of no-nonsense combat simulations and the cumulative effects of candid and detailed After Action Reviews (AARs). During an AAR, leaders' decisions, and their consequences, are evaluated using automated records of actions, controllers' observations and, significantly, the memories of unit participants. AARs are professional, collective reflections, and can be very humbling experiences. No other army exposes commanders to such a skilled opposing force and then reveals the results of the field exercise to that commander's subordinates and peers. Each NTC experience produces lessons learned that are actively shared.

As a key tool for learning from experience, the AAR technique is also applied to computer-assisted free-play simulations called Battle Command Training Programs (BCTPs), which are used to evaluate commanding generals and their staffs. To deal with the highly sensitive issue of such public assessments of senior officers, each BCTP simulation and its AAR is supervised by three retired four-star generals.

Evaluation and professional reflection are not limited to the NTC and BCTP. Mission-essential tasks, defined in each unit's ARTEP, are evaluated against measurable standards during AARs conducted after each training event. This commitment to honest feedback has instilled an institutional obsession to train realistically for combat and to learn from the experience. As vividly demonstrated by the Persian Gulf war and operations throughout the 1990s, units realistically trained prior to actual combat suffered remarkably low losses compared to first engagements in earlier wars. Well-prepared leaders made the right choices and soldiers performed with confidence grown from their repeated exposure to evaluated training experiences. Realism in training reinforced by professional reflection and shared lessons learned saves lives.

The military forces of the early twenty-first century face complex missions and diverse challenges,

demanding training not just for combat but also for operations short of war, such as peacekeeping, humanitarian aid, counter-terrorism, and nation building. Soldiers must be prepared to shift rapidly from one operational mode to another, often with radically different rules of engagement. Current training practices emphasize this adaptability. Self-discipline and initiative, a shared understanding of the mission and the commander's vision, skillful application of technology, battlefield mobility and firepower, and a belief in both individual uniqueness and in skilled teams remain, as in Steuben's day, the foundations of organizational effectiveness. Military service is a calling and a vocation, linked throughout America's history by a remarkable faith in professional education and training.

## MISCONDUCT IN EDUCATION

The definition of education corruption includes both its existence and the perception of its existence. According to Transparency International, for instance, Romania ranks 69 out of 91 countries in terms of corruption perception. Uzbekistan ranks 71 and the Russian Federation ranks 79. The definition of education corruption derives from the more general set of corruption issues. As in other areas, it includes the abuse of authority for material gain. But because education is an important public good, its professional standards include more than just material goods; hence the definition of education corruption includes the abuse of authority for personal as well as material gain.

### **Why Is It Important for a Nation to Be Free of Education Corruption?**

Since the time of Plato, it has generally been understood that a key ingredient in the making of a nation-state is how it chooses its technical, commercial, and political leaders. In general it is agreed that no modern nation can long survive if leaders are chosen on the basis of ascriptive characteristics, that is, the characteristics with which they are born: race, gender, social status. On the other hand it is common for families to try to protect and otherwise advantage their own children and relatives. All parents wish for the success of their own children; every group wishes to see the success of children from their particular group. This is normal.

Schooling provides the mechanism through which these opposing influences can be carefully managed. It is a common instrument employed by nations to “refresh” the sources of its leadership. Economists have tried to estimate the sacrifice in economic growth if there is a serious bias in the selection of leaders. It has been estimated that developing nations could improve their gross national product per capita by 5 percent if they were to base their leadership upon merit rather than on gender or social status. In fact by some estimates, the economic benefit to developing countries of choosing leaders on the basis of merit would be three times more than the benefit accruing from a reduction in Organisation for Economic Co-operation and Development (OECD) trade restrictions on imports.

Success in one’s schooling is one of the few background characteristics seen as necessary for modern leadership. Although it is possible for lead-

ers to emerge through experience or just good fortune, getting ahead in schooling is seen as essential.

But what if schooling itself is not fair? What if the public comes to believe that the provision of schooling favors one social group? What if the public does not trust the teachers to judge student performance? What would happen if the process of schooling had been corrupted?

The fact is that in a democracy, the public takes a very active interest in the fairness of its education system. If the public does not trust the education system to be fair or effective, more may be sacrificed than economic growth. It might be said that current leaders, whether in commerce, science, or politics, had acquired their positions through privilege rather than achievement. If the school system cannot be trusted, it may detract from a nation’s sense of social cohesion, the principal ingredient of all successful modern societies.

### **The Characteristics of an Education System Free of Corruption**

A school system that is free of corruption is characterized by the following:

- Equality of access to educational opportunity
- Fairness in the distribution of educational curricula and materials
- Fairness and transparency in the criteria for selection to higher and more specialized training
- Fairness in accreditation in which all institutions are judged by professional standards equally applied and open to public scrutiny
- Fairness in the acquisition of educational goods and services
- Maintenance of professional standards of conduct by those who administer education institutions and who teach in them, whether public or private

### **Categories of Educational Corruption**

Some refer to corruption as though it were a unitary concept or a problem with a single dimension. It is more complex than many realize. So frequent is corruption in education that it cannot be well understood without first differentiating one type from another.

**Corruption in selection.** There is no nation in which the proportion of the age cohort attending at the end of the system is as large as it is at the begin-

ning. Educational opportunity is shaped not like a rectangle, but like a pyramid. If one defines *elite* as meaning only those who are able to enter, then all nations have education systems that have elite characteristics. Therefore, the question is not whether a system selects a few to proceed, because all nations must select. Rather, the question is how that selection is made.

Educators sometimes argue that certain kinds of selection tests and techniques are “better” than others. For instance, some might argue that essay questions or oral examinations are better than multiple-choice questions. This kind of discussion, when divorced from context, is spurious.

Three principles help determine the choice of appropriate selection techniques: (1) available resources, (2) logistical challenges, and (3) the level of public accountability. Maintaining the same standard of reliability, cost differences in grading an essay versus a multiple-choice question can be as much as 10:1. Moreover, as test-taking populations expand, the differences in costs expand as well. The cost difference between grading an oral and a multiple-choice exam may be 10:1 if the number of test takers is 1,000. But if the number of test takers is 1 million, the cost difference may be 100:1.

The appropriate system in Sweden might be to have each teacher individually design and grade selection examinations. But with about 1 percent of Sweden’s education resources, about 100 times the number of university applicants, and an extensive geographical challenge, the appropriate system in China must be more standardized and machine gradable.

A key difference among nations is not the kind of test used, but whether whatever technique is chosen can be corrupted. How selection is managed is deeply important for maintaining the equality of education opportunity. Since World War II the technology of administering examinations has changed radically in OECD countries, but in many parts of the former Soviet Union and other parts of the world, the technologies have not kept pace. Often, each faculty within each higher education institution administers examinations independently. Many examinations are delivered orally. And many can be taken only at the university where they are designed. This system of selection is unfair, inefficient, and low quality. It is *unfair* because examinations have to be taken where they are designed, meaning that those

who cannot easily travel have less opportunity. The effect of this is to limit access to higher education to students who can afford to travel. It is *inefficient* because students must take a new examination for each institution to which they apply, and given that they cannot do this at a single sitting, they must wait for a new test-taking occasion. This may delay their entry by a year or more. It is of *low quality* because questions are designed by faculty who are isolated from modern labor markets. They use skills that are out of date, and they design tests whose administration cannot be standardized. But the key issue is corruption.

Tests that are centrally scored can still be corrupted by leaks. In some parts of South Asia, questions are privately sold to high-paying candidates before the test is administered. Being more subjective and administered in private, oral examinations are even more open to corruption. As faculty salaries decline in value, and higher education institutions require alternative sources of income, bribery surrounding the admissions process can become a matter of routine. Candidates may even know how much a “pass” will cost and be expected to bring the cash ahead of time. This may be the case, for instance, in the Russian Federation.

**Consequences of a corrupt selection system.** The process of academic selection is the linchpin of any education system and of overall national cohesion. It represents the essence of the public good. If the system is corrupt or widely believed to be corrupt, little else in the education system can be successful. Inattention to corruption in selection places all other aspects of a nation’s economic and social ambitions at risk.

**How to avoid corruption in selection.** Designing selection examinations is technically complex. It requires a high degree of professionalism, modern equipment, and staff with scarce technical skills who are able to garner high salaries in the private sector. Unless they are in very wealthy countries, few government ministries are able to perform selection functions well. The alternative is to create an autonomous agency, staffed with internationally recognized experts and guided by public education standards and policies, but financed by modest examination fees.

**Corruption in accreditation.** The way in which institutions of higher education are publicly “recognized” is through a system of accreditation. When

all institutions were state owned and administered, the system was managed within the central ministries. In the 1990s two things happened that corrupted many systems of accreditation. First, because of the openness to new economic systems and new labor markets, higher education institutions responded with the introduction of a number of new degree programs. All of them need to be recognized. Second, the number of private institutions blossomed, with many of these claiming to be as high in quality as the older, more established public institutions.

Both of these tendencies are positive and should be encouraged. The problem is not that there is private education. The problem is that the system of accreditation has not sufficiently changed in response to the new programs and institutions. In many instances accreditation committees remain in the hands of rectors of public institutions who may have an interest in preventing competition.

The higher education system of accreditation is often corrupt because the connection between higher education and the system of “licensing” or “certifying” professionals has not been reformed. (A license allows a person to practice a given profession, such as medicine; certification allows a person to practice a specific specialization, such as surgery.) Whenever higher education institutions are associated with licensure and/or certification, the stakes for accreditation are high. The price for accreditation on the corrupted market is therefore high as well.

Institutions that seek recognition of new programs, or private institutions that seek institutional recognition, often have to pay a bribe. This places the nation at risk because an institution of low quality may be licensing individuals who may not be of sufficient professional standard. There are many instances of corrupted accreditation leading to poor medical schools, law schools, and programs of business and accounting. On the other hand, the correct response should not be to confine a nation to only old programs and traditional institutions. All nations need innovation in higher education in response to social and labor market challenges.

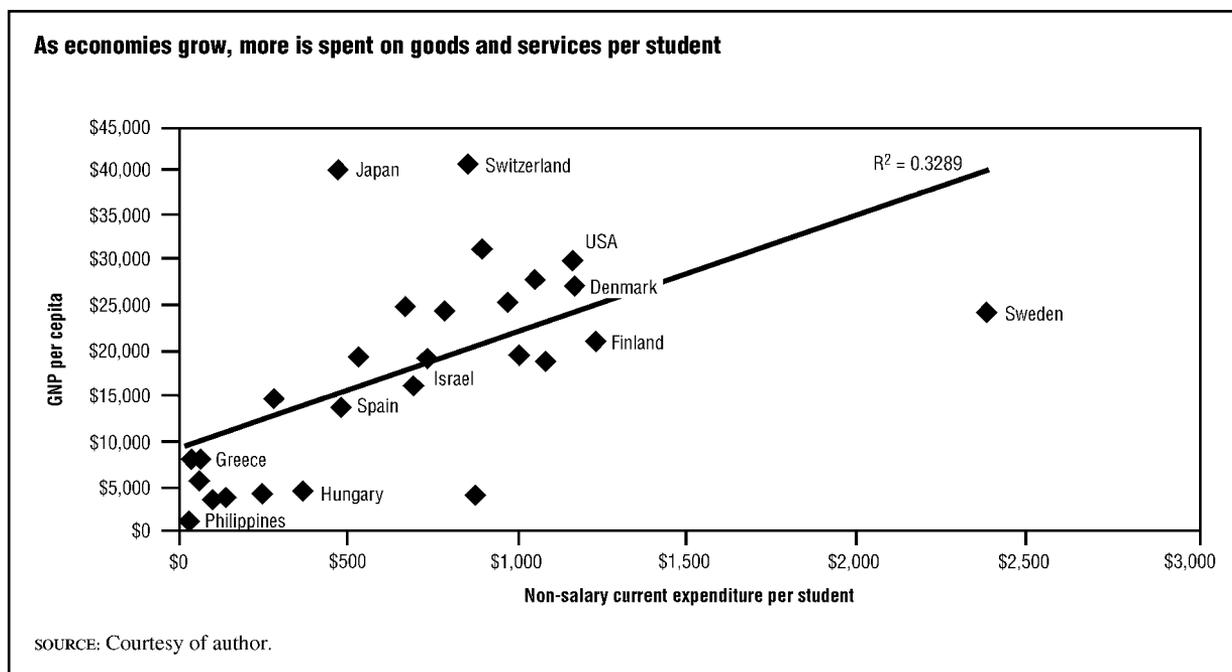

***How to avoid corruption in accreditation.*** How can a nation encourage educational innovation and, at the same time, protect itself from poor quality higher education programs? The answer is twofold. First, the process of accreditation must be liberalized. It should be simple and inexpensive for a new

program and for new institutions to operate. Control over quality should not be made at the stage of accreditation. In nations that have a wide variety among accredited institutions, the function of accrediting changes. Instead of creating institutions of identical quality, it creates institutions with identical transparency in public accounting of their purposes, staffing, and results. The public is then free to choose a wide range of educational quality at different prices.

Second, the process by which individuals leave higher education and apply to practice or be certified in their professions should be separated from the higher education institutions themselves. No matter how excellent, no university should provide a license to practice medicine. In many parts of the world, such as the United States, where significant portions of higher education is in private hands, the process of licensing and certification is separate from universities. A law degree from the University of Chicago or Yale will not permit someone to practice law. For that they, and all others, must sit for the external examination. It is the law examination that weeds out potentially low quality lawyers, not the law schools. This lowers the risk of bribery in the process of accreditation. The license to practice medicine should be governed by a board of medical examiners that manages a system of testing to which all medical applicants must pass. Similar systems must be established for law, accounting, and other fields. Key to this new system is to allow many new higher education institutions to compete with one another. This will allow both low- and high-quality institutions to operate freely and at different prices. Having a variety of quality allows some low-quality institutions to attract new students, to innovate, and to improve. Open competition may allow some institutions of high quality to slip in status and competitiveness. At the same time as this variation in quality occurs, the public is protected from malpractice by the rigor of the licensing and certification examinations. And because accreditation is no longer associated with a license to practice, the process of accreditation can be more liberal. Furthermore, having a more open system of accreditation takes the pressure off it. The effect of this will be to eliminate graft and corruption in the process of accreditation.

***Corruption in supplies.*** It is rarely recognized that, in fact, education is a big “business.” In North America, the education and training sector accounts for 10 percent of gross domestic product. Education

FIGURE 1

and training is the economy's largest sector after health care, and the fastest in growth. In considering only compulsory education for a moment, expenditures can be divided first into capital and recurrent categories, then into salary and nonsalary categories. In terms of nonsalary expenditures there is wide variation from one country to another, with Sweden spending about U.S. \$2,394 per pupil and India spending less than U.S. \$1.00 per pupil. Nevertheless, as countries develop economically, more resources are allocated to support educational quality (see Figure 1).

This process of development raises the size of the education markets around the world, particularly in countries with healthy rates of economic growth. Across the world, public education expenditures doubled between 1980 and 1994. In North America they grew by 103 percent; in Western Europe by 135 percent. But in East Asia and the Pacific, they grew by more than 200 percent during the same period (see Table 1).

First it might be noted that corruption in school supplies can be found in countries at all levels of economic development, from Kenya and Uganda to the United States and other more well-endowed nations. To understand the problem of corruption in educational supplies, one must divide the supply process into three distinct parts: (1) design (such as with

pedagogical materials and textbooks), (2) manufacturing (printing), and (3) distribution. The source of problem may be different with each category.

The corruption of the design process usually occurs when a public agency, such as a ministry of education, contracts for designs (such as the writing of textbooks) among a short list of privileged authors or providers. Sometimes these authors or companies provide educational officials with a gift or bribe for the privilege of designing educational materials. If an author receives a proportion of the sales, the level of illegal earnings can be significant. In terms of book sales in North America, for instance, two-thirds of publishing profits come from educational publishing. Hence, the receipt of contracts for textbook design can bring an automatic benefit to the authors.

In the manufacturing process, the hazard of corruption is similar. Benefits will accrue to the firms that are given contracts for printing or making the materials, and because of the guaranteed nature of educational sales, the profits are often high.

Most corruption in school supplies stems from the use of "protection." Protection is a well-known notion in other fields, such as the manufacturing of automobiles, furniture, glass, and steel. If a country sets up trade barriers targeting imports, these barriers have an economic cost. Governments may be-

lieve that the costs are worth it and that protection is justified on the basis of five common arguments:

- National interest, image, and pride. To appear strong, some believe it necessary to “protect oneself” from foreign products. This argument is very common in education. All nations believe they have the right to educate their citizens in the way they choose. What may not be well understood is that to do this well, curriculum, supplies, and materials need not be a public sector monopoly.
- Safeguard of local jobs. This is rarely made in education by comparison, say, to textiles, but it can be used when other arguments appear weak.
- Grace period for “infant industries.” This refers to the argument that a new business is likely to be more vulnerable to competition than a more mature business. Sometimes those responsible for a new business may argue for tariff protection against foreign competition on grounds that they are inexperienced and that the protection is needed for a “short period of time,” until they are more prepared for the competition. This interim period is known as the grace period and the new industry is referred to as an “infant industry.” This is commonly heard with respect to local textbook publishers and providers of tests and standardized examinations.
- Saving foreign exchange. This is an argument typical of very low-income countries with artificial restrictions on foreign exchange. The prob-

lem with this argument is that the cost in local exchange may be considerably higher than an imported product.

- Unavailable supply from nongovernment sources. In education this is the most common argument heard, particularly with respect to textbooks. This argument is common in countries where the language of instruction is local. It is argued that because no local suppliers exist, the government must therefore manufacture the nation’s textbooks. The argument rests on the assumption that the “supply response” would be near zero if open competitive bidding were allowed—that, in essence, there would be market failure. In many instances this assumption rests on the experience of there being no fair or open competition in the past. It also must be remembered that, given market principles, international suppliers—such as Oxford University Press, Microsoft, and World Book Encyclopedia—are usually quite happy to produce the products in whatever language is required and are also quite prepared to lease copyrighted materials to local publishers and manufacturers.

**How to avoid corruption in supplies.** Corruption risk can be minimized by following three distinct steps. First is to treat the educational procurement process in the same way as the procurement of all other goods and services. Educational supplies should not be singled out as distinct in any way. This first step will bring the procurement

process in education in line with the procurement process in other areas, such as pharmaceuticals for the health care system, office supplies, and vehicles. Second is to establish bidding procedures in which there are no hidden “wires.” Specifications should not be written that would in any way benefit a single group of manufacturers. Third is to open up the bidding process in parallel with the new guidelines on education services circulated by the World Trade Organization.

Strong resistance to open and competitive bidding often emerges from the education community. It might be noted that protection in educational manufacturing—whether software or computer hardware, furniture, textbooks, or even testing items—has the same cost as protection of any industrial product. It raises the real price, it constrains the quality, and it lowers the effectiveness. Most industrialized nations have come to realize that the natural public responsibility for education is to establish the curriculum principles and objectives of education. It is then a public responsibility to establish professional specification for the delivery of products and services to meet important national goals. The rest should be in the hands of private entities, competing against one another. The more limited the role of the government in the manufacturing process, the lower the chance for corruption in the process of educational supply.

**Professional misconduct.** Because education is a public good, education corruption must include an element broader than illicit material gain for personal use; it must include an element of professional misconduct. Misconduct can be found in other professions—the law, architecture, accounting, engineering, and so on. But when misconduct affects children and youth—citizens who are not adults or who are young adults—the implications are more serious and the safeguards must be more stringent.

Elements of professional misconduct in education include:

- Accepting material gifts or rewards in exchange for positive grades or assessments or for selection to specialized programs
- Assigning grades or assessments that are biased by a student’s race, culture, social class, ethnicity, or other ascriptive attributes
- Insisting on a student’s adoption of the instructor’s personal values and philosophy
- Disclosing confidential information regarding a student

- Exploiting, harassing, or discriminating against particular students
- Adopting an inadequate textbook or inferior educational materials because of a manufacturer’s gifts or incentives
- Forcing students to purchase materials that are copyrighted by the instructor
- Ignoring the inadequate teaching of colleagues, the unequal treatment of students, or the misconduct of fellow professionals
- Using school property for private commercial purposes

Definitions of faculty misconduct may differ from one country to another. For example, if a faculty member were to assign reading only from his own book, this would be interpreted as misconduct in higher education institutions in the United States but not in all parts of the world. Nevertheless, no nation can long ignore the existence of significant misconduct. In some countries it is common for teachers to accept payment for allowing students to proceed to the next grade. In some countries it is common for teachers to offer after-school tutoring for a price and to suggest that students might fail if they do not pay for after-school tutoring. In some countries, faculty may operate a “private” school in the after-school hours, hence using public property for private gain. In other instances, a school administrator or university rector may rent school property or use it for manufacturing or agricultural commerce and not report the income.

In some instances, the misconduct constitutes a criminal offense. Theft or misuse of public property for personal gain is a crime. With the installation of new tuition and fees, it is common for them to be used for private profit rather than for the benefit of the school or university. In these instances, misconduct needs to be judged by the criminal court system. In other instances, such as a teacher’s bias against a certain category of student, the misconduct may be limited to professional ethics. In these cases, strong professional boards with the authority to fine and dismiss should be encouraged. The public needs to feel protected from faculty misconduct, and the effectiveness of the professional review boards may be an essential ingredient in their protection.

**Corruption in educational property and taxes.** Educational facilities often occupy prime locations in urban areas. These can be rented or leased for both educational and other purposes. Almost all higher

education institutions, and also many institutions in compulsory education, must supplement public with other resources. But how should educational property be considered: as a private or public income? And how should alternative sources of income be taxed, or should they be taxed at all? And if there is reason not to tax educational institutions, or to tax them at a different rate than commercial businesses, should one treat all educational institutions the same? Should income to public education institutions from nontraditional sources be taxed the same as nontraditional income in private educational institutions? Should equity-owned private educational institutions (which share profits among the owners) be treated the same as a nonprofit institution, which reinvests all profits back into the institution?

One reason why corruption is so common in education is because the answers to these questions have never been adequately sorted out. From the time that government ministries “owned” all property in the Soviet Union to the present, it has never been quite clear which portion of government had ownership of educational property. Take the illustration of a local vocational school: Would it be owned by the enterprise on whose land it might sit? By the local municipality? By the region? By the national sector ministry? Take a technical university, previously under the ministry of industry: Does the land still belong to that ministry? Does land at all higher education institutions now belong to the ministry of education? Does it belong to the local municipality? Does it belong to the rectors council? Or would different authorities “own” different elements? Would the state-owned enterprise own the equipment, the ministry of education own the building, and the local municipality own the land?

#### ***How to avoid corruption in property and taxes.***

In the area of educational property and taxes, the single most important factor in reducing the risk of corruption is to clarify the situation of the land and the tax obligations. Recommendations include the following:

- Higher education land should belong to the board of trust of the higher education institutions themselves. This board of trust may be government appointed and would guide the long-term institutional interests.
- Profit-making educational institutions that are equity-owned should pay the same taxes as all commercial businesses.

- As long as they are not commercial (i.e., equity owned), neither public nor private educational institutions should pay tax on income.
- Information about gifts from individuals and from corporations should be made public, and such tax should be tax deductible.

#### **What Can Be Done about Educational Corruption?**

In some respect, solving the problem of educational corruption is not significantly different from solving the problem of corruption in other sectors. Such behaviors as misappropriation of public property or bribery in conjunction with public procurement—whether in education, housing, or some other area—are governed by similar rules and regulations. If the rules and regulations fail to deter the corruption in these other sectors, they will be similarly ineffective in education.

On the other hand, there are certain preventive measures specific to education corruption. These fall into four categories: (1) structural reforms necessary to reduce the opportunity for corruption, (2) improvements in adjudication and management to help anticipate questions of definition and interpretation, (3) measures necessary to actually prevent corruption practice, and (4) sanctions required to demote or punish when infractions do occur (see Table 2).

#### **Summary**

It has not been common to focus attention on corruption in education. There were many other pressing problems in business, banking, the judicial and legal system, manufacturing, and agriculture. In the early twenty-first century, however, such a focus may be necessary. Collapsing public expenditures have driven all institutions to generate their own resources, for which there is no precedent, and no regulatory structure is in place to give them guidance. One thing is abundantly clear: Whenever rules and regulations are confusing, one must expect a high level of corruption.

The burgeoning profit-making and not-for-profit enterprises within private education, and the entrance of public institutions into private education, have blurred the lines between what is public and what is private. Few within the public may understand what is in the private interest and should be taxed, or what is in the public interest and should

not be taxed. Confusion reigns over issues of educational property. Who actually owns these institutions? And without clear ownership of its land, no higher education institution can successfully approach the private capital markets for a development loan. In essence, no higher education institution can invest in its future until the principles of land ownership are sorted out.

Because of the lack of modern methods and technologies, the systems for selecting entrants into higher education are riddled with bribery. Because the structures are outdated, corruption is common in the accreditation process, the licensing process, and the certification process. Textbooks and supplies often remain under monopolies of the state; foreign suppliers are often prohibited from participating in the bidding process; and designers are chosen on the basis of unprofessional specification and through personal connections. Because of these corruptions and distortions, the education received by young people suffers in quality and in efficiency.

Lastly, because of the inadequate instruments of management and sanctions, professional misconduct is common. It is common for teachers to misuse their professional positions, to accept favors for normal services, and to accept bribes for looking

with favor on certain students. And it is common for tuition and fees to be used for private profit.

These practices would be serious no matter what sector they occurred in. But the fact that they occur with frequency in education poses a particular problem. This is because education is the linchpin of a nation's social cohesion, and once the public comes to believe that the education system is corrupt, they will also believe that the future of their nation has been unfairly determined against them and their interests. If this occurs, a nation will not be able to establish a partnership with other democracies.

**MISSISSIPPI FREEDOM SCHOOLS**

The Mississippi freedom schools were an important project of the Student Nonviolent Coordinating Committee (SNCC) designed to promote freedom, self-determination, and participatory activism aimed at African-American youth in the improvement of local communities and state organizations.

**Project Planning**

In November 1963 the Council of Federated Organizations (COFO) and the SNCC conceived a major civil rights incursion into Mississippi during the summer of 1964. This incursion, spearheaded largely by SNCC and officially known as the Mississippi Summer Project, would promote African-American equality and basic democratic rights through a number of social action projects. One of those projects was the creation of a summer school program aimed at high school–age African-American students, providing them with a richer school experience than they were able to have in their own schools and, it was hoped, committing these students to become a force for social change in Mississippi. This educational endeavor became known as the Mississippi freedom schools.

Charles Cobb, field secretary for SNCC, proposed the idea of freedom schools as a war against academic poverty. He claimed the Mississippi school system and the African-American schools were meant to “squash intellectual curiosity.” Cobb wanted young African-American students to have an education related directly to the everyday experiences and problems of these students. Freedom schools would “offer young black Mississippians an education that public schools would not supply, one that both provided intellectual stimulation and linked learning to participation in the movement to transform the South’s segregated society” (Chilcoat and Ligon 1994, p. 132).

**Implementation**

To effect the idea of freedom schools, a curriculum conference was held in New York in March 1964.

Approximately fifty people with varied backgrounds in education and civil rights work attended the conference. The major focus of the conference and the core of the freedom school curriculum was the formulating of a civic curriculum. The civic curriculum was to be composed of: (1) fourteen problem-solving case studies dealing with the political, economic, and social forces relating to the direct experiences of the students; (2) a *Citizenship Curriculum* facilitating student discussion as a means of achieving a new society; (3) a *Guide to Negro History* providing a comprehensive survey of African-American history; and (4) an emphasis on teachers extrapolating directly from students those personal experiences in which they lived each day in a hostile, repressive, dominantly white society. Also because of the lack of other academic opportunities offered to African-American students in their public schools, the conference included in the freedom schools a reading and writing remediation curriculum, a humanities curriculum emphasizing English, foreign languages, art, and creative writing, and a general science and mathematics curriculum. Coupled with the curriculum, the conference recommended a variety of progressive democratic teaching techniques emphasizing self-discovery and self-expression that were to stimulate the act of questioning.

In June 1964 two one-week orientation meetings were held on the campus of Western College for Women at Oxford, Ohio, for most of the freedom school summer volunteers. The second-week orientation involved the freedom school teachers. The orientation workshops were training courses in pedagogical techniques and in the use of the core civic curriculum developed at the curriculum conference. Upon completing the orientation, the volunteers traveled to their freedom school locations in Mississippi to begin their six-week stay. The original expectation was the creation of twenty schools with a desired student population of 1,000. However, freedom schools became a far greater success than the project had planned, with forty-one schools in twenty communities and 2,165 students.

As the Summer Project ended, it was hoped that freedom schools would continue. Although some of the schools did continue to operate, few could sustain either learning or activism. The schools were never projected as permanent institutions but rather, according to most of the original planners, as a tactic for immediate change. However, for many students and teachers, the freedom schools in those

short six weeks had a substantial impact on their lives.

The Freedom Schools showed that there can be a situation where learning is not forced upon youth. This was a type of education which gave individuals a personal interest in social relationships, a personal interest that made learning something to be sought after. . . . The Freedom Schools met the challenge of changing the social order through the educative process. They showed that this is not an additional burden that must be met through education, but a necessity if we are to have truth, justice, and equality in society. (Chilcoat and Ligon 1995, p. 6)

## MNEMONIC STRATEGIES AND TECHNIQUES

Mnemonic ("nee-moh-nick") techniques, also referred to as mnemonic strategies, mnemonic de-

vices, or simply mnemonics, are systematic procedures designed to improve one's memory. The word *mnemonic* derives from the Greek goddess of memory, Mnemosyne, and means "memory enhancing." The most comprehensive treatise on the historical development of mnemonic techniques may be found in Robert Alan Hrees's 1986 doctoral dissertation, in which it is noted that in preliterate cultures "history is preserved orally and the poets, like Homer, tell that history in their rich poetry, 'recited by heart.' [The ancient] Greeks prefaced such performances with a call to Mnemosyne, requesting her aid for a flowing and accurate recitation" (p. 1).

Since the mid-1970s, mnemonic techniques have been the subject of extensive research attention by psychological scientists. This attention has been directed at both analyzing the presumed components of mnemonic techniques and evaluating their effectiveness in numerous applied and academic contexts. As will be seen, mnemonic techniques come in different varieties and combinations. Moreover, the "accurate recitation" goal of the ancient Greeks notwithstanding, mnemonic techniques have been shown to serve a wide range of memory-related functions.

### Components of Mnemonic Techniques

Mnemonic techniques work because they provide meaningful connections between informational items that are typically novel or unfamiliar and, therefore, are difficult to remember. Suppose, for example, that an eleventh-grade student has just encountered the word *philatelist* for the first time and wants to remember the textbook definition that accompanies it ("a person who collects stamps"). Applying Joel Levin's (1983) "three R's" of associative mnemonic techniques—recoding, relating, and retrieving—the student would first engage in recoding the unfamiliar word *philatelist* into a familiar proxy, or "keyword"—a salient part of the unfamiliar word's sound or spelling that, ideally, is picturable. Thus, for *philatelist*, a reasonable keyword might be *Philistine* (represented by, say, the Biblical giant, Goliath), *Philadelphia*, *pilot*, *plate*, or *flat*. For present purposes, *Philistine* will be used.

The second "R" component of the mnemonic process involves relating the keyword to the to-be-remembered definition in the context of some integrated scene or episode. Here, for example, the student might imagine Goliath, the Philistine, being smitten by an object from little David's sling. In this

constructed scene, however, the object is not a stone, but rather a colorful postage stamp that has been left (“collected”?) on Goliath’s forehead.

Thus, with the unfamiliar word effectively recoded and related, the third “R” represents the systematic path that has been constructed for retrieving the definition from memory when the unfamiliar word is re-encountered. Here, when the student attempts to remember the meaning of the word *philatelist*, the keyword *Philistine* should come to mind, which in turn should re- evoke the picture of Goliath with the colorful postage stamp collected on his forehead, which in turn should elicit the “person who collects stamps” definition.

**Comments on the mnemonic process.** Four related comments are in order. First, authors of many popular books in which mnemonic techniques are promoted assert that the focal information in the integrated scene (i.e., the keyword related to the associated information) needs to be greatly exaggerated or be in some way “bizarre.” Yet, scientific research on mnemonic techniques has indicated that such an assertion is without empirical foundation. Rather than exaggeration or bizarreness, what seem to be critical for mnemonic techniques to work are: (1) the effort and attention devoted by the learner to the task at hand, namely the selection/use of an effective keyword; and (2) the formation of a vivid (clear) image of the integrated keyword-information scene. Thus, for the *philatelist* example, a bizarre or exaggerated postage stamp is not a necessity, but selecting an effective keyword cue (one that resembles a salient part of *philatelist*, such as *Philistine*) and creating a vivid image of Goliath with a postage stamp on his forehead are likely to be.

Second, and also based on considerable scientific research, mnemonic techniques work whether their two principal ingredients (recoded keywords and relating scenes) are produced either *by* or *for* a learner. For individuals with adequate cognitive skills (e.g., older students and adults) and with to-be-learned information that is relatively straightforward to identify, recode, and relate, creating one’s own keywords and integrated scenes can be expected to yield memory benefits. On the other hand, for less cognitively capable individuals (e.g., young children or handicapped learners) and with less straightforward to-be-learned information, providing already-constructed keywords and integrated scenes is typically more effective.

Third, such keywords and scenes can be represented either pictorially (in the form of actual illustrations or visual images) or verbally (in the form of sentences or phrases, such as “Somehow, the forehead of Goliath the Philistine had collected a colorful postage stamp on it.”). Fourth and finally, through the introduction of conventional concrete symbols, mnemonic techniques are easily adapted to associating “abstract” (not easily pictured) items. For example, “justice” can be pictorially represented by the scales of justice, “democracy” by a voting booth, “technology” by an electronic computer, “wealth” by a stack of dollar bills, and so on.

### Varieties and Uses of Mnemonic Techniques

The keyword method (which goes under many other names by writers of popular memory-improvement books) is designed to strengthen associations between two or more items. Such items frequently consist of one or more pieces of information that a learner has not previously integrated as a unit (e.g., the definitions of unfamiliar words, the contributions of various famous people, the natural habitats of unfamiliar animals, the capitals of the fifty U.S. states). In each of these cases, less familiar, less meaningful terms (vocabulary words and the names of famous people, animals, or capitals/states) are recoded into something more familiar and picturable (i.e., keywords) and then related to the to-be-associated information (for vocabulary words, to their definitions; for famous people, to their associated contributions; for animals, to their associated habitats; for state and capital names, to each other). It should be noted that the state-capital example is actually a dual-keyword variation of the original keyword method, in that both of the to-be-associated items are recoded as picturable keywords (e.g., *Kansas* as *cans* and its capital, *Topeka*, as a *top*) and then related to one another in an integrated scene (e.g., a spinning top knocking over a bunch of tin cans).

**Verbal-pictorial associations.** In each of the examples in the previous paragraph, the initial form of the two pieces of information to be associated is verbal in nature (i.e., verbal terms and associated verbal information). A variation of the keyword method, for which an item that is pictorial in nature (e.g., a person’s face, an animal’s appearance, an artist’s painting) is to be associated with verbal information (e.g., an unfamiliar name), is known as the face-name mnemonic technique. With this method, the “key-

worded” unfamiliar name is related to a prominent feature of the physical or pictorial representation. For example, when being introduced to a new person with the unfamiliar surname *Lectka*, one could recode the name as the more familiar word *lecture*. Carefully examining the appearance of the person, one might notice the mouth as a prominent characteristic. Then, focusing on that mouth, one could imagine the person delivering a highly technical lecture. When subsequently encountering the person (either at the same gathering or in the future), and with one’s attention drawn to the prominent mouth, it is hoped that the lecture emanating from it would come to mind, which in turn would be helpful in retrieving the surname *Lectka*.

**Ordered associations.** In contrast to the function of the keyword method and its variations (namely, associating unfamiliar, or arbitrary, paired items), the major function of the earliest mnemonic techniques—as applied by Mnemosyne’s protégés—was to remember a list or group of numerically or chronologically ordered information (i.e., to associate each item of a list with a specific number, or to remember the items in a specific order). Chief among such mnemonic techniques was the method of loci, through which ordered items in a list (including the order of topics or points to be covered in a lengthy oration) were associated with a familiar sequence of objects, such as specific landmarks along a well-traveled route—or as has been developed in recent research investigations, familiar holidays to symbolize the numerically coded calendar months.

Two other common mnemonic techniques for remembering ordered information are the first-letter mnemonic and the link method (also known as the chain or story method). With the first-letter mnemonic, the first letter of each to-be-remembered list item is successively linked, either as an acronym (e.g., HOMES to represent the five Great Lakes: Huron, Ontario, Michigan, Erie, and Superior) or as a constructed phrase or sentence consisting of words beginning with those letters, to cue the list items themselves. For example, to remember the increasing distances of the first five planets from the sun (Mercury, Venus, Earth, Mars, Jupiter) using the first-letter mnemonic, one could focus on the letter sequence MVEMJ and construct a little “story” such as: “Murray’s Very Elderly Mother Jumped.” (Murray was intentionally selected here to resemble Mercury in order to help distinguish it from another planet starting with the same letter, Mars.) With the

link method, an association is connected between each successive item in a to-be-remembered list through a sequentially constructed “house that Jack built”-type story or imagined episode. Associated links (e.g., between successive planet names) can be similarly constructed through the introduction of rhyme and meter.

Two mnemonic techniques that are suitable for remembering either ordered or numerically identified information are the pegword method and the digit-symbol method (also known as the digit-consonant method). With the simpler-to-master pegword method, the numbers from 1 to 10 (or 1 to 20) are recoded as familiar rhyming pegwords (for example, 1 = *bun*, 2 = *shoe*, 3 = *tree*, 4 = *door*, 5 = *hive*, etc.). Then, each numbered item in a list is related to the pegword in an integrated scene. For example, if the fifth item in a 20-item list had something to do with sailboats, then one could construct a scene in which bees from a *hive* (for 5) were swarming all over the skipper of a *sailboat*. To later remember the fifth item of the list, one systematically retrieves *sailboat* from the *hive* pegword for 5. To reconstruct the complete list or to order the items in the list, one would need to retrieve the information associated with each of the 20 ordered pegwords.

With the more-complex-to-master digit-symbol method, each digit from 1 through 9 (plus 0) is first recoded as a previously established consonant sound (for example, in one standard system, 1 becomes a *t* or *d* sound, 2 an *n* sound, 3 an *m* sound, 4 an *r* sound, 5 an *l* sound, . . . , 0 an *s* or *z* sound). Either single recoded letters (for up to 10 items) or combined recoded letters (for more than 10 items) are additionally recoded as words that include just those consonant sounds (vowels and silent consonants are ignored in this system). For example, the number 5, recoded as an *l* sound, would additionally be recoded as the words *lie*, *lye*, *oil*, *aisle*, and so on. In contrast, the number 15, recoded as a *t* or *d* sound plus an *l* sound, would additionally be recoded as the words *tail*, *tile*, *doll*, *dial*, *deli*, and so on. Returning to the sailboat example: If *sailboat* were the fifth item in a list, it would be associated with a recoded 5, such as *oil*, and then related to *sailboat* as, say, an imagined scene in which the skipper is oiling the sailboat’s steering mechanism. On the other hand, if *sailboat* were the fifteenth item in a list, it would be associated with a recoded 15, such as *tile*, and related to *sailboat* as, say, an imagined scene in which the

skipper is covering the main deck of his sailboat with tile. The digit-symbol method is also commonly applied to remembering numbers per se, as, for example, telephone numbers, zip codes, and institution-assigned security numbers. For example, to remember a bank-assigned ATM machine personal identification number of 5131, one could apply the digit-symbol method as follows:  $l(5) + d(1) + m(3) + d(1) = \textit{old maid}$ . When approaching the ATM machine, one would simply think of the process as starting to play the card game called Old Maid.

### Educational Applications of Mnemonic Techniques

Joel R. Levin, in his contribution to the 1996 book *The Enlightened Educator: Research Adventures in the Schools*, documented numerous successful educational applications of mnemonic techniques, based on both individual and combined adaptations. Such mnemonic adaptations, several of which have been alluded to throughout this discussion, have been shown to improve students' memory for such educational content as: the meanings of unfamiliar vocabulary words (including foreign-language vocabulary); mathematics facts, concepts, and operations; the states and their capitals; the U.S. presidents; artists and their paintings; people and dates associated with various inventions; and scientific facts, relationships, and processes. In addition, mnemonic techniques have helped students organize and remember both narrative and expository information presented in text passages, with benefits observed on both tests of simple factual recall and those requiring higher-order thinking (e.g., essay production, inferential thinking, and problem solving). From an educational standpoint, mnemonic techniques may not be ideally suited for *all* students in *all* instructional contexts. Such techniques nonetheless provide widespread versatility in their potential for enabling students to grasp basic information efficiently and confidently, thereby freeing them to move on to more cognitively demanding tasks. Continuing mnemonic research is helping teachers and students realize the limits of that educational potential.

## MODERN LANGUAGE ASSOCIATION OF AMERICA

Founded in 1883, the Modern Language Association (MLA) of America is the largest society of humanists in the United States. Its mission is to promote study, criticism, and research in the modern languages and their literatures and to further the common interests of teachers of these subjects.

### Programs and Publications

The MLA's programs are designed to serve the scholarly and professional interests of its members.

The association publishes two journals: *PMLA*, a distinguished scholarly journal, appears six times per year; *Profession* is an annual that carries committee reports, association surveys, and articles on a range of professional topics. Established in 1922, the *MLA International Bibliography* provides an annual classified listing and subject index of more than 50,000 books and articles about film, folklore, language, linguistics, and literature that are published worldwide. It is available in print and electronic formats. The reference work began to cover publications about rhetoric and composition and the teaching of language and literature with the 2000 edition. The MLA's book publication program meets the needs of students, teachers, and scholars through several series: *Approaches to Teaching World Literature*, *Texts and Translations*, *Introductions to Older Languages*, *Options for Teaching*, and *Teaching Languages, Literatures, and Cultures*. Well-known to students are the *MLA Handbook for Writers of Research Papers*, *A Research Guide for Undergraduate Students*, and the *Literary Research Guide*. The *Job Information List*, which is available in print and electronic formats, offers up-to-date descriptions of employment opportunities in postsecondary English and foreign language departments.

The MLA convention, which takes place each year from December 27 through 30 and attracts between 8,000 and 9,000 participants, gives members opportunities for scholarly exchange on a wide range of topics. The association is also committed to collecting statistical information about the field. Recent studies examine enrollment trends in foreign languages, the use of part-time faculty members in English and foreign language departments, employment opportunities for new Ph.D.s, and the characteristics of successful college and university foreign language programs.

The MLA houses the Association of Departments of English (ADE) and the Association of Departments of Foreign Languages (ADFL). These organizations arrange summer seminars for chairs of English and foreign language departments, develop standards for the field, and publish the *ADE Bulletin* and *ADFL Bulletin*, which serve departmental administrators.

In 1997 the MLA introduced *What's the Word?*, a 29-minute weekly radio series that was available by 2001 on 125 National Public Radio stations and through Armed Forces Radio. The series showcases scholars in the field. Its purpose is to demonstrate

how the study of languages and literature enriches people's lives. Sample topics include "Literature of the Sea," "Shakespeare Then and Now," "Film Couples," "Post-Apartheid South African Literature," "The Blues as Literature," and "Sermon Traditions."

### Organizational Structure

Seventeen MLA members are elected to serve on the executive council, which has fiduciary responsibility for the association and selects the executive director, approves the annual budget, and appoints committees. A larger elected body, the delegate assembly, meets at the annual convention and considers a range of issues affecting the profession and the association. The assembly recommends actions to the executive council. MLA committees and staff members develop and implement the association's programs.

The MLA is a constituent society of the American Council of Learned Societies and an associate member of the American Council on Education. The MLA maintains membership in two advocacy coalitions—the National Humanities Alliance and the Joint National Committee for Languages. It is also a member of the *Fédération Internationale des Langues et Littératures Modernes*.

### Membership and Financial Support

Membership in the MLA is open to any individual interested in advancing the goals of the association. The association has 30,000 members and supports its programs through publication revenue, library subscriptions, annual dues, and registration fees for the annual meeting. An endowment fund is valued at \$1.1 million.

### History and Development

The MLA was established in 1883 by forty college teachers who wished to encourage the study of the modern languages in U.S. colleges and universities at a time when the role of the classical languages was beginning to decline. Initially, MLA members established a journal for the publication of research in the field and organized an annual meeting to discuss scholarly and pedagogical issues. As the study of the modern languages grew increasingly important in both higher education and the schools, the MLA also grew.

PHYLLIS FRANKLIN

## MODERN RED SCHOOLHOUSE

The Modern Red Schoolhouse (MRSh) is part of a larger effort in the United States to design schools for the twenty-first century—schools where all students can achieve world-class academic standards. In the early 1990s, during its design and pilot phase, MRSh was housed at the Hudson Institute, a public policy research organization in Indianapolis, Indiana. The institute was awarded a competitive five-year contract from the New American Schools Development Corporation to develop the design, pilot it, and provide training and support to schools that chose to adopt it.

The Modern Red Schoolhouse design for twenty-first-century schools evolved around a central premise: All students can master high academic standards, but they vary in the ways that they learn best and in the time that they need to learn. While simple in concept, this premise constitutes a stark contrast to the ways in which public schooling evolved during the twentieth century in the United States—when expectations for learning varied by the presumed ability and interest of a given student, yet the pedagogy and time to learn was the same for all students. The MRSh premise is built from research in sociology and psychology showing that: (a) intelligence is heavily influenced by a learner's effort and opportunity to learn, rather than simply inherited, and (b) instructional methods that make effective links to students' prior experiences and learning are essential to learning.

The MRSh design seeks to structure a school environment that allows students to vary their level of effort to meet academic standards and enables teachers to use a variety of pedagogies and adapt instructional strategies to meet the needs of students. High academic standards are the same for all students. The MRSh design assumes that schools are accountable for student outcomes, but proposes giving schools considerable freedom in selecting strategies to achieve student outcomes in terms of staffing, instructional design, and the use of time. Community

and parent involvement focuses on activities that support student learning—whether it be assisting teachers in establishing links between disciplinary knowledge and concrete problems in industry and communities, or by providing students with additional opportunities to advance their understanding or mastery of standards outside the regular school day.

This design views assessment as an ongoing activity embedded in the instructional process. Remedial courses should not be necessary; rather, extra time or varying approaches are available as needed in any given week. Formal assessments in the original design include *capstone units* that, taken collectively, address all academic standards through interdisciplinary performance assessments. Capstone units are interdisciplinary units that have a cumulating performance assessment intended to allow students to demonstrate mastery of a number of academic standards. As part of a larger assessment system, they provide teachers with data regarding a student's readiness to take one or more subject exams to confirm their mastery. A more traditional set of subject exams, common to all schools, verifies that students have met the necessary level of mastery required of all MRSh students. Extending the services already available to students with special needs, the design expects teachers to work with students and their parents to develop an Individual Education Compact, which is an ongoing plan for student learning that specifies the responsibility of each party (student, parent, and teacher). As students mature, they take increasing responsibility for proposing the compact, constrained only by the standards they are ultimately required to master. Technology is not only used for instructional activities, but is an essential tool for communication within the school community and for management of classroom instruction.

In developing training to support wider adoption of the design among existing schools, MRSh sought to enable schools to complete substantial portions of implementation within a three-year period with twenty to thirty days of technical assistance a year. The structure and content of the assistance assumes that schools are at different starting points along a continuum of implementation—thus the need to customize the time and methods of implementation at each school. Similarly, the MRSh design calls for developing the actual plan of instruction at each school to reflect the state or dis-

trict academic standards and the prior cultural and academic experiences of the students attending the school.

In 1998 federal funding became available that allowed schools with economically disadvantaged students to adopt a Comprehensive School Reform Design, which would enable them to effect substantial improvements in student achievement over a three-year period. In this massive scale-up, MRSh Institute—which had been established as an independent organization in 1997—adapted the original model to serve these schools. In general, the formal assessment system in the original design was replaced by that of the relevant state or district, and the technology acquisition was adapted to meet the various exigencies of urban school districts. The MRSh Institute’s essential contribution to school reform has been to operationalize the notion of a standards-driven school and classroom and, as such, many districts rely upon its services to assist schools in re-framing their work to match district or state standards. From 1993 to 2002 the Modern Red Schoolhouse Institute had served 130 schools in fifty-six districts and provided district-wide services in five metropolitan areas.

SALLY B. KILGORE

## MONTESSORI, MARIA (1870–1952)

Physician Maria Montessori is recognized as one of the pioneers in the development of early childhood education. She is also credited with promoting a substantial number of important educational reforms that have worked their way over the course of the twentieth century into the mainstream of education. These include the recognition of multiple pathways to learning, the importance of concrete or hands-on learning, the stages of cognitive development in children, and the link between children’s emotional development and their ability to learn at

an optimal rate. Her ideas about the importance of the first six years of life and the boundless potential of children—regardless of race, gender, or social class—made a significant contribution to human rights as societies around the world began to redefining the rights and roles of women and children.

### Biography

Montessori was born in 1870 to an educated middle-class family in Ancona, Italy. Growing up in a country that was, at the time, very conservative in its attitude toward and treatment of women, Montessori pursued a medical and scientific education. In 1896, despite many years of opposition from her father, teachers, and male fellow students, she graduated with highest honors from the Medical School of the University of Rome, becoming the first woman physician in Italy.

### Work with Disabled Children

As a physician, Montessori specialized in pediatrics and the newly evolving field of psychiatry. Her approach was that of a well-trained scientist, rather than the familiar philosophical exploration and intuitive approach followed by many of the educational innovators who came before and after. Montessori found it ironic that she became best known for her contributions in education, a field that she had been unwilling to enter as it was one of the three traditional roles open to women at the time: working with children, homemaking, or the convent.

Montessori taught at the medical school of the University of Rome, and through its free clinics she came into frequent contact with the children of the working class and poor. Her experience with the children of poverty convinced Montessori that intelligence is not rare, although it seemed to present itself in many forms other than those recognized by traditional schools.

In 1900 Montessori was appointed director of the new Orthophrenic School attached to the University of Rome, formerly a municipal asylum for the “deficient and insane” children of the city, most of whom would be diagnosed in the twenty-first century as autistic or mentally disabled. She and her colleagues initiated a wave of reform in an institution that formerly had merely confined these mentally challenged youngsters in barren settings. Recognizing her young patients’ need for stimulation, purposeful activity, and self-esteem, Montessori dismissed the caretakers who treated the inmates

with contempt. Facing a desperate lack of staff to care for so many children in a residential setting, she set out to teach as many as possible of the less-disturbed children to care for themselves and their fellow inmates.

### **Links to Itard and Séguin**

From 1900 to 1901, Montessori combed the medical libraries of western Europe seeking successful work previously done with the education of children with disabilities. Her studies led Montessori to the work of two almost forgotten French physicians of the eighteenth and nineteenth centuries: Jean-Marc-Gaspard Itard and Édouard Séguin. Itard is well known in the twenty-first century for his work with the “Wild Boy of Aveyron,” a youth who had been found wandering naked in the forest, presumably abandoned as a very young child and thus spending many years living alone. The boy could not speak and lacked almost all of the skills of everyday life. Here apparently was a “natural” man, a human being who had grown up outside of human society without the influence of interaction with his own kind. Itard hoped from this study to shed some light on the age-old debate about what proportion of human intelligence and personality is hereditary and what proportion stems from learned behavior.

This experiment was a limited success, although it captured the attention and imagination of many of his contemporaries. Itard found his wild boy uncooperative and unwilling or unable to learn most things. This led him to postulate the existence of developmental periods in normal human growth. He formed the hypothesis that, during these “sensitive periods,” a child must experience stimulation to develop normally, or grow up, forever lacking the skills and intellectual concepts not developed at the stage when nature expects them to be readily absorbed.

Although Itard’s efforts to teach the wild boy were barely successful, he followed a methodical approach in designing the process, arguing that all education would benefit from the use of careful observation and experimentation. This idea had tremendous appeal to the scientifically trained Montessori, and later became the cornerstone of her method.

From the work of Édouard Séguin, a French psychologist who studied with Itard and carried on his research, Montessori drew further confirmation of Itard’s ideas, along with a far more specific and

organized system for applying it to the everyday education of children with disabilities. Working primarily with the blind, Séguin developed a methodical approach to breaking skills down into small steps, and was highly successful with a carefully developed collection of hands-on educational materials. In the early twenty-first century, Séguin is recognized as the founder of the modern approach to special education.

### **The Orthophrenic School**

From these two predecessors, Montessori took the idea of a scientific approach to education, based on observation and experimentation. She belongs to the child study school of thought and pursued her work with the careful training and objectivity of the biologist studying the natural behavior of an animal in the forest. Montessori studied her mentally disabled patients, listening and carefully noting their response to her attempts to implement Séguin’s educational methods, as well as their progress in becoming increasingly independent and verbal.

Slowly the children learned to perform most of the everyday tasks involved in preparing the meals and maintaining the environment of the residential school. Her success with these mentally disabled children received international attention when, after two years, many of Montessori’s such adolescents were able to pass the standard exams given by the Italian public schools.

Acclaimed for this miracle, Montessori responded by suggesting that newborn human beings normally enter the world with an intellectual potential that was barely being developed by schools in the early years of the twentieth century. She challenged that if she could attain such results with children who were disabled, schools should be able to get dramatically better results with normal children.

Montessori’s work reinforced her humanistic ideals, and she actively supported various social reform movements. She was a highly regarded guest speaker throughout Europe on behalf of children’s rights, the women’s movement, peace education, and the importance of a league of nations. Montessori became well known and highly regarded throughout Europe, which contributed to the publicity that surrounded her schools.

### **The Children’s House**

Unfortunately, the Italian Ministry of Education did not welcome Montessori’s ideas, and she was denied

access to school-aged children. Frustrated in her efforts to conduct the experiment with public school students, in 1907 she welcomed the opportunity to serve as the medical director for a day-care center that was being organized for working-class children who were too young to attend public school.

This first Casa dei Bambini (Children's House) was located in the worst slum district of Rome, and the conditions Montessori faced were appalling. Her first class consisted of fifty children, from two through five years of age, taught by one untrained caregiver. The children remained at the center from dawn to dusk while their parents worked, and had to be fed two meals per day, bathed regularly, and given a program of medical care. The children themselves were typical of extreme inner-city poverty conditions. They entered the Children's House on the first day crying and pushing, exhibiting generally aggressive and impatient behavior. Montessori, not knowing whether her experiment would work under such conditions, began by teaching the older children how to help out with the everyday tasks that needed to be done. She also introduced the manipulative perceptual discrimination and puzzles and eye-hand manipulative exercises that she had used with mentally disabled children.

The results surprised her, for unlike her mentally disabled children who had to be prodded to use her apparatus, these very small children were drawn to the work she introduced. Children who had wandered aimlessly the week before began to settle down to long periods of constructive activity. They were fascinated with the puzzles and perceptual training devices.

To Montessori's amazement, children three and four years old took the greatest delight in learning practical everyday living skills that reinforced their independence and self-respect. Each day they begged her to show them more, even applauding with delight when Montessori taught them the correct use of a handkerchief to blow one's own nose. Soon the older children were taking care of the school, assisting their teacher with the preparation and serving of meals and the maintenance of a spotless environment. Their behavior as a group changed dramatically from that of street urchins running wild to models of grace and courtesy. It was little wonder that the press found such a human-interest story appealing and promptly broadcast it to the world.

Montessori education is sometimes criticized for being too structured and academically demand-

ing of young children. Montessori would have laughed at this suggestion. She often said, "I followed these children, studying them, studied them closely, and they taught me how to teach them."

Montessori made a practice of paying close attention to the children's spontaneous behavior, arguing that only in this way could a teacher know how to teach. Traditionally schools at this time paid little attention to children as individuals, other than to demand that they adapt to external standards. Montessori argued that the educator's job is to serve the child, determining what each student needs to make the greatest progress. To her, a child who fails in school should not be blamed, any more than a doctor should blame a patient who does not get well fast enough. Just as it is the job of the physician to help people find the way to cure themselves, it is the educator's job to facilitate the natural process of learning.

Montessori's children exploded into academics. Too young to go to public school, they begged to be taught how to read and write. They learned to do so quickly and enthusiastically, using special manipulative materials that Montessori designed for maximum appeal and effectiveness. The children were fascinated by numbers. To respond to their interest, the mathematically inclined doctor developed a series of concrete math learning materials that still fascinates many mathematicians and educators to this day. Soon her four- and five-year-olds were adding and subtracting four-digit numbers, soon progressing on to multiplication, division, skip counting, and increasingly advanced and abstract concepts.

Their interests blossomed in other areas as well, compelling the overworked physician to spend night after night designing new materials to keep pace with the children in geometry, geography, history, and natural science. Further proof of the children's academic interests came shortly after her first school opened, when a group of well-intentioned women gave the children a collection of lovely and expensive toys. The new gifts held the children's attention for a few days, but they soon returned to the more interesting learning materials. To Montessori's surprise, she found that children who had experienced both generally preferred work over play, at least during the school day. Of the early twenty-first century classroom, Montessori would probably add: "Children read and do advanced mathematics in Montessori schools not because we push them, but because this is what they do when given the correct setting

and opportunity. To deny them the right to learn because we, as adults, think that they should not is illogical and typical of the way schools have been run before.”

Montessori evolved her method through trial and error, making educated guesses about the underlying meaning of the children’s actions. She was quick to pick up on their cues, and constantly experimented with the class. For example, Montessori tells of the morning when the teacher arrived late, only to find that the children had crawled through a window and gone right to work. At the beginning, the learning materials, having cost so much to make, were locked away in a tall cabinet. Only the teacher had a key and would open it and hand the materials to the children upon request. In this instance the teacher had neglected to lock the cabinet the night before. Finding it open, the children had selected one material piece and were working quietly. As Montessori arrived the teacher was scolding the children for taking them out without permission. She recognized that the children’s behavior showed that they were capable of selecting their own work, and removed the cabinet and replaced it with low open shelves on which the activities were always available to the children. This may sound like a minor change, but it contradicted all educational practice and theory of that period.

### **The Discovery of the Child**

One discovery followed another, giving Montessori an increasingly clear view of the inner mind of the child. She found that little children were capable of long periods of quiet concentration, even though they rarely show signs of it in everyday settings. Although they are often careless and sloppy, they respond positively to an atmosphere of calm and order.

Montessori noticed that the logical extension of the young child’s love for a consistent and often repeated routine is an environment in which everything has a place. Her children took tremendous delight in carefully carrying their work to and from the shelves, taking great pains not to bump into anything or spill the smallest piece. They walked carefully through the rooms, instead of running wildly as they did on the streets.

Montessori discovered that the environment itself was all-important in obtaining the results that she had observed. Not wanting to use heavy school

desks, she had carpenters build child-sized tables and chairs. She was the first to do so, recognizing the frustration that a little child experiences in an adult-sized world. Eventually she learned to design entire schools around the size of the children. She had miniature pitchers and bowls prepared and found knives that fit a child’s tiny hand. The tables were lightweight, allowing two children to move them alone. The children learned to control their movements, disliking the way the calm atmosphere was disturbed when they knocked into the furniture. Montessori studied the traffic pattern of the rooms, arranging the furnishings and the activity area to minimize congestion and tripping. The children loved to sit on the floor, so she bought little rugs to define their work areas and the children quickly learned to walk around work that other children had laid out on their rugs.

Montessori carried this environmental engineering throughout the entire school building and outside environment, designing child-sized toilets and low sinks, windows low to the ground, low shelves, and miniature hand and garden tools of all sorts. Many of these ideas were eventually adapted by the larger educational community, particularly at the nursery and kindergarten levels. Many of the puzzles and educational devices in use at the preschool and elementary levels in the early twenty-first century are direct copies of Montessori’s original ideas. However, there is far more of her work that never entered the mainstream, and twenty-first-century educators who are searching for new, more effective answers are finding the accumulated experience of the Montessori community to be of great interest.

### **Worldwide Response**

Maria Montessori’s first Children’s House received overnight attention, and thousands of visitors came away amazed and enthusiastic. Worldwide interest surged as she duplicated her first school in other settings with the same results. Montessori captured the interest and imagination of leaders and scientists around the world. In America, leading figures such as Woodrow Wilson, Alexander Graham Bell, Thomas Edison, and Henry Ford enthusiastically supported her. Through books and countless articles written about and by Montessori, she also became a well-known authority to parents and teachers.

As an internationally respected scientist, Montessori had a rare credibility in a field where many

others had promoted opinions, philosophies, and models that have not been readily duplicated. The Montessori method offers a systematic approach that translates very well to new settings. In the first thirty years of the twentieth century, the Montessori method seemed to offer something for everyone. Conservatives appreciated the calm, responsible behavior of the little children, along with their love for work. Liberals applauded the freedom and spontaneity. Many political leaders saw it as a practical way to reform the outmoded school systems of Europe, North America, and Asia, as well as an approach that they hoped would lead to a more productive and law-abiding populace. Scientists of all disciplines heralded its empirical foundation, along with the accelerated achievement of the little children. Montessori rode a wave of enthusiastic support that many felt should have changed the face of education far more dramatically than it did.

### **The Decline and Resurgence of Interest in Montessori Education in America**

By 1925 there were more than 1,000 Montessori schools in the United States and many tens of thousands more around the world. But by 1940 the movement had virtually disappeared from the American scene. Only a handful of schools remained that openly advertised that they followed the Montessori approach, although many continued to operate without using the name. Education textbooks failed to mention her at all except as an obscure footnote, and her work was virtually forgotten until it was “rediscovered” and brought back to North America in the 1960s by Dr. Nancy McCormick Rambush and the newly formed and rapidly expanding American Montessori Society. During this period, Montessori schools continued to expand in most of the rest of the world.

The question is often asked about what led to the decline of Montessori education in the United States. Several reasons can be reasonably postulated, including the disruption in trans-Atlantic travel during and after World War I and World War II. Many would agree that a highly influential book published in 1922 by Professor William Kilpatrick of Columbia University, *Montessori Reexamined*, may have led many American educators to dismiss Montessori unfairly as being an intellectual holdover from the outdated and no longer accepted theories of faculty psychology. Kilpatrick pronounced that Montessori was rigid, outdated, and mistaken in her attempt to

educate the senses, suggesting that she was under the misapprehension that the brain and senses could be strengthened, like a muscle, by exercises in sensory training and memorization. Unfortunately, this and many other criticisms were unfounded, primarily based on a lack of accurate information and understanding, along with perhaps some bias against Montessori’s popularity as she was a doctor and not a trained educator. Others have suggested that her being a highly articulate and outspoken woman who was openly critical of the schools of her day may have also played a substantial role.

In the early twenty-first century there are almost six thousand Montessori schools in the United States, and their number continues to expand in virtually every country around the world. In America, most Montessori schools are nonpublic and primarily serve early childhood students between the age of two and six. However, the number of public school districts implementing the Montessori approach has grown substantially since the 1980s, with more than 300 districts running more than 500 magnet Montessori schools. As charter schools have developed, Montessori schools are among the most popular and successful models.

Also since the 1980s, Montessori schools have tended to expand in both enrollment and the age levels served, with the majority of schools offering elementary programs as well as early childhood. Secondary Montessori programs are less common, but are beginning to appear in substantial numbers, initially as middle school programs and gradually as high school programs as well.

The largest professional society in the United States is the American Montessori Society in New York City. It accredits Montessori schools and more than fifty university-sponsored and independent Montessori teacher education centers around the United States. Several dozen smaller professional Montessori associations can also be found in the United States. They include the Association Montessori Internationale (AMI), the society founded by Montessori herself in 1929, which has its headquarters in the Netherlands and a national office in Rochester, New York; and the more recently founded umbrella organization for Montessori schools, the International Montessori Council (IMC), which has its American offices in Rockville, Maryland, and Sarasota, Florida. The Montessori Accreditation Council for Teacher Education (MACTE) also accredits Montessori teacher education programs and is rec-

ognized by the United States Department of Education.

Montessori's prime productive period lasted from the opening of the first Children's House in 1907 until the 1930s. During this time, she continued her study of children, and developed a vastly expanded curriculum and methodology for the elementary level as well. Montessori schools were set up throughout Europe and North America, and Montessori gave up her medical practice to devote all of her energies to advocating the rights and intellectual potential of all children.

During her lifetime, Montessori was acknowledged as one of the world's leading educators. As with all innovators, the educational community moved on beyond Montessori, adapting many elements of her work that fit into existing theories and methods. It can be fairly suggested that every classroom in America reflects Montessori's ideas to a fairly substantial degree. Certainly the contemporary attitudes about multiple intelligences, the importance of mental health and emotional literacy, the attractiveness of the modern classroom, the use of manipulative materials in instruction, cooperative learning, authentic assessment, and multiage classrooms as a desirable model for classroom groupings are just a few examples of ideas generally attributed to Maria Montessori.

Ironically, schools are beginning to recognize that the Montessori approach has much more to offer, primarily because to obtain the results that Montessori made world famous, schools must implement her model as a complete restructuring of the school and the teacher's role, rather than as a series of piecemeal reforms.

As understanding of child development has grown, many contemporary American educators and those who would reform education have rediscovered how clear and sensible her insight was. In the early twenty-first century, there is a growing consensus among many psychologists and developmental educators that her ideas and educational model were decades ahead of their time. As the movement gains support and continues to spread into the American public school sector, one can readily say that Montessori, begun at the dawn of the twentieth century, is a remarkably modern approach.

## MORAL DEVELOPMENT

The Swiss psychologist Jean Piaget, author of the 1932 book *The Moral Judgment of the Child*, is among the first psychologists whose work remains directly relevant to contemporary theories of moral development and education. From his observations and interviews of children, Piaget concluded that children begin in a "heteronomous" stage of moral reasoning, characterized by a strict adherence to rules and duties and obedience to authority. This heteronomy results from two factors. The first factor is the young child's cognitive structure. According to Piaget, the thinking of young children is characterized by egocentrism. Young children are unable to simultaneously take into account their own view of things with the perspective of someone else. This egocentrism leads children to project their own thoughts and wishes onto others. It is also associated with the unidirectional view of rules and power associated with heteronomous moral thought and with various forms of "moral realism." Moral realism is associated with "objective responsibility," which is valuing the letter of the law above the purpose of the law. This is why young children are more concerned about the outcomes of actions rather than the intentions of the person doing the act. Moral realism is also associated with the young child's belief in "immanent justice." This is the expectation that punishments automatically follow acts of wrongdoing.

The second major contributor to young children's heteronomous moral thinking is their relative

social relationship with adults. In the natural authority relationship between adults and children, power is handed down from above. The relative powerlessness of young children, coupled with childhood egocentrism, feeds into a heteronomous moral orientation. Nevertheless, through interactions with other children in which the group seeks to play together in a way all find fair, children find this strict heteronomous adherence to rules sometimes problematic. As children consider these situations, they develop towards an “autonomous” stage of moral reasoning, characterized by the ability to consider rules critically and to selectively apply these rules based on a goal of mutual respect and cooperation. The ability to act from a sense of reciprocity and mutual respect is associated with a shift in the child’s cognitive structure from egocentrism to perspective taking. Coordinating one’s own perspective with that of others means that what is right needs to be based on solutions that meet the requirements of fair reciprocity.

Piaget concluded from this work that schools should emphasize cooperative decision-making and problem solving, nurturing moral development by requiring students to work out common rules based on fairness. He believed individuals define morality individually through their struggles to arrive at fair solutions. Given this view, Piaget suggested that classroom teachers should provide students with opportunities for personal discovery through problem solving, rather than indoctrinating students with norms.

### **Lawrence Kohlberg’s Theory of Moral Development and Education**

The American psychologist Lawrence Kohlberg modified and elaborated Piaget’s work and determined that the process of attaining moral maturity took longer and was more gradual than Piaget had proposed. On the basis of his research, Kohlberg identified six stages of moral reasoning grouped into three major levels. At the first, *preconventional* level, a person’s moral judgments are characterized by a concrete, individual perspective. Within this level, a Stage 1 heteronomous orientation focuses on avoiding breaking rules that are backed by punishment, obedience for its own sake, and avoiding the physical consequences of an action. At Stage 2 a moral orientation emerges that focuses on the instrumental, pragmatic values of actions. Reciprocity is of the form: “you scratch my back and I’ll scratch yours.”

Individuals at the second, *conventional*, level reason about moral situations with an understanding that norms and conventions are necessary to uphold society. Within this level, individuals at Stage 3 define what is right in terms of what is expected by people close to them and in terms of the stereotypical roles that define being good—for example, a good brother, mother, teacher. Stage 4 marks the shift from defining what is right in terms of local norms and role expectations to defining right in terms of the laws and norms established by the larger social system. This is the “member of society” perspective in which one is moral by fulfilling the actual duties defining one’s social responsibilities.

Finally, the *postconventional* level is characterized by reasoning based on principles, using a “prior to society” perspective. These individuals reason on the basis of principles that underlie rules and norms. While two stages have been presented within the theory, only one, Stage 5, has received substantial empirical support. Stage 6 remains a theoretical endpoint that rationally follows from the preceding five stages. In essence this last level of moral judgment entails reasoning rooted in the ethical fairness principles from which moral laws would be devised. Laws are evaluated in terms of their coherence with basic principles of fairness rather than upheld simply on the basis of their place within an existing social order.

Kohlberg used findings from his research to reject traditional character education practices that are premised in the idea that virtues and vices are the basis to moral behavior, or that moral character is comprised of a “bag of virtues,” such as honesty, kindness, patience, and strength. Kohlberg believed a better approach to affecting moral behavior would focus on stages of moral development. Initial educational efforts employing Kohlberg’s theory sought to engage students in classroom discussions of moral dilemmas that would lead to an awareness of contradictions inherent in students’ present level of moral reasoning and to shifts toward the next stage of moral judgment. Kohlberg and his colleagues eventually developed the “just community” schools approach toward promoting moral development, described in the 1989 book *Lawrence Kohlberg’s Approach to Moral Education*. These schools seek to enhance moral development by offering students the chance to participate in community discussions to arrive at consensual resolutions of the actual moral

problems and issues students face as members of the school community.

### **Domain Theory: Distinguishing Morality and Convention**

In the early 1970s, longitudinal studies conducted by the Kohlberg research group began to reveal anomalies in the stage sequence. One of the most productive lines of research to come out of that period has been the domain theory advanced by Elliot Turiel and his colleagues. Within domain theory a distinction is drawn between the child's developing concepts of morality and other domains of social knowledge, such as social convention. According to domain theory, the child's concepts of morality and social convention emerge out of the child's attempts to account for qualitatively differing forms of social experience associated with these two classes of social events. Actions within the moral domain, such as unprovoked hitting of someone, have intrinsic effects (i.e., the harm that is caused) on the welfare of another person. Such intrinsic effects occur regardless of the nature of social rules that may or may not be in place regarding the action. Because of this, the core features of moral cognition are centered around considerations of the effects that actions have upon the well-being of persons. Morality is structured by concepts of harm, welfare, and fairness. In contrast, actions that are matters of social convention have no intrinsic interpersonal consequences. For example, there is nothing intrinsic to forms of address that makes calling a college teacher "professor" better or worse than calling the person Ms. or simply using her given name. What makes one form of address better than another is the existence of socially agreed-upon rules. These conventions, while arbitrary, are nonetheless important to the smooth functioning of any social group. Conventions provide a way for members of the group to coordinate their social exchanges through a set of agreed-upon and predictable modes of conduct. Concepts of convention, then, are structured by the child's understandings of social organization. These hypothesized distinctions have been sustained through studies since the mid-1970s that have included interviews with children, adolescents, and adults; observations of child-child and adult-child social interactions; cross-cultural studies; and longitudinal studies examining the changes in children's thinking as they grow older.

Educational research from within domain theory has resulted in a set of recommendations for what

is termed "domain appropriate" values education. This approach entails the teacher's analysis and identification of the moral or conventional nature of social values issues to be employed in lessons. Such an analysis contributes to the likelihood that the issues discussed are concordant with the domain of the values dimension they are intended to affect. Teachers are also better enabled to lead students through consideration of more complex issues that contain elements from more than one domain.

### **Carol Gilligan and the Morality of Care**

Carol Gilligan, in a 1982 book titled *In a Different Voice: Psychological Theory and Women's Development*, suggested that a morality of care can serve in the place of the morality of justice and rights espoused by Kohlberg. A way to look at how these differ is to view these two moralities as providing two distinct injunctions—the injunction not to treat others unfairly (justice) and the injunction not to turn away from someone in need (care). She presents these moralities as distinct, although potentially connected. In her initial work, Gilligan emphasized the gender differences thought to be associated with these two orientations. Further research has suggested, however, that moral reasoning does not follow the distinct gender lines that Gilligan originally reported. The preponderance of evidence is that both males and females reason based on justice and care. While this gender debate is unsettled, Gilligan's work has contributed to an increased awareness that care is an integral component of moral reasoning. Educational approaches based on Gilligan's work have emphasized efforts to foster empathy and care responses in students.

### **Persisting Controversies**

Three primary controversies persist in the field of moral development research. First, there is disagreement over whether morality has universal elements or is cross-cultural. Second, there is disagreement over whether morality develops in stages or levels. Finally, there are unresolved issues regarding the connections between moral judgments and action. The latter is of greatest concern to educators because one of the primary goals of education is to produce citizens who will lead moral lives. The most promising line of work attempting to deal with this issue is exploring the development of what is referred to as the "moral self." This approach assumes that people act on the basis of their moral judgments if being

moral is a central part of their sense of personal identity.

## MORAL EDUCATION

Only a handful of educational theorists hold the view that if only the adult world would get out of the way, children would ripen into fully realized people. Most thinkers, educational practitioners, and parents acknowledge that children are born helpless and need the care and guidance of adults into their teens and often beyond. More specifically, children need

to learn how to live harmoniously in society. Historically, the mission of schools has been to develop in the young both the intellectual and the moral virtues. Concern for the moral virtues, such as honesty, responsibility, and respect for others, is the domain of moral education.

Moral education, then, refers to helping children acquire those virtues or moral habits that will help them individually live good lives and at the same time become productive, contributing members of their communities. In this view, moral education should contribute not only to the students as individuals, but also to the social cohesion of a community. The word *moral* comes from a Latin root (*mos, moris*) and means the code or customs of a people, the social glue that defines how individuals should live together.

### A Brief History of Moral Education

Every enduring community has a moral code and it is the responsibility and the concern of its adults to instill this code in the hearts and minds of its young. Since the advent of schooling, adults have expected the schools to contribute positively to the moral education of children. When the first common schools were founded in the New World, moral education was the prime concern. New England Puritans believed the moral code resided in the Bible. Therefore, it was imperative that children be taught to read, thus having access to its grounding wisdom. As early as 1642 the colony of Massachusetts passed a law requiring parents to educate their children. In 1647 the famous Old Deluder Satan Act strengthened the law. Without the ability to read the Scriptures, children would be prey to the snares of Satan.

**The colonial period.** As common school spread throughout the colonies, the moral education of children was taken for granted. Formal education had a distinctly moral and religion emphasis. Harvard College was founded to prepare clergy for their work. Those men who carved out the United States from the British crown risked their fortunes, their families, and their very lives with their seditious rebellion. Most of them were classically educated in philosophy, theology, and political science, so they had learned that history's great thinkers held democracy in low regard. They knew that democracy contained within itself the seeds of its own destruction and could degenerate into mobocracy with the many preying on the few and with political leaders pandering to the citizenry's hunger for bread and circuses.

The founders' writings, particularly those of Thomas Jefferson, James Madison, John and Abigail Adams, and Benjamin Franklin, are filled with admonitions that their new country make education a high priority. While the early leaders saw economic reasons for more and longer schooling, they were convinced that the form of government they were adopting was, at heart, a moral compact among people.

**Nineteenth century.** As the young republic took shape, schooling was promoted for both secular and moral reasons. In 1832, a time when some of the Founding Fathers were still alive, Abraham Lincoln wrote, in his first political announcement (March 9, 1832), "I desire to see a time when education, and by its means, morality, sobriety, enterprise and industry, shall become much more general than at present." Horace Mann, the nineteenth-century champion of the common schools, strongly advocated for moral education. He and his followers were worried by the widespread drunkenness, crime, and poverty during the Jacksonian period in which they lived. Of concern, too, were the waves of immigrants flooding into cities, unprepared for urban life and particularly unprepared to participate in democratic civic life. Mann and his supporters saw free public schools as the ethical leaven of society. In 1849, in his twelfth and final report to the Massachusetts Board of Education, he wrote that if children age four to sixteen could experience "the elevating influences of good schools, the dark host of private vices and public crimes, which now embitter domestic peace and stain the civilization of the age, might, in 99 cases in every 100, be banished from the world" (p. 96).

In the nineteenth century, teachers were hired and trained with the clear expectation that they would advance the moral mission of the school and attend to character formation. Literature, biography, and history were taught with the explicit intention of infusing children with high moral standards and good examples to guide their lives. Students' copy-book headings offered morally uplifting thoughts: "Quarrelsome persons are always dangerous companions" and "Praise follows exertion." The most successful textbooks during the nineteenth and early twentieth centuries were the famed McGuffey readers, which were filled with moral stories, urgings, and lessons. During this period of our evolution as a nation, moral education was deep in the very fabric of our schools.

There was, however, something else in the fabric of moral education that caused it to become problematic: religion. In the United States, as a group of colonies and later as a new nation, the overwhelming dominant religion was Protestantism. While not as prominent as during the Puritan era, the King James Bible was, nevertheless, a staple of U.S. public schools. The root of the moral code was seen as residing there. However, as waves of immigrants from Ireland, Germany, and Italy came to the country from the mid-nineteenth century forward, the pan-Protestant tone and orthodoxy of the schools came under scrutiny and a reaction set in. Concerned that their children would be weaned from their faith, Catholics developed their own school system. Later in the twentieth century, other religious groups, such as Jews, Muslims, and even various Protestant denominations, formed their own schools. Each group desired, and continues to desire, that its moral education be rooted in its respective faith or code.

**Twentieth century.** During this same late-nineteenth-century and twentieth-century period, there was also a growing reaction against organized religion and the belief in a spiritual dimension of human existence. Intellectual leaders and writers were deeply influenced by the ideas of the English naturalist Charles Darwin, the German political philosopher Karl Marx, the Austrian neurologist and founder of psychoanalysis Sigmund Freud, and the German philosopher and poet Friedrich Nietzsche, and by a growing strict interpretation of the separation of church and state doctrine. This trend increased after World War II and was further intensified by what appeared to be the large cracks in the nation's moral consensus in the late 1960s. Since for so many Americans the strongest roots of moral truths reside in their religious beliefs, educators and others became wary of using the schools for moral education. More and more this was seen to be the province of the family and the church. Some educators became proponents of "value-free" schooling, ignoring the fact that it is impossible to create a school devoid of ethical issues, lessons, and controversies.

During the last quarter of the twentieth century, as many schools attempted to ignore the moral dimension of schooling, three things happened: Achievement scores began to decline, discipline and behavior problems increased, and voices were raised accusing the schools of teaching secular humanism. As the same time, educators were encouraged to

address the moral concerns of students using two approaches: values clarification and cognitive developmental moral education.

The first, *values clarification*, rests on little theory other than the assumption that students need practice choosing among moral alternatives and that teachers should be facilitators of the clarification process rather than indoctrinators of particular moral ideas or value choices. This approach, although widely practiced, came under strong criticism for, among other things, promoting moral relativism among students. While currently few educators confidently advocate values clarification, its residue of teacher neutrality and hesitance to actively address ethical issues and the moral domain persists.

The second approach, *cognitive developmental moral education*, sprang from the work of the Swiss psychologist Jean Piaget and was further developed by Lawrence Kohlberg. In contrast to values clarification, cognitive moral development is heavy on theory and light on classroom applications. In its most popular form, Kohlberg posited six sequential stages of moral development, which potentially individuals could achieve. Each stage represents a distinctive way an individual thinks about a moral situation or problem. Teachers are encouraged to engage students from an early age and throughout their schooling in discussion of moral issues and dilemmas. In the later years of his life, Kohlberg was urging educators to transform their schools into “just communities,” environments within which students’ moral stage development would accelerate.

### The Return of Character Education

In the early 1980s, amid the widespread concern over students’ poor academic achievements and behavior, educators rediscovered the word *character*. Moral education had a religious tinge, which made many uneasy. Character with its emphasis on forming good habits and eliminating poor habits struck a popular and traditional chord. The word *character* has a Greek root, coming from the verb “to engrave.” Thus character speaks to the active process of making marks or signs (i.e., good habits) on one’s person. The early formation of good habits is widely acknowledged to be in the best interests of both the individual and society.

In addition, character formation is recognized as something that parents begin early, but the work is hardly completed when a child goes to school. Im-

PLICIT in the concept of character is the recognition that adults begin the engraving process of habituation to consideration of others, self-control, and responsibility, then teachers and others contribute to the work, but eventually the young person takes over the engraving or formation of his own character. Clearly, though, with their learning demands and taxing events, children’s school years are a prime opportunity for positive and negative (i.e., virtues and vices) character formation.

The impetus and energy behind the return of character education to American schools did not come from within the educational community. It has been fueled, first, by parental desire for orderly schools where standards of behavior and good habits are stressed, and, second, by state and national politicians who responded to these anxious concerns of parents. During his presidency, William Clinton hosted five conferences on character education. President George W. Bush expanded on the programs of the previous administration and made character education a major focus of his educational reform agenda. One of the politically appealing aspects of character education, as opposed to moral education with its religious overtones, is that character education speaks more to the formation of a good citizen. A widely repeated definition (i.e., character education is helping a child to know the good, to desire the good, and to do the good) straddles this issue. For some people the internal focus of character education comfortably can be both religious and civic and for others the focus can be strictly civic, dealing exclusively on the formation of the good citizen.

### Current Approaches to Moral Education

The overwhelming percentage of efforts within public education to address the moral domain currently march under the flag of character education. Further, since these conscious efforts at addressing issues of character formation are relatively recent, they are often called *character education programs*. The term *program* suggests, however, discrete initiatives that replace an activity or that are added to the school’s curriculum (e.g., a new reading program or mathematics program). And, although there are character education programs available, commercially and otherwise, most advocates urge the public schools to take an infusion approach to educating for character.

**The infusion approach.** In general, an *infusion approach* to character education aims to restore the formation of students' characters to a central place in schooling. Rather than simply adding on character formation to the other responsibilities of schools, such as numeracy, literacy, career education, health education, and other goals, a focus on good character permeates the entire school experience. In essence, character education joins intellectual development as the overarching goals of the school. Further, character education is seen, not in competition with or ancillary to knowledge- and skill-acquisition goals, but as an important contributor to these goals. To create a healthy learning environment, students need to develop the virtues of responsibility and respect for others. They must eliminate habits of laziness and sloppiness and acquire habits of self-control and diligence. The infusion approach is based on the view that the good habits that contribute to the formation of character in turn contribute directly to the academic goals of schooling.

A mainstay of the infusion approach is the recovery, recasting, or creating of a school's mission statement, one that reflects the priority placed on the development of good character. Such a statement legitimizes the attention of adults and students alike to this educational goal. It tells administrators that teachers and staff should be hired with good character as a criterion; it tells teachers that not only should character be stressed to students but also their own characters are on display; it tells coaches that athletics should be seen through the lens of sportsmanship rather than winning and losing; and it tells students that their efforts and difficulties, their successes and disappointments are all part of a larger process, the formation of their characters.

Critical to the infusion approach is using the curriculum as a source of character education. This is particularly true of the language arts, social studies, and history curricula. The primary focus of these subjects is the study of human beings, real and fictitious. Our great narrative tales carry moral lessons. They convey to the young vivid images of the kinds of people our culture admires and wants them to emulate. These subjects also show them how lives can be wasted, or worse, how people can betray themselves and their communities. Learning about the heroism of former slave Sojourner Truth, who became an evangelist and reformer, and the treachery of Benedict Arnold, the American army officer

who betrayed his country to the British, is more than picking up historical information. Encountering these lives fires the student's moral imagination and deepens his understanding of what constitutes a life of character. Other subjects, such as mathematics and science, can teach students the necessity of intellectual honesty. The curricula of our schools not only contain the core knowledge of our culture but also our moral heritage.

In addition to the formal or overt curriculum, schools and classrooms also have a hidden or covert curriculum. A school's rituals, traditions, rules, and procedures have an impact on students' sense of what is right and wrong and what is desired and undesired behavior. So, too, does the school's student culture. What goes on in the lunchroom, the bathrooms, the locker rooms, and on the bus conveys powerful messages to students. This ethos or moral climate of a school is difficult to observe and neatly categorize. Nevertheless, it is the focus of serious attention by educators committed to an infusion approach.

An important element of the infusion approach is the language with which a school community addresses issues of character and the moral domain. Teachers and administrators committed to an infusion approach use the language of virtues and speak of good and poor behavior and of right and wrong. Words such as responsibility, respect, honesty, and perseverance are part of the working vocabulary of adults and students alike.

**Other approaches.** One of the most popular approaches to character education is service learning. Sometimes called community service, this approach is a conscious effort to give students opportunities, guidance, and practice at being moral actors. Based on the Greek philosopher Aristotle's concept of character formation (e.g., a man becomes virtuous by performing virtuous deeds; brave by doing brave deeds), many schools and school districts have comprehensive programs of service learning. Starting in kindergarten, children are given small chores such as feeding the classroom's gerbil or straightening the desks and chairs. They later move on to tutoring younger students and eventually work up to more demanding service activities in the final years of high school. Typically, these high-school level service-learning activities are off-campus at a home for the blind, a hospital, or a day-care center. Besides placement, the school provides training, guidance, and

problem-solving support to students as they encounter problems and difficulties.

In recent years, schools across the country have adopted the virtue (or value) of the month approach, where the entire school community gives particular attention to a quality such as cooperation or kindness. Consideration of the virtue for that particular month is reflected in the curriculum, in special assemblies, in hallway and classroom displays, and in school-home newsletters. Related to this are schoolwide programs, such as no put-downs projects, where attention is focused on the destructive and hurtful effects of sarcasm and insulting language and students are taught to replace put-downs with civil forms of communication.

There are several skill-development and classroom strategies that are often related to character formation. Among the more widespread are teaching mediation and conflict-resolution skills, where students are given direct teaching in how to deal with disagreements and potential fights among fellow students. Many advocates of cooperative learning assert that instructing students using this instructional process has the added benefit of teaching students habits of helping others and forming friendships among students with whom they otherwise would not mix.

### Issues and Controversies

The moral education of children is a matter of deep concern to everyone from parents to civic and religious leaders. It is no accident, then, that this subject has been a matter of apprehension and controversy throughout the history of American schools. Issues of morality touch an individual's most fundamental beliefs. Since Americans are by international standards both quite religiously observant and quite religiously diverse, it is not surprising that moral and character education controversies often have a religious source. Particularly after a period when moral education was not on the agenda of most public schools, its return is unsettling to some citizens. Many who are hostile to religion see this renewed interest in moral education as bringing religious perspectives back into the school "through the back door." On the other hand, many religious people are suspicious of its return because they perceive it to be an attempt to undermine their family's religious-based training with a state-sponsored secular humanism. As of the beginning of the twenty-first cen-

ture, however, the renewed attention to this area has been relatively free of controversy.

Contributing to the positive climate is the use of the term *character* rather than *moral*. While *moral* carries religious overtones for many, the word *character* speaks to good habits and the civic virtues, which hold a community together and allow us to live together in harmony.

A second issue relates to the level of schools and the age of students. The revival of character education in our schools has been evident to a much greater degree in elementary schools. Here schools can concentrate on the moral basics for which there is wide public consensus. The same is true, but to a somewhat lesser degree, for middle and junior high schools. And although there are many positive examples of secondary schools that have implemented broad and effective character education programs, secondary school faculties are hesitant to embrace character education. Part of it is the departmental structures and the time demands of the curriculum; part of it is the age and sophistication of their students; and part of it is that few secondary school teachers believe they have a clear mandate to deal with issues of morality and character.

A third issue relates to the education of teachers. Whereas once teachers in training took philosophy and history of education—courses that introduced them to the American school's traditional involvement with moral and character education—now few states require these courses. At the beginning of the twenty-first century, the American schools are seeing the large-scale retirement of career teachers and their replacement with large numbers of new teachers. These young teachers tend to be products of elementary and secondary schools where teachers gave little or no direct attention to moral and character education. In addition, a 1999 study by the Character Education Partnership of half of the nation's teacher education institutions showed that although over 90 percent of the leaders of these programs thought character education ought to be a priority in the preparation of teachers, only 13 percent were satisfied with their institution's efforts.

### Evaluation of Moral and Character Education

There are a few character education programs with encouraging evaluation results. The Character Development Project (CDP) has more than 18 years of involvement in several K–6 schools, and in those

schools where teachers received staff development and on-site support over 52 percent of the student outcome variables showed significant differences. The Boy Scouts of America developed the Learning For Life Curriculum in the early 1990s for elementary schools. This commercially available, stand-alone curriculum teaches core moral values, such as honesty and responsibility. In a large-scale controlled experiment involving fifty-nine schools, students exposed to the Learning For Life materials showed significant gains on their understanding of the curriculum's core values, but they were also judged by their teachers to have gained greater self-discipline and ability to stay on a task.

Still, evaluation and assessment in character and moral education is best described as a work in progress. The field is held back by the lack of an accepted battery of reliable instruments, a lack of wide agreement on individual or schoolwide outcomes, and by the short-term nature of most of the existent studies. Complicating these limitations is a larger one: the lack of theoretical agreement of what character is. Human character is one of those overarching entities that is the subject of disciples from philosophy to theology, from psychology to sociology. Further, even within these disciplines there are competing and conflicting theories and understandings of the nature of human character. But although the evaluation challenges are daunting, they are dwarfed by the magnitude of the adult community's desire to see that our children possess a moral compass and the good habits basic to sound character.

#### MORRISON, HENRY C. (1871–1945)

New Hampshire state superintendent of public instruction, superintendent of the Laboratory Schools

of the University of Chicago, professor, and author, Henry Clinton Morrison developed an approach to learning in which material is organized into units students must master in order to progress to the next level. His five-step general pattern for the instructional process became well known as the Morrison Plan (also called the Morrison Method). Morrison's conception of mastery learning served as precursor to the "individualized instruction" and "mastery learning" educational movements of the 1970s and 1980s.

Morrison was born the son of John and Mary Louise (Ham) Morrison in Oldtown, Maine, a rugged fishing and lumber town in the middle of the Penobscot River. He worked in the lumber camps, but his own and his parents' earnings from the general merchandise store they ran could not finance his college education. Because Morrison had distinguished himself in his preparatory work for college, a local banker and the selectmen of the town raised money to finance his education at Dartmouth College. Morrison chose the college's classical course, with a concentration in philosophy. Robert Frost was a classmate. Morrison was graduated from Dartmouth with a Bachelor of Arts degree in 1895, one of two students to graduate magna cum laude.

Morrison served as a teaching principal at the consolidated high school in Milford, New Hampshire, from 1895 through 1899. Although he taught mathematics, history, Latin, and the sciences, he quickly became known for his abilities to organize and manage unruly students. The reputation Morrison built for Milford as a well-disciplined school earned him, at age twenty-eight, an appointment as superintendent of schools for Portsmouth, New Hampshire. He served in this position from 1899 to 1904. In 1902 he married Marion Locke; the couple had three sons.

In 1904 Morrison was appointed commissioner of public instruction for the state of New Hampshire. He served in this role as state superintendent until 1917 and during this time Morrison examined and approved all schools within the state, served on the state medical board, conducted teachers' examinations, and supervised attendance and child labor laws. In addition, during the summer of 1905, Morrison lectured on school administration at Dartmouth. In 1908 he was elected president of the American Institute of Instruction. In 1912 Morrison was invited by Charles Hubbard Judd, dean of the School of Education at the University of Chicago, to

be guest lecturer for the summer session at Chicago; Morrison thus strengthened initial ties with Judd, whom he had first met in 1911, that were to be most important later in his educational career. Morrison concluded his service as state superintendent of New Hampshire abruptly in 1917. From 1917 to 1919 Morrison lived in Connecticut and served as the assistant secretary of the State Board of Education.

In 1919 the position of superintendent of the Laboratory Schools of the University of Chicago became vacant. By then, Judd was well acquainted with Morrison's educational accomplishments and administrative expertise. On July 1, 1919, Morrison became professor of School Administration and superintendent of the Laboratory Schools, a position that he held until 1928.

In Morrison's educational career up to 1919, he had "insider" knowledge, as both teacher and administrator, of problems that plagued public education in the United States. From 1919 through 1928, he conceptualized theories for approaching these problems, tested tentative solutions within laboratory school contexts, and conducted a vast amount of empirical observation.

From Morrison's studies, he posited that genuine learning consisted of the student adapting or responding to a situation. Rejecting the notion that learning referred only to the acquisition of subject matter, Morrison instead concentrated on actual change in the behavior of the learner, what he called an adaptation. The unit was the procedure used for the teaching of an adaptation based on a stimulus-response psychology. This concept stems, in part, from Morrison's categorization of learning into a cycle of three phases: stimulus, assimilation, and reaction.

Morrison configured the secondary school curriculum into units of five types: science, appreciation, practical arts, language arts, and pure-practice. Acknowledging that instruction would vary among the different types of units, Morrison nonetheless identified a five-step instructional pattern. Morrison's general pattern for the instructional process (his plan or method) involves the following sequential steps: (1) pretest, (2) teaching, (3) testing the result of instruction, (4) changing the instruction procedure, and (5) teaching and testing again until the unit has been completely mastered by the student. In developing his concept of mastery learning, Morrison distinguished between learning and per-

formance. Mastery, according to Morrison, is when students focus on learning a skill and acquire a fundamental grasp of subject matter. Once students have achieved a certain level of learning, they attempt to apply the skill; this application is called performance. The next step achieved is adaptation, the stage at which students become able to apply their learning to any situation.

Morrison's landmark publication, *The Practice of Teaching in the Secondary Schools* (1926), was the synthesis of his teaching, administrative, and research experiences. His book is widely regarded as one of the best known and most widely used systems of teaching from the late 1920s through the early 1940s. In this book, Morrison also drew a distinction between curriculum and instruction, thus marking the beginning of a major conceptual distinction between these two areas in the field of education.

Although Morrison's historical significance stems primarily from *The Practice of Teaching in the Secondary Schools*, he also brought important empirical analyses to the areas of school finance and organization, and administration of schools. Toward the end of school term in 1928, Morrison requested that he be transferred to the Department of Education and relieved of his position as superintendent of the Laboratory Schools. On July 1, 1937, Morrison retired from the University of Chicago; on March 19, 1945, he suffered a heart attack in the garden of his Hyde Park residence and died.

## OVERVIEW

Motivation is the study of why people think and behave as they do. In an achievement setting, someone would be concerned with motivation if he were to ask, for example, why some students persist to task completion despite enormous difficulty, while others give up at the slightest provocation; or why some students set such unrealistically high goals for themselves that failure is bound to occur.

Motivation is also the study of what pushes or pulls an individual to start, direct, sustain, and finally end an activity. Consider, for example, an achievement activity such as studying for an exam. Motivation researchers would want to examine what the person is doing: the choice of behavior; how long it takes that person to get started. Or they wish to see the latency of behavior: how hard the individual actually works at the activity (the intensity of behavior); how long that individual is willing to remain at the activity (the persistence of behavior); and what the person is thinking or feeling while engaged in the activity, or the cognitions and emotional reactions that accompany behavior. Note that this focus on the "why" of achievement is quite different from the

study of achievement itself. Educators sometimes confuse the topics of researchers who study motivation with the topics of researchers who study achievement and learning.

### Early Theories

The scientific study of motivation as a discipline separate from learning began in the 1930s. Early motivation researchers were primarily interested in the factors that aroused behavior, or that got it started in the first place. It was widely believed at the time that the optimal state of an organism, both animal and human, was one of balance and equilibrium, where all needs were satisfied. The process of keeping the organism at this optimal level is known as homeostasis. Homeostatic balance was also thought to be satisfying, which was compatible with the belief that organisms were primarily motivated by hedonism, or the desire to maximize pleasure and minimize pain. Theories of motivation that emerged in the 1930s were based on the ideas of homeostasis and hedonism as fundamental principles.

**Drive theory.** The best known of these early conceptions was Clark Hull's drive theory. According to Hull, behavior is a function of drive and habit. Drives in the Hullian framework are unsatisfied needs, such as the need for food (hunger) or the need for water (thirst). The drive to satisfy one's needs is what arouses or energizes behavior. Habits, in turn, provide a direction for behavior. Habits are stimulus response bonds that are built up over time as a result of prior learning. For example, if someone's need to achieve has been satisfied in the past by studying hard for exams, then deficits in that need (arousal) should be satisfied by renewed study behavior. Thus behavior can be explained by both a motivation component (the drive that energizes behavior) and a learning component (the habit that provides direction or indicates what particular behavior will be initiated).

Simple yet elegant, drive theory generated a vast amount of motivation research from the 1930s through the 1950s. Of most relevance to education were studies on anxiety and learning conducted by Kenneth Spence, who was a student of Hull's. According to Spence, anxiety is a drive and it therefore arouses behavior, in this case the speed with which one learns simple versus complex tasks. On simple tasks where there is already a strong habit strength, anxiety will facilitate the speed of learning. With complex tasks, on the other hand, where there are

weak stimulus-response bonds, high anxiety should interfere with learning, because high anxiety activates incorrect stimulus-response bonds (habits) that compete with correct responses. In support of this analysis, many studies reveal that high anxiety is neither uniformly adaptive or maladaptive across all learning contexts.

**Expectancy-value theory.** Drive theory was very mechanistic. There was no role for complex cognitive processes such as how a person interprets an arousal cue or whether their expectations for success might energize behavior. With the cognitive revolution of the 1960s, motivation researchers became much more interested in how thoughts as well as unsatisfied needs and habits influenced behavior. The impact of drives as an organizing construct therefore waned. Furthermore, it became accepted that organisms are always active and the field of motivation shifted from the study of what turns organisms "on" and "off" to an interest in the direction of behavior, including choice and persistence.

The interest in cognition resulted in what is known as expectancy-value theory in motivation. The basic assumptions of expectancy-value theory are in accord with commonsense thinking about motivated behavior. Behavioral choice is determined by the perceived likelihood that the behavior will lead to a goal and how much that goal is desired or wanted. In the 1950s and 1960s, John Atkinson developed a theory of achievement motivation that perhaps best illustrates an expectancy-value framework. In its simplest form, Atkinson's theory states that the tendency to approach as achievement activity ( $T_s$ ) is a function of three factors: the motive for success ( $M_s$ ), the probability that one will be successful at the activity ( $P_s$ ), and the incentive value of success ( $I_s$ ). The factors are related multiplicatively, such that:  $T_s = M_s \times P_s \times I_s$ .

In this equation,  $M_s$  is the achievement motive, a relatively enduring personality trait presumed to be learned early in life.  $P_s$ , or the probability of success, takes on a numerical value from 0 to 1, with high numbers (e.g.,  $P_s = 0.8$ ) indicating greater likelihood of success, that is, an easy task. Finally, incentive value ( $I_s$ ) represents an affective state, labeled pride in accomplishment, and it was assumed to be inversely related to expectancy ( $1 - P_s$ ). That relationship captured the notion that easier tasks, where the probability of success was high, would elicit less pride and would therefore be less motivating.

Atkinson's theory was very popular from 1960 to 1980 and it generated many intriguing hypotheses about motivation. The theory predicted that high achievement oriented people prefer tasks of intermediate difficulty ( $P_s = 0.5$ ) because such tasks elicited the most pride following success. People who were low in the achievement motive would be more motivated when tasks were very easy or very difficult. Atkinson was among the first theorists to point out that adaptive motivation was not necessarily associated with persisting at the hardest tasks where the probability of success is low. Indeed, the hallmark of a high achievement-oriented person is that they are able to gauge their efforts in response to their perceived expectancy, always striving toward intermediate difficulty.

### Contemporary Theories of Motivation

Atkinson's theory gradually declined in the 1980s as motivation researchers turned their attention to a broader array of cognitions and to motivational traits other than the achievement motive. In general, contemporary motivation theories are dominated by three separate but interrelated constructs: expectancy, value, and achievement goals. As defined in the early twenty-first century, expectancy has to do with beliefs about ability (Can I do it?). Values are concerned with preferences and desires (Do I want it?). And goals capture purpose or the reasons for engaging in achievement activities (Why am I doing this?).

**Beliefs about ability: Attribution theory.** Three theories have addressed beliefs about ability. The first is attribution theory as developed by Bernard Weiner. Attributions are inferences about the causes of success and failure. (e.g., "Why did I get a poor grade on the exam?" or "Why did I get the highest grade?") Among the most prevalent inferred causes of success and failure are ability (aptitude), effort, task difficulty or ease, luck, mood, and help or hindrance from others. According to Weiner, these causes have certain underlying characteristics, which are known as causal dimensions. Causes differ in locus, or whether the cause is internal or external to the person; stability, which designates as cause as constant or varying over time; and in controllability, or the extent to which a cause is subject to volitional alteration. For example, low aptitude as a cause for failure is considered to be internal to the actor, stable over time, and uncontrollable, whereas lack of effort is judged as internal, but variable over time and subject to volitional control.

Each of these causal dimensions is linked to particular consequences that have motivational significance. For example, the stability dimension is related to expectancy for future success. When failure is attributed to a stable cause such as low ability, one is more likely to expect the same outcome to occur again than when the cause of failure is due to an unstable factor such as lack of effort. Thus the failing student who believes that he or she did not try hard enough can be bolstered by the expectation that failure need not recur again. Guided by these known linkages between causal stability and expectancy, attribution retraining programs have been developed that teach students to attribute failure to lack of effort rather than lack of ability. Many successful programs have been reported in which retrained students show greater persistence when they encounter challenging tasks, more confidence, and more positive attitudes toward school work.

The controllability dimension is related to a number of interpersonal affects, such as pity and anger. Pity and sympathy are experienced toward others whose failures are caused by uncontrollable factors (think of the teacher's reactions to the retarded child who continually experiences academic difficulty). In contrast, anger is elicited when others' failures are due to causes within their control (imagine that same teacher's affect toward the gifted student who never completes assignments). These emotional reactions also can serve as indirect attributional cues (i.e., they provide information about the cause of achievement). If a teacher expresses pity and sympathy following student failure, that student tends to make a low ability attribution. Hence, pity from others can undermine beliefs about ability.

**Beliefs about ability: Self-efficacy theory.** Popularized by Albert Bandura, self-efficacy refers to individuals' beliefs about their capabilities to perform well. When confronted with a challenging task, a person would be enlisting an efficacy belief if they asked themselves: "Do I have the requisite skills to master this task?" Unlike causal beliefs in attribution theory, which are explanations for past events, efficacy percepts are future oriented. They resemble expectations for personal mastery of subsequent achievement tasks. Also unlike attribution theory, which focuses on the perceived stability of causes as a determinant of expectancy, efficacy theorists have articulated a much more extensive set of antecedents, including prior accomplishments, modeling, persuasion, and emotional arousal. For example,

physiological symptoms signaling anxiety, such as rapid heart beat or sweaty palms, might function as cues to the individual that he or she lacks the requisite skills to successfully complete a task.

According to Bandura, perceived efficacy determines how much effort a person is willing to put into an activity as well as how long they will persevere in the face of obstacles. Many studies have documented the adaptive consequences of high self-efficacy. For example, it is known that high self-efficacy and improved performance result when students: (1) adopt short-term over long-term goals, inasmuch as progress is easier to judge in the former case; (2) are taught to use specific learning strategies, such as outlining and summarizing, both of which increase attention to the task; and (3) receive performance-contingent rewards as opposed to reinforcement for just engaging in a task, because only in the former case does reward signal task mastery. All these instructional manipulations are assumed to increase the belief that “I can do it,” which then increases both effort and achievement. Efficacy beliefs have been related to the acquisition of new skills and to the performance of previously learned skills at a level of specificity not found in any other contemporary theory of motivation.

#### **Beliefs about ability: Learned helplessness theory.**

Whereas self-efficacy captures lay understanding of “I can,” helplessness beliefs symbolize shared understanding about the meaning of “I cannot.” According to this theory, a state of helplessness exists when failures are perceived as insurmountable, or more technically, when noncontingent reinforcement results in the belief that events are uncontrollable. That belief often is accompanied by passivity, loss of motivation, depressed affect, and performance deterioration. Martin Seligman, a main proponent of the theory, has argued that helplessness becomes a learned phenomenon when individuals inappropriately generalize from an experience with noncontingency in one situation to subsequent situations where control is possible. A prototypical example is the successful student who unexpectedly fails despite high effort and then becomes virtually incapable of completing work that was easily mastered prior to failure.

Helplessness theory has a decidedly attributional focus in that Seligman and others maintain that when individuals encounter failure, they ask, “Why?” How people characteristically answer this question is known as explanatory style. Some people

typically explain bad events by pointing to factors that are internal, stable, and global. (e.g., “I’m always a failure no matter what I do”). These individuals are believed to have a pessimistic explanatory style. Other people interpret bad events by evoking momentary and specific causes (e.g., “I just happened to be in the wrong place at the wrong time”). Such individuals are characterized as having an optimistic explanatory style. A pessimistic explanatory style in the achievement domain has been related to poor school grades, reluctance to seek help, diminished aspirations, and ineffective use of learning strategies.

The research of Carol Dweck has focused particularly on individual differences the motivational patterns of children who may be vulnerable to helplessness beliefs. In response to challenging tasks where failure is possible, some children have a mastery-oriented motivational system: they believe that ability is incremental (e.g., “smartness is something you can increase as much as you want”), they focus on the task rather than their abilities, they enjoy challenge, and they can generate solution-oriented strategies that lead to performance enhancement. At the other end of the continuum are children who display a helpless motivational pattern: they believe that ability is fixed (e.g., “how smart you are pretty much stays the same”); they focus on personal inadequacies; express negative affect, including boredom and anxiety; and they show marked deterioration in actual performance. In other words, they display the classic symptoms associated with learned helplessness.

In summary, the dominant theme in contemporary motivation research revolves around beliefs about ability as represented by attribution theory, self-efficacy theory, and learned helplessness theory. Attribution theory has its origins in social psychology and is therefore especially concerned with the situational determinants of motivation and with both self-perception and the perception of others. Self-efficacy theory has emerged from a social learning perspective and therefore has close ties with behavioral change. Learned helplessness theory reflects the influence of clinical and personality psychology with its focus on coping with failure and individual differences in a presumed motivational trait.

**Achievement values.** There is a much smaller literature on achievement values, the other broad construct in expectancy-value approaches to motivation. Unlike expectancy, which focuses on beliefs about ability, values are more directly

concerned with the perceived importance, attractiveness, or usefulness of achievement activities. Values also are rooted in the moral constructs of “ought” and “should,” as illustrated by the belief that one should try hard in school regardless of his or her perceived abilities.

The most extensive research on achievement values has been conducted by Jacques Eccles and Allan Wigfield. These researchers define achievement tasks in terms of their attainment value (the perceived importance of doing well), intrinsic value (how much enjoyment the individual derives from engaging in the task), utility value (how the task relates to future goals), and costs (the undesirable consequences of engaging in the task). Most of the research guided by this conception has selected specific subject matter domains to examine whether task value predicts different consequences, such as course grades and enrollment decisions, or the extent to which value and expectancy are positively or negatively related (according to Atkinson’s theory, these two constructs,  $I_s$  and  $P_s$ , should be inversely related). The findings of Eccles and Wigfield reveal that how much students value a particular domain influences choice behavior (i.e., their intention to enroll in particular courses and their actual enrollment). Task values, however, have little direct impact on actual course grades. Value and expectancy also appear to be positively correlated: individuals judge the tasks that they perceive themselves to be good at as more important, enjoyable, and useful. An unanswered question in this research is the issue of causal sequence. It is unclear whether individuals come to value what they are good at (expectancy  $\rightarrow$  value), or whether individuals develop more confidence over time in the tasks that are most important (value  $\rightarrow$  expectancy).

**Achievement goals.** Achievement goals capture the reasons why a person engages in achievement behavior, and two broad types have been identified. Students who pursue mastery goals are oriented toward acquiring new skills or improving their level of competence. In contrast, students who adopt performance goals are motivated by the intent to demonstrate that they have adequate ability and avoid displaying signs that they have low ability. According to this analysis, individuals can therefore decide to engage in achievement activities for two very different reasons: They may strive to develop competence by learning as much as they can, or they may

strive to publicly display their competence by trying to outperform others.

A vast number of studies suggest that mastery goals increase motivation more than do performance goals. The general thinking is that mastery oriented individuals seek out challenge and escalate their efforts when tasks become difficult, whereas performance-oriented individuals see their ability as threatened in challenging situations, which they tend to avoid. More recent research, however, suggests that adopting performance goals in some situations may enhance motivation. At times the two goal orientations may go hand in hand (people can strive to attain mastery and outperform others) or the pursuit of performance goals (i.e., comparing one’s self to others) can provide cues that the person is competent and will therefore enhance motivation. It also appears that when performance goals are differentiated by approach (demonstrating ability) and avoidance (concealing low ability) tendencies, it is mainly the avoidance component that compromises sustained achievement strivings.

A related body of research, labeled self-determination theory by Edward Deci and Richard Ryan, conceptualizes achievement goal pursuits in terms of whether they fulfill the individual’s basic needs for competence, autonomy, and relatedness to other people. Goals that satisfy these needs enhance intrinsic motivation. The pioneering research of Deci and Ryan has alerted many educators to the fact that extrinsic rewards, such as grades, gold stars, or even money, can undermine intrinsic motivation if they jeopardize people’s sense of competence and feelings of personal control.

### Future Challenges

Motivation is a rich and changing field that has enjoyed much progress in its relatively brief history. In more than six decades following Hull’s insights, there have been major upheavals in the field (the shift from behaviorism to cognition); new theories and concepts have been introduced, and novel research directions have been pursued (such as the finding that reward can decrease motivation). Principles of motivation have been described that can become the basis for intervention. Quite a bit is known, for example, about the positive motivational consequences of attributing failure to lack of effort rather than low ability, of selecting tasks of intermediate difficulty, and of focusing on mastery rather than outperforming others. All these principles have

good theoretical and empirical grounding. The challenge for the future will be to study motivation in context. Examining achievement expectancy, values, and goals and how they get expressed in the broader context of social and cultural influences might provide important clues for understanding the academic challenges faced by many ethnic minority youth. Addressing such issues will be a useful step toward promoting the field of motivation in education research and assuring its continued vitality.

## INSTRUCTION

The study of motivation has its roots in reinforcement theory, which focuses on the ways behaviors can be shaped by their consequences. In this model, the probability of a given response being repeated in the future is strengthened when it is followed by reward and weakened when it is not—a phenomenon the American psychologist Edward L. Thorndike, author of the 1911 book *Animal Intelligence*, termed the "law of effect." Reinforcement theory, as elaborated by American psychologist B. F. Skinner, exam-

ined the ways in which arbitrary responses could be elicited or eliminated through the use of systematic reinforcement and punishment. Rewards and punishments were thought to affect behavior automatically, without complex cognitive processes. Indeed, most early research was conducted with rats and pigeons, although the underlying principles and processes were thought to operate similarly in people.

### Extrinsic Reformers

Until the 1960s, educators interested in enhancing student motivation were primarily instructed in the use of extrinsic reinforcers to control behavior. Such behavior modification programs, which remain in widespread use in the early twenty-first century, make desired consequences (e.g., rewards, praise, good grades, teacher attention) contingent upon performing specified behaviors (e.g., completing homework, paying attention, remaining quiet). One popular behavior modification technique is the token economy—a system in which students receive tokens each time they exhibit specified behaviors and in which these tokens can be subsequently exchanged for desired goods. Token economies can be extremely effective in producing immediate behavioral changes, and continue to be important techniques for classroom management. At the same time, these techniques have been less effective in producing persistence and generalization of desired behaviors when tangible rewards are no longer available. Thus, despite the obvious benefits of tangible extrinsic reinforcers, several weaknesses of this approach—especially as applied to education—became apparent.

First, although extrinsic contingencies often enhance classroom motivation, this approach ignores the mediating cognitive processes, such as the person's expectations, knowledge, and beliefs, that are essential for understanding when such changes will persist or generalize. Second, *extrinsic* constraints may sometimes conflict directly with children's *intrinsic* motivation to learn, subsequently causing as much harm as good. Third, this approach neglects other significant motivational variables, such as interests, values, and social relationships. Since the 1960s, these limitations of reinforcement theory have served as the impetus for the three broad classes of research reviewed below.

### Mediating Cognitive Processes

Beginning in the 1960s, motivational researchers adopted a more cognitive approach. Rather than

studying only the direct effects of rewards and punishments, researchers became concerned with people's subjective interpretations of these external consequences. Do they expect to be rewarded? Do they expect to succeed? Do they believe their actions will make a difference? Modern researchers believe that people, unlike rats and pigeons, consider whether they are capable of achieving a given goal before they attempt it.

One of the earliest approaches that included these mediating factors was the expectancy-value theory of motivation. This model, which viewed motivation as the multiplicative product of a person's expected probability of success and the expected value of success to that person, proved a significant turning point. Indeed, contemporary theories of motivation consider competence beliefs central to achievement motivation. Researchers have also examined more domain-specific expectancies, such as self-efficacy beliefs—in other words, beliefs that one can achieve specific goals in particular situations—which can promote effort expenditure, persistence in the face of setbacks, and academic performance. People's general theories about the mutability (capacity for change) of intelligence are also important. Compared to theories that intelligence is fixed, theories that intelligence is malleable produce more adaptive behaviors in academic contexts, such as persistence following setbacks and a focus on learning rather than performance.

Expectations for success also depend on attributions regarding past successes and failures. According to attribution theory, individuals characterize causes for success and failure along three dimensions: internal versus external locus (which affects feelings of self-esteem), stability over time (which affects expectations for success in the future), and controllability (which affects emotions such as guilt and shame). These causal attributions are particularly significant when individuals experience failure, and research suggests that attributions of failure to internal, unstable, and controllable causes—such as low effort or a poor strategy—are the most adaptive. Conversely, individuals who attribute failures to stable and uncontrollable causes, such as a lack of aptitude, tend to become helpless and give up, even when they could later easily succeed. Regardless of the presence of rewards, individuals are not motivated to engage in a behavior if they believe they cannot succeed.

Students' beliefs about their abilities and their expectations for success in school can be significantly influenced by teachers' instructional practices. Studies have shown that self-efficacy can be enhanced through direct success experiences, observed successes of a model, and verbal persuasion. One particularly effective procedure is to train students to set proximal (near-term) rather than distal (far-term) goals, which produces both self-efficacy and achievement gains. Teacher expectations can also influence student learning, even when these expectations have no basis in reality, suggesting that teachers convey subtle cues to students that have important consequences for motivation and achievement. Even seemingly innocuous behaviors, such as high praise for easy tasks or unsolicited help giving, can signify that teachers have low expectations and may adversely affect students' beliefs about their own abilities. Students can also be explicitly taught to focus on controllable and unstable causes for failure, such as a lack of effort or a poor strategy. Thus, effective instructional practices should communicate high but realistic expectations for success to students.

### **Intrinsic versus Extrinsic Motives**

Also in the 1960s, researchers began to contrast extrinsic motivation with intrinsic motivation—the desire to engage in activities because they are inherently pleasurable, regardless of external contingencies. Given this contrast, it soon became apparent that extrinsic motivators have the potential to decrease students' subsequent intrinsic motivation when rewards are no longer available. That is, individuals must feel that their behavior is self-determined in order to experience motivation in the absence of extrinsic constraints. Studies have demonstrated that individuals who feel more in control of their own behavior also show more active learning, greater perceived competence, and higher academic achievement.

Conversely, the use of unnecessarily powerful extrinsic rewards can lead individuals to discount their intrinsic motivation. In many studies, students promised and given tangible rewards for engaging in initially intrinsically interesting activities showed less subsequent desire to perform those activities than students given no reward or the same reward unexpectedly. Thus, contracting to perform an activity in order to receive an extrinsic reward may undermine students' intrinsic motivation. Rewards do not al-

ways negatively impact intrinsic motivation, though, and much research has been devoted to understanding when rewards have beneficial versus detrimental effects. For example, rewards tend to enhance motivation when they are unexpected, intangible, and competence enhancing, and when there is little initial interest in an activity. Some controversy remains, however, regarding the specific conditions under which rewards negatively impact motivation.

The overuse of extrinsic incentives may also induce a performance orientation, as opposed to mastery orientation. Individuals with performance goals focus on appearing competent, even at the expense of further learning, whereas individuals with mastery goals focus on learning and understanding, even if their performance temporarily suffers. Research has shown that mastery goals are often associated with many positive achievement behaviors, such as persistence, effort, and effective strategy use. Nonetheless, performance goals may also sometimes be adaptive, and they may even correlate positively with mastery goals. As with intrinsic versus extrinsic motivation, sharp distinctions may be unwarranted.

Teachers can promote intrinsic motivation and foster mastery orientations. When students are encouraged to plan ahead, take personal responsibility, and set individual learning goals, they experience a greater sense of control and show gains in motivation and achievement. Personalizing learning activities or providing individuals with explicit choices can also boost motivation and enhance learning. The judicious use of extrinsic rewards and punishments, just sufficient to elicit compliance, will similarly have particularly positive effects on later intrinsic motivation. A classroom climate that supports mastery orientations—by minimizing public evaluation and normative comparisons, providing opportunities for improvement, and recognizing student effort—should also be beneficial. Instructional practices, therefore, should promote autonomy and minimize unnecessary extrinsic constraints, to foster intrinsic motivation and lifelong learning.

### **Additional Important Factors**

Classic reinforcement theory also neglects other important factors, such as values, interests, and relationships. Values have more recently been viewed as having several components: attainment value (i.e., importance of doing well), interest value (i.e., task enjoyment), utility value (i.e., future usefulness), and cost (i.e., effort). Studies have shown that per-

sonal value of an academic domain can influence course enrollment, effort, persistence, and critical thinking. Closely related to value is interest, which has long been considered an important source of intrinsic motivation. The study of interest has recently received renewed attention, as researchers have sought to understand its relationship to self-regulation and to determine how different forms of interest are related to achievement outcomes.

Relationships are also not addressed by the extrinsic approach, although, much like competence and autonomy, they may be central to intrinsic motivation. Indeed, positive and secure relationships between students and teachers lead to greater classroom engagement, better emotional adjustment to school, and higher valuing of academic activities. It is not only beliefs, but also the more emotional factors of values, interests, and relationships, that can determine students' motivation.

Teachers can support values, interests, and relationships through a variety of instructional practices. Placing curriculum activities in interesting, perhaps even imaginary, contexts (e.g., learning math equations through a computerized space adventure) can produce gains in motivation and learning—provided that the context supports rather than distracts from the curriculum. Another strategy is to select or develop tasks centered on students' existing interests and concerns. This concept has been successfully implemented, both in small cooperative learning groups and in programs designed to create classroom “communities of learners” invested in working together to achieve common goals. Finally, research suggests that positive relationships are fostered when teachers provide appropriate structure and autonomy for their students and show them affection and respect.

### **Individual Differences**

Many of these motivational variables may interact with individual differences, such as need for achievement, locus of control, explanatory styles, and self-theories. For example, stable individual beliefs about whether events are caused by internal versus external factors affect a host of achievement cognitions and behaviors, and different instructional practices may be more appropriate for internals versus externals. Researchers have also examined individual differences in general self-schemas or conceptual frameworks. For example, the extent to which individuals have a theory of intelligence as a malleable quality

versus a fixed entity is thought to account for differences in achievement beliefs, goals, behaviors, and emotions. While it is unrealistic to assume that classroom practices can be perfectly matched to the needs of every individual student, at least given the current structure of most schools, differences in individuals' beliefs and behaviors must be considered, whenever possible.

Finally, motivational theories must include a developmental perspective, particularly when complex cognitive processes are involved. Studies suggest that there are developmental changes in children's beliefs about the relationship between ability and effort and the role that natural ability plays in achievement. Additionally, striking developmental decreases in children's intrinsic motivation and personal valuation of academic activities have been repeatedly documented. Clearly, these findings suggest that current practices have not been fully successful at promoting students' motivation as they progress through school.

## SELF-REGULATED LEARNING

Self-regulated learning refers to the processes by which individual learners attempt to monitor and control their own learning. There are many different models of self-regulated learning that propose different constructs and processes, but they do share some basic assumptions about learning and regulation.

### Assumptions

One common assumption might be called the active, constructive assumption that follows from a general cognitive perspective. That is, all the models view learners as active constructive participants in the learning process. A second, but related, assumption is the potential for control assumption. All the models assume that learners can potentially monitor, control, and regulate certain aspects of their own cognition, motivation, and behavior as well as some features of their environments. This assumption does not mean that individuals will or can monitor and control their cognition, motivation, or behavior at all times or in all contexts, rather just that some monitoring, control, and regulation is possible. All of the models recognize that there are biological, developmental, contextual, and individual difference constraints that can impede or interfere with individual efforts at regulation.

A third general assumption that is made in these models of self-regulated learning is the goal, criterion, or standard assumption. All models of regulation assume that there is some type of criterion or standard (also called goals) against which comparisons are made in order to assess whether the process should continue as is or if some type of change is necessary. The commonsense example is the thermostat operation for the heating and cooling of a house. Once a desired temperature is set (the goal, criterion, or standard), the thermostat monitors the temperature of the house (monitoring process) and then turns on or off the heating or air conditioning units (control and regulation processes) in order to reach and maintain the standard. In a parallel manner, the general example for learning assumes that individuals can set standards or goals to strive for in their learning, monitor their progress toward these goals, and then adapt and regulate their cognition, motivation, and behavior in order to reach their goals.

A fourth general assumption of most of the models of self-regulated learning is that self-regulatory activities are mediators between personal and contextual characteristics and actual achievement or performance. That is, it is not just individuals' cultural, demographic, or personality characteristics that influence achievement and learning directly, nor just the contextual characteristics of the classroom environment that shape achievement, but the individuals' self-regulation processes that mediate the relations between the person, context, and eventual achievement. Most models of self-regulation assume that self-regulatory activities are directly linked to outcomes such as achievement and performance, although much of the research examines self-regulatory processes as outcomes in their own right.

### **Domains of Self-Regulation**

Given these assumptions, a general working definition of self-regulated learning is that it is an active, constructive process whereby learners set goals for their learning and then attempt to monitor, regulate, and control their cognition, motivation, and behavior, guided and constrained by their goals and the contextual features in the environment. Following this general definition, research on models of self-regulated learning have delineated four general domains that learners can try to self-regulate: (1) cognition, (2) motivation, (3) behavior, and (4) the environment.

The cognitive domain includes the various cognitive strategies that learners can use to help them remember, understand, reason, and problem solve. Much of the work in this domain has focused on the learning strategies that students can use in academic contexts to comprehend text, to learn from lectures, to take notes, to solve math problems, to write papers, (e.g., testing their comprehension as they read a text). In addition, research has focused on metacognitive strategies that learners can use to plan, monitor, and control their own cognition. In many ways, metacognition is now seen as one part of the more general construct of self-regulated learning. In general, good self-regulating learners use a number of different strategies to control their cognition in ways that help them reach their goals.

The motivation and affective domain includes the various strategies that individuals can use to try to control and regulate their own motivation and emotions. This can include strategies for boosting their self-confidence or self-efficacy such as positive self-talk ("I know I can do this task") as well as strategies to try to control their interest (e.g., making the task more interesting by making a game out of it). Other strategies can be aimed at controlling negative emotions such as anxiety that can interfere with learning. In some research, these motivational and emotional control strategies are called volitional control strategies, but they can also be seen as part of the larger construct of self-regulated learning. As with cognition, good self-regulating learners do attempt to control their motivation and emotions in order to facilitate attainment of their goals.

The third domain includes actual attempts to control overt behavior, not just internal cognitions or motivational beliefs and emotions. This could involve increasing or decreasing effort on a task, as well as persisting on a task or giving up. Help-seeking behavior is another important self-regulatory behavior. Good self-regulators would adjust their effort levels to the task and their goals; they know when to persist, when to ask for help, and when to stop doing the task.

Finally, self-regulated learners can attempt to monitor and control the environment. Of course, they will not have as much control over the general classroom context or academic tasks as they do over their own cognition, motivation, and behavior, but there are some aspects of the context that can be controlled. For example, good self-regulated learners will try to control distractions by asking others to be

quiet or by moving to another location. Good self-regulators also try to understand the task demands and the classroom norms and then try to adjust their learning to fit these demands. In other words, they are sensitive to the contextual demands and constraints that are operating in the classroom and attempt to cope with them in an adaptive manner.

### The Development of Self-Regulation

There are a host of factors that can influence the development of self-regulation; three are noted here: cognitive development, motivation, and classroom contexts. Given the complexity of self-regulated learning, it is a phenomenon that emerges later in a child's life. There are clear developmental and maturational constraints on self-regulated learning. Although there are obviously aspects of self-regulation in place by the time a young child reaches school, the development of self-regulation for academic tasks takes place over the course of K–12 education. There is not as much research on the development of self-regulated learning as there is on how it operates, but it is probably not until the middle to late elementary school grades (third grade to sixth grade) that students begin to develop some of the important self-regulation strategies. In fact, it is likely that much of the development of self-regulated learning takes place in adolescence, given general cognitive developmental changes as well as the changes in the classroom context in middle schools and high schools. At the same time, there are many students who do not develop self-regulated strategies at all, even some of those more successful ones who go on to college. Accordingly, there is a need to develop explicit instructional strategies and programs to help students learn about self-regulation and develop expertise in regulating their learning.

Self-regulated learning is also time-consuming and quite difficult for some students, even when provided with explicit instruction in self-regulation. Accordingly, it is important that students are motivated to be self-regulating. Research of Paul R. Pintrich (1999) on the role of motivation in self-regulated learning has suggested three important generalizations about the relations between motivation and self-regulated learning. First, students must feel self-efficacious or confident that they can do the tasks. If they feel they can accomplish the academic tasks, then they are much more likely to use various self-regulation strategies. Second, students must be interested in and value the classroom tasks. Students

who are bored or do not find the tasks useful or worthwhile are much less likely to be self-regulating than those who are interested and find the tasks important. Finally, students who are focused on goals of learning, understanding, and self-improvement are much more likely to be self-regulating than students who are pursuing other goals such as trying to look smarter than others, or trying not to look stupid. These generalizations have been found in a large number of studies and seem to be fairly robust, but of course there is a need for more research on the role of motivation in self-regulated learning.

Finally, besides developmental and motivational factors, there are contextual factors that play a role in the development of self-regulation. One of the most important is that individuals actually have the opportunity to try to take control of their own learning and are given the chance to try tasks on their own. Of course, it is important that tasks are not too challenging or too easy, but in the students' range of competence. In addition, the modeling and demonstration of various self-regulatory strategies by parents, teachers, and peers can help students learn these strategies. Students also need the opportunity to have guided practice with the use of these strategies, with support and guidance from knowledgeable others, whether they be parents, teachers, or peers. Finally, there should be incentives in the context for the use of these strategies, such that students who are successful in using the strategies are rewarded in terms of praise or more tangible rewards such as better learning and achievement.

### Importance of Self-Regulated Learning

In summary, self-regulated learning is an important aspect of learning and achievement in academic contexts. Students who are self-regulating are much more likely to be successful in school, to learn more, and to achieve at higher levels. Accordingly, it is important for schools and classrooms to attempt to foster the development of expertise in self-regulated learning. Of course, there are developmental, motivational, and contextual factors that can facilitate or constrain self-regulated learning, but there are implicit and explicit ways to help foster self-regulated learning. In the twenty-first century and as the explosion of information and multiple ways of learning increase, it will become even more important that individuals know how to self-regulate their learning and that fostering self-regulated learning becomes an important goal for all educational systems.

## MOTOR LEARNING

Human beings use movement to learn about their world, to function in the world as they grow and mature, and to maintain healthy bodies. Individuals must learn to move and at the same time move to learn. Children explore their worlds through movement and make fundamental links between action and reality through movement.

The scientific study and principles that undergird motor learning provide the guidance and an un-

FIGURE 1

derlying framework for (1) curricula of physical education programs within schools; (2) the co-curricular sport programs; (3) the pedagogical principles applied by physical education teachers and coaches; and (4) the clinical interventions of occupational and physical therapists for individuals of all ages. Professionals who understand how children and youth acquire motor skills, whether building with blocks, learning to write or draw, effectively moving through space, or developing skills for sport or leisure activities, enhance their capacity to provide optimal learning experiences.

Understanding how individuals learn motor skills (motor learning) requires an appreciation for the following factors.

- Motor Development: how the capacity of children to produce motor skills naturally matures
- Motor Control: how the human neurological system controls movement
- Sport Psychology: how to motivate individuals to want to learn motor skills and participate in sport and exercise
- Pedagogy for Physical Education: how the learning environment can be organized to optimize the acquisition of motor skills

Motor learning focuses on the most effective ways to facilitate the acquisition of skills by understanding or manipulating three aspects of the learning process for motor skills, as illustrated in Figure 1.

Motor learning research has held a predominant place in both physical education and psychology for more than 100 years. The early work of Robert Woodworth (1899) examined the conditions that af-

fect movement accuracy and began a long history of research in this area. In the early twenty-first century, two fundamental approaches (models) describe the acquisition of motor skills and the challenges that face the learner. The information-processing focus is grounded by the work of such researchers as James Adams (1971), Steven Keele (1968) and Richard Schmidt (1975). An alternative explanation of motor skill acquisition comes from a dynamical systems approach followed by Karl Newell (1991) and Walter, Lee, and Sternad (1998). This approach emphasizes self-organization as a function of specific control parameters and environmental conditions as a way to understanding motor behavior.

### Motor Learning Research Informs Professional Practice

Research from motor learning focuses on understanding how individuals acquire and perform motor skills, and serves as the basis for informed practice in such professional fields as physical education, occupation therapy, sports medicine, and physical therapy. In order to illustrate the contributions of motor learning to professional practice, three examples have been selected.

**Providing effective models/demonstrations.** Historically it was believed that providing ideal models was the best way to transmit information to learners. This assumption suggested that teachers or professional models should provide demonstrations to facilitate the acquisition of motor skills. By the early twenty-first century, research had shown that providing “learning models” who are similar to the peer learners, and who are shown modifying their skills, are more effective than the traditional perfect model. In practice, this suggests that models who are individuals, similar to the learner, should be shown trying to learn a motor skill, receiving feedback, and improving as a result of this feedback. Teachers should therefore focus on selecting classmate children to model, and to provide feedback that allows the models to improve during the process of providing the demonstration.

**Practice variability (contextual interference).** Learning environments that provide reinforcement for the immediate performance of desired skills has often been the focus of physical education programs. The short-term benefits of practice that result do not take into account the need to consider the long-term benefits of various practice strategies.

For example, if students are to learn three tennis skills (forehand, backhand, and serve), they typically practice in a blocked fashion, focusing exclusively on each skill until it is learned (often to the 80 percent proficiency level). In contrast, early-twenty-first-century motor learning research has shown that practicing such skills in an interleaved or random fashion produces better long-term retention. This principle is referred to as *contextual interference* since practicing each of the three skills together produces some short-term interference (degradation of performance) compared to blocked practice, though eventually learners will be able to retain each skill at a level higher than those individuals who practice in a blocked schedule.

**Brain gym.** The provision of physical education in K-12 schools, and work in allied health professions (physical therapy, sports medicine, etc.) has relied on the scientific bases from a variety of disciplines (e.g., kinesiology, neurology, physical education, physical therapy, and psychology). By the twenty-first century, a resurgence of interest occurred in the neurological foundations of motor performance and in how the neurological system integrates cognitive and motor skills. One predominant influence has been the neuro-physiological bases of motor skill acquisition, and a curricular interpretation referred to as *brain gym*. The work of Paul Dennison and Gail Dennison (1994) has focused on the importance of inter-hemispheric activation, systematic challenges, and the use of cognitive resources in the production of motor skills.

In summary, the field of motor learning provides the understanding of the psychological and physiological features that enhance motor skill acquisition. It informs professional practice for both classroom and physical education teachers, and for allied health professionals, and impacts the quality of life for all individuals (birth through death).

## MULTICULTURAL EDUCATION

Multicultural education is an idea, an approach to school reform, and a movement for equity, social

justice, and democracy. Specialists within multicultural education emphasize different components and cultural groups. However, a significant degree of consensus exists within the field regarding its major principles, concepts, and goals. A major goal of multicultural education is to restructure schools so that all students acquire the knowledge, attitudes, and skills needed to function in an ethnically and racially diverse nation and world. Multicultural education seeks to ensure educational equity for members of diverse racial, ethnic, cultural, and socioeconomic groups, and to facilitate their participation as critical and reflective citizens in an inclusive national civic culture.

Multicultural education tries to provide students with educational experiences that enable them to maintain commitments to their community cultures as well as acquire the knowledge, skills, and cultural capital needed to function in the national civic culture and community. Multicultural theorists view academic knowledge and skills as necessary but not sufficient for functioning in a diverse nation and world. They regard skills in democratic living and the ability to function effectively within and across diverse groups as essential goals of schooling.

Multicultural education is highly consistent with the ideals embodied in the U.S. Constitution, the Declaration of Independence, and the Bill of Rights. It seeks to extend the rights and privileges granted to the nation's founding elites—the ideals of freedom, equality, justice, and democracy—to all social, cultural and language groups. Multicultural education addresses deep and persistent social divisions across various groups, and seeks to create an inclusive and transformed mainstream society. Multicultural educators view cultural difference as a national strength and resource rather than as a problem to be overcome through assimilation.

### History

Multicultural education emerged during the civil rights movement of the 1960s and 1970s. It grew out of the demands of ethnic groups for inclusion in the curricula of schools, colleges, and universities. Although multicultural education is an outgrowth of the ethnic studies movement of the 1960s, it has deep historical roots in the African-American ethnic studies movement that emerged in the late nineteenth and early twentieth centuries.

Initiated by scholars such as George Washington Williams, Carter G. Woodson, W. E. B. DuBois,

and Charles H. Wesley, the primary goal of the early ethnic studies movement was to challenge the negative images and stereotypes of African Americans prevalent in mainstream scholarship by creating accurate descriptions of the life, history, and contributions of African Americans. These scholars had a personal, professional, and enduring commitment to the uplift of African Americans. They believed that creating positive self-images of African Americans was essential to their collective identity and liberation. They also believed that stereotypes and negative beliefs about African Americans could be effectively challenged by objective historical research that was also capable of transforming mainstream academic knowledge.

Carter G. Woodson—one of the leading scholars of the early ethnic studies movement—helped found the Association for the Study of Negro (now Afro-American) Life and History in 1915. The association played a key role in the production and dissemination of African-American historical scholarship. In addition to writing numerous scholarly works and editing the association's publications, Woodson initiated Negro History Week (now Black History Month) to focus attention in the nation's schools on the life and history of African Americans.

In 1922 Woodson published a college textbook, *The Negro in Our History*, which was used in many African-American schools and colleges. In response to public demand for classroom materials, he wrote an elementary textbook, *Negro Makers of History*, followed by *The Story of the Negro Retold* for senior high schools. Woodson also wrote, edited, and published African-American children's literature. In 1937 he began publication of *The Negro History Bulletin*, a monthly magazine for teachers and students featuring stories about exemplary teachers and curriculum projects, historical narratives, and biographical sketches.

When the ethnic studies movement was revived in the 1960s, African Americans and other marginalized ethnic groups refused assimilationist demands to renounce their cultural identity and heritage. They insisted that their lives and histories be included in the curriculum of schools, colleges, and universities. In challenging the dominant paradigms and concepts taught in the schools and colleges, multicultural educators sought to transform the Eurocentric perspective and incorporate multiple perspectives into the curriculum.

By the late 1980s multicultural theorists recognized that ethnic studies was insufficient to bring about school reforms capable of responding to the academic needs of students of color. They consequently shifted their focus from the mere inclusion of ethnic content to deep structural changes in schools. During these years, multicultural educators also expanded from a primary focus on ethnic groups of color to other group categories, such as social class, language and gender. Although conceptually distinct, the key social categories of multicultural education—race, class, gender, and culture—are interrelated. Multicultural theorists are concerned with how these social variables interact in identity formation, and about the consequences of multiple and contextual identities for teaching and learning.

During the 1970s a number of professional organizations—such as the National Council for Social Studies, the National Council of Teachers of English, and the American Association of Colleges for Teacher Education—issued policy statements and publications that encouraged the integration of ethnic content into the school and teacher education curriculum. In 1973 the title of the forty-third yearbook of the National Council for the Social Studies (NCSS) was *Teaching Ethnic Studies: Concepts and Strategies*. NCSS published *Curriculum Guidelines for Multiethnic Education* in 1976, which was revised and reissued in 1992 as *Curriculum Guidelines for Multicultural Education*. A turning point in the development of multicultural education occurred in 1977 when the National Council for the Accreditation of Teacher Education (NCATE) issued standards for the accreditation of teacher education. The standards required all NCATE member institutions (about 80% of the teacher education programs in the United States) to implement components, courses, and programs in multicultural education.

Over the past two decades more ethnic content has appeared in the textbooks used in elementary and secondary schools in the United States. An increasing number of teachers are using anthologies in literature programs that include selections written by women and authors of color. In addition, the market for books dealing with multicultural education has grown substantially, and some of the nation's leading colleges and universities, including the University of California at Berkeley and the University of Minnesota, have either revised their core curriculum to include ethnic content or have established ethnic studies course requirements.

## The Dimensions of Multicultural Education

James A. Banks's *Dimensions of Multicultural Education* is used widely by school districts to conceptualize and develop courses, programs, and projects in multicultural education. The five dimensions are: (1) content integration; (2) the knowledge construction process; (3) prejudice reduction; (4) an equity pedagogy; and (5) an empowering school culture and social structure. Although each dimension is conceptually distinct, in practice they overlap and are interrelated.

**Content integration.** Content integration deals with the extent to which teachers use examples and content from a variety of cultures and groups to illustrate key concepts, principles, generalizations, and theories in their subject area or discipline. The infusion of ethnic and cultural content into a subject area is logical and not contrived when this dimension is implemented properly.

More opportunities exist for the integration of ethnic and cultural content in some subject areas than in others. There are frequent and ample opportunities for teachers to use ethnic and cultural content to illustrate concepts, themes, and principles in the social studies, the language arts, and in music. Opportunities also exist to integrate multicultural content into math and science. However, they are less ample than they are in social studies and the language arts. Content integration is frequently mistaken by school practitioners as comprising the whole of multicultural education, and is thus viewed as irrelevant to instruction in disciplines such as math and science.

**The knowledge construction process.** The knowledge construction process describes teaching activities that help students to understand, investigate, and determine how the implicit cultural assumptions, frames of references, perspectives, and biases of researchers and textbook writers influence the ways in which knowledge is constructed.

Multicultural teaching involves not only infusing ethnic content into the school curriculum, but changing the structure and organization of school knowledge. It also includes changing the ways in which teachers and students view and interact with knowledge, helping them to become knowledge producers, not merely the consumers of knowledge produced by others.

The knowledge construction process helps teachers and students to understand why the cultural

identities and social positions of researchers need to be taken into account when assessing the validity of knowledge claims. Multicultural theories assert that the values, personal histories, attitudes, and beliefs of researchers cannot be separated from the knowledge they create. They consequently reject positivist claims of disinterested and distancing knowledge production. They also reject the possibility of creating knowledge that is not influenced by the cultural assumptions and social position of the knowledge producer.

In multicultural teaching and learning, paradigms, themes, and concepts that exclude or distort the life experiences, histories, and contributions of marginalized groups are challenged. Multicultural pedagogy seeks to reconceptualize and expand the Western canon, to make it more representative and inclusive of the nation's diversity, and to reshape the frames of references, perspectives, and concepts that make up school knowledge.

**Prejudice reduction.** The prejudice reduction dimension of multicultural education seeks to help students develop positive and democratic racial attitudes. It also helps students to understand how ethnic identity is influenced by the context of schooling and the attitudes and beliefs of dominant social groups. The theory developed by Gordon Allport (1954) has significantly influenced research and theory in intergroup relations. He hypothesized that prejudice can be reduced by interracial contact if the contact situations have these characteristics: (1) they are cooperative rather than competitive; (2) the individuals experience equal status; and (3) the contact is sanctioned by authorities such as parents, principals and teachers.

**An equity pedagogy.** An equity pedagogy exists when teachers modify their teaching in ways that will facilitate the academic achievement of students from diverse racial, cultural, socioeconomic, and language groups. This includes using a variety of teaching styles and approaches that are consistent with the range of learning styles within various cultural and ethnic groups, such as being demanding but highly personalized when working with American Indian and Native Alaskan students. It also includes using cooperative learning techniques in math and science instruction to enhance the academic achievement of students of color.

An equity pedagogy rejects the cultural deprivation paradigm that was developed in the early 1960s.

This paradigm posited that the socialization experiences in the home and community of low-income students prevented them from attaining the knowledge, skills, and attitudes needed for academic success. Because the cultural practices of low-income students were viewed as inadequate and inferior, cultural deprivation theorists focused on changing student behavior so that it aligned more closely with mainstream school culture. An equity pedagogy assumes that students from diverse cultures and groups come to school with many strengths.

Multicultural theorists describe how cultural identity, communicative styles, and the social expectations of students from marginalized ethnic and racial groups often conflict with the values, beliefs, and cultural assumptions of teachers. The middle-class mainstream culture of the schools creates a cultural dissonance and disconnect that privileges students who have internalized the school's cultural codes and communication styles.

Teachers practice culturally responsive teaching when an equity pedagogy is implemented. They use instructional materials and practices that incorporate important aspects of the family and community culture of their students. Culturally responsive teachers also use the “cultural knowledge, prior experiences, frames of reference, and performance styles of ethnically diverse students to make learning encounters more relevant to and effective for them” (Gay, p. 29).

**An empowering school culture.** This dimension involves restructuring the culture and organization of the school so that students from diverse racial, ethnic, socioeconomic, and language groups experience equality. Members of the school staff examine and change the culture and social structure of the school. Grouping and labeling practices, sports participation, gaps in achievement among groups, different rates of enrollment in gifted and special education programs among groups, and the interaction of the staff and students across ethnic and racial lines are important variables that are examined and reformed.

An empowering school structure requires the creation of qualitatively different relationships among various groups within schools. Relationships are based on mutual and reciprocal respect for cultural differences that are reflected in school-wide goals, norms, and cultural practices. An empowering school structure facilitates the practice of multicul-

tural education by providing teachers with opportunities for collective planning and instruction, and by creating democratic structures that give teachers, parents, and school staff shared responsibility for school governance.

### **Evidence of the Effectiveness of Multicultural Education**

*The Handbook of Research of Multicultural Education* comprehensively reviews the research on multicultural education and the effectiveness of various kinds of multicultural curricular interventions. At least three categories of research that describe the effectiveness of multicultural education can be identified: (1) research that describes the effectiveness of multicultural curriculum interventions such as Banks's 2001 research review; (2) research on the effects of cooperative learning and interracial contact, such as Robert Slavin's 2001 research review; and (3) research on how culturally responsive teaching influences student learning, such as Carol Lee's 1993 study and Gloria Ladson-Billings's 2001 work. An extended discussion of studies in the first genre is presented in this entry. Research reviews of the other two genres are found in the *Handbook of Research on Multicultural Education*.

Slavin's 2001 research review and Cohen and Lotan's 1995 research on cooperative learning and interracial contact activities indicate that these interventions—if they are consistent with Allport's theory of intergroup contact—help students to develop more positive racial attitudes, to make more cross-racial friendships, and have positive effects on the academic achievement of Latino and African-American students. Lee's 1993 research on culturally responsive teaching indicates that when teachers use the cultural characteristics of students in their teaching the academic achievement of students from diverse groups can be enhanced.

**Research on curriculum materials and interventions.** Research indicates that the use of multicultural textbooks, other teaching materials, television, and simulations can help students from different racial and ethnic groups to develop more democratic racial attitudes and perceptions of other groups. Since the 1940s a number of curriculum interventions studies have been conducted to determine the effects of teaching units and lessons, multicultural textbooks and materials, role playing, and simulation on the racial attitudes and perceptions of students.

These studies provide guidelines that can help teachers to improve intergroup relations in their classrooms and schools. One of the earliest curriculum studies was conducted by Helen Trager and Marion Yarrow (1952). They found that a democratic, multicultural curriculum had positive effects on the racial attitudes of teachers and on those of first- and second-grade students. John Litcher and David Johnson (1969) found that white, second-grade children developed more positive racial attitudes after using multiethnic readers. Gerry Bogatz and Samuel Ball (1971) found that *Sesame Street*, PBS's multicultural television program, had a positive effect on the racial attitudes of children who watched it for long periods. In a study by Michael Weiner and Frances Wright (1973), children who themselves experienced discrimination in a simulation developed less prejudiced beliefs and attitudes toward others. Multicultural social studies materials and related experiences had a positive effect on the racial attitudes of African-American four-year-old children in a study conducted by Thomas Yawkey and Jacqueline Blackwell (1974).

Research indicates that curriculum interventions such as plays, folk dances, music, role playing, and simulations can have positive effects on the racial attitudes of students. A curriculum intervention that consisted of folk dances, music, crafts, and role playing positively influenced the racial attitudes of elementary students in a study conducted by M. Ahmed Ijaz and I. Helene Ijaz (1981). Four plays about African Americans, Chinese Americans, Jews, and Puerto Ricans increased racial acceptance and cultural knowledge among fourth-, fifth-, and sixth-grade students in a study conducted by Beverly Gimestad and Edith DeChiara (1982).

Josette McGregor (1993) used meta-analysis to integrate findings and to examine the effects of role playing and antiracist teaching on reducing prejudice in students. Twenty-six studies were located and examined. McGregor concluded that role playing and antiracist teaching "significantly reduce racial prejudice, and do not differ from each other in their effectiveness" (p. 215).

### Demographic Trends and Issues

The ethnic, cultural, and language diversity within the United States and its schools is increasing. The U.S. Bureau of the Census projects that 47 percent of the U.S. population will consist of ethnic groups of color by 2050. Between 1991 and 1998, 7.6 million

immigrants entered the United States, mostly from nations in Asia and Latin America. The U.S. Census estimates that more than one million immigrants will enter the United States every year for the foreseeable future. Thirty-five percent of students enrolled in U.S. schools in 1995 were students of color. If current demographic trends continue, students of color will comprise approximately 46 percent of the student population in 2020. The increasing ethnic and cultural diversity of the U.S. student population stands in sharp contrast to a teaching force that was 90.7 percent white, middle-class, and three-fourths female in 1996. Many of the students entering U.S. schools speak a first language other than English. The 1990 census indicated that 14 percent of the nation's school-age youth lived in homes where the primary language was not English.

In addition to increasing ethnic, language, and cultural diversity, a significant and growing percentage of children in the United States, especially children of color, are being raised in poverty. The number of children living in poverty rose from 16.2 percent in 1979 to 18.7 percent in 1998. According to the U.S. Census Bureau, of the 12.7 percent of the United States population living in poverty in 1997, 8.6 percent were non-Hispanic whites, 26.0 percent African Americans, and 27.1 percent Hispanics.

Multicultural education theorists believe that the nation's schools should respond to its increasing racial, ethnic, and language diversity. However, they have different views about how to define the field's boundaries and about which social groups should be included under its umbrella. Some theorists are concerned that as the field expands to include an increasing number of cultural groups, its initial focus on institutionalized racism and the achievement of students of color might wane. The discussions and debates within multicultural education reflect the vitality and growth of an emerging discipline.

An increasingly low-income and linguistically and culturally diverse student population requires a transformation of the deep structure of schooling in order to experience educational equity and cultural empowerment in the nation's schools. Multicultural education is a process of comprehensive school reform that challenges racism and prejudice by transforming the curriculum and instructional practices of schools, and by changing the relationships among teachers, students, and parents.

A major goal of multicultural education is to help students from diverse cultures learn how to

transcend cultural borders and to engage in dialog and civic action in a diverse, democratic society. Multicultural education tries to actualize cultural democracy, and to include the dreams, hopes, and experiences of diverse groups in school knowledge and in a reconstructed and inclusive national identity. The future of democracy in the United States depends on the willingness and ability of citizens to function within and across cultures. The schools can play a major role in helping students to develop the knowledge and skills needed to cross cultural borders and to perpetuate a democratic and just society.

## MULTICULTURALISM IN HIGHER EDUCATION

There have always been debates about what knowledge should be included in the general education

curriculum (often referred to as the *core curriculum*). However, since the mid-1960s the debate has focused largely on the inclusion of racial, ethnic, women, gay, and lesbian voices in the curriculum. At the beginning of the twenty-first century, the debate is not whether to do it, but how. Although many terms over the years have been used, such as *multiculturalism*, *multicultural education*, and *ethnic studies*, the term *diversity* will be used here. A more encompassing term, *diversity* is meant to represent all perspectives from groups that have traditionally been excluded from or insufficiently examined in the curriculum. The term also takes into account the external forces that influence how academic institutions meet their educational objectives. The legal struggle over affirmative action in admissions, for example, no longer rests on moral grounds of remedy for past discrimination, but on the compelling interest of the state in the educational value of having a diverse student body.

### Demographics and Debates About Inclusion

Since the end of World War II, U. S. colleges and universities have become increasingly more diverse (by social class, race, gender, ethnicity, age, sexual orientation, and people with disabilities), even though some of these changes have often been fiercely resisted. Some demographic changes occurred not simply because of federal troops but also because of federal legislation. In the 1940s the G. I. Bill made college affordable for vast numbers of working-class men. The Civil Rights Act of 1964 opened the door of academia to African Americans and other people of color, while the Immigration Act of 1965 opened U.S. borders to new sections of the globe. Title IX radically altered how women fared on campuses, just as the Americans with Disabilities Act of 1990 removed barriers that previously barred many aspiring students. Other demographic shifts were fueled by policy changes or new programs, such as the establishment of community college systems, the creation of programs of continuing education for women, and the creation of the Equal Opportunities Commission. By the end of the twentieth century higher education had actually come close to fulfilling democracy's highest goal of an educated citizenry. In 2000 nearly 75 percent of high school graduates went on to some college experience within two years of graduating. The student profile in the late 1990s was 55 percent female and 28 percent students of color. Forty-three percent of stu-

dents were over 25 years old, and nearly that same percentage were first generation college students.

Paralleling the shifting demographics of the students was the persistent call for inclusion of diverse perspectives in the curriculum. These calls have come not only from the groups that were previously excluded, but also from faculty, students, business leaders, and the general public. In a public poll of registered voters in 1998, the ordinary citizen was overwhelmingly in favor of diversifying students, faculty, and the courses taught. While 58 percent were concerned that the United States was splitting apart over differences, 71 percent believed that higher education could, and should, help people find a way to bring people together. Although Americans might differ in their rationales for broader inclusion, there is consensus overall about the intellectual, individual, economic, and societal benefits for doing so.

Calls for inclusion stem from the argument that a singular, Eurocentric perspective has had negative consequences for individual students and for the larger society. Proponents of diversity in higher education argue that excluding diverse perspectives in the curriculum has truncated students' learning, leaving them ill-prepared to function in an increasingly diverse democracy. The very purpose of higher education—to deepen students' understanding of what is known, how it has come to be known, and how to build on previous knowledge to create new knowledge—is thus undermined by eliminating the voices of those whose experiences differ from those traditionally represented. Such exclusions reveal an inconsistency between the rhetoric and the practice of democracy. Correcting this inconsistency eventually became the cornerstone of the civil rights, women's rights, and other movements that have pushed the higher education community to offer a more inclusive curriculum.

Conversely, opponents of diversity in the curriculum argue against including African American, Latina/Latino, Chicano, Asian American, women's, and gay and lesbian studies in the higher education curriculum, claiming that these issues are more appropriately discussed and debated in the political arena rather than in academia. They contend that institutions of higher education should be reserved for the pursuit of objective knowledge and truth through rigorous disciplinary study. Critics of diversity education claim that the focus on differences, which is often a characteristic of general-education

diversity requirements, weakens national unity and has only a limited (if any) role in institutions of higher learning. They contend that the curriculum of higher education should be the basis for inquiry, discovery, and dissemination of knowledge, open to students capable of contributing to its development, and devoid of social politics.

As the debate about inclusion grew louder, the research on, and practice of, diversity education has accelerated greatly over the years. Initially, diversity in the 1960s and 1970s was located primarily in newly established special departments and programs, usually organized around a single group, such as Asian-American studies, women's studies, or African-American studies. By the 1980s these specialized areas of knowledge eventually spawned hundreds of programs at colleges and universities in what came to be called *mainstreaming*, *integrating*, or *transforming* the curriculum. Such programs sought to incorporate new knowledge into existing courses, some of which were within a major course of study, others of which were in general education courses.

Eventually, the research on multicultural education began to lay out a compelling case that being attentive to diverse voices provides lenses through which richer conceptions of social, political, economic, and natural phenomenon could be revealed, underscoring that there are many ways of knowing. During the 1980s and 1990s in particular, colleges and universities moved from infusing diversity across the curriculum to also creating diversity requirements within their core curriculum. While a general education requirement alone is insufficient in and of itself to prepare students for the complexity of the diverse societies they will work and live in, it is a solid and significant start.

Before examining the emerging contours of twenty-first-century diversity requirements, it is important to recognize their context within general education as a whole. Some institutions, such as Wesleyan University in Connecticut, Bloomfield College in New Jersey, and Brookdale Community College in New Jersey, have invested significant institutional funds over many years in what they argue is a more pervasive strategy of infusion across the curriculum, rather than relying on a single required diversity course in general education. Nonetheless, because students take a prescribed number of general education courses, lodging diversity within core requirements is one visible indicator of an institution's commitment to diversity. While it is not the

only measure, or even a sufficient measure, embedding diversity within general education makes a clear statement that knowledge about diversity is viewed as an essential component of a college education.

### **An Aerial View of National Diversity Requirements**

The first formal adoption of a diversity requirement in the general education core occurred at Denison University in Ohio in 1979. By 1992, however, a survey conducted by researchers Richard Light and Jeanette Cureton reported that 34 percent of colleges and universities had multicultural general education requirements, 12 percent of which were on domestic diversity; 29 percent on global diversity; and 57 percent addressing both. Of those colleges queried, one-third offered course work in ethnic and women's studies, while a far greater number—54 percent—had introduced multiculturalism into their departmental course offerings. It is not surprising that there is more activity at departmental levels than at general education levels, since, in most cases, general education needs majority support from the faculty to secure approval. But departmental activity is unevenly dispersed and some departments and divisions have almost no multicultural courses or requirements.

Light and Cureton also found that four-year colleges are more active than two-year colleges in integrating multiculturalism into the curriculum, despite the greater diversity of the student body in community colleges. While demographics clearly drive the push for diversity requirements and courses, they are, it seems, not the only factor. Public institutions exceed private colleges in the number of multicultural indicators, just as research universities have more comprehensive multicultural efforts than either comprehensives or liberal arts colleges. Not surprisingly, geographical regions varied significantly in the amount of multicultural programming, with the Mid-Atlantic states and the West outpacing New England and the South.

In a 2000 national survey about diversity requirements, the Association of American Colleges and Universities (AAC&U) found striking progress among the percentage of colleges and universities polled—the number of institutions with diversity requirements had almost doubled from Light and Cureton's figures in 1992. Sixty-three percent of colleges and universities reported either having a diversity requirement in place or being in the process of

developing one. Fifty-four percent of survey respondents had diversity requirements in place; another 8 percent were in the process of establishing them. Of institutions with requirements, 25 percent had been in place for more than ten years, 45 percent had put them in place during the previous five to ten years, and 30 percent had requirements in place for less than five years. All indications are, therefore, that the number of colleges with diversity requirements is likely to continue to expand.

Regional distinctions were also found in AAC&U's survey. For example, 78 percent of colleges responding from the West had diversity requirements, while 68 percent of those in the Middle States (Mid-Atlantic) region and 60 percent in the North Central region had such requirements. By contrast, only 45 percent of the institutions in the New England region had diversity requirements in 2000, followed by 36 percent of those in the South and 35 percent in the Northwest.

### **Incorporating Diversity into General Education Designs**

But what do diversity requirements look like? A majority (58 percent) of institutions with such requirements demand that students take one course; while 42 percent require two or more courses. Not surprisingly, the most common model, surfacing at 68 percent of the AAC&U survey respondents, asks students to take one diversity course among many offerings. Typically these courses examine attitudes and cultures that are different from the dominant culture. At the University of Arizona, students can take a class that focuses on gender, race, class, or ethnicity, while the requirement at the University of Maryland focuses on all those plus non-Western culture as well.

Some institutions include several courses, but more restrictively define their purpose. At the University of Michigan, for instance, while there are many different courses to choose from, each course needs to pay attention to (1) race, racism, and ethnicity; (2) intolerance and resulting inequality; and (3) comparisons across race, religion, ethnicity, religion, social class, or gender. Similarly, Denison University in Ohio, whose requirement dates back to 1979, requires a course on women and/or minorities in twentieth century America that examines the effects of discrimination in the American context. Haverford College in Pennsylvania, whose original 1983 diversity requirement asked that students be

introduced either to cultures they did not know or to systems of inequality and discrimination, revised its requirement after ten years to a social justice requirement focused on analyzing systems of inequality and discrimination.

The advantage of a more flexible diversity requirement is that it creates fewer turf battles between departments, is more easily approved by curriculum committees, and often needs less faculty development because the people who already have the expertise in a given area submit their existing courses as possible choices for the diversity requirement. These broad diversity requirements typically involve people across disciplines. When paired with faculty development opportunities, as it is at the University of Maryland, they can be a significant source for change in the curriculum overall, since newly acquired faculty expertise and perspectives will extend beyond the approved general-education diversity courses. The disadvantage of this approach is that without more tightly defined learning goals for the students, it is not always clear exactly what knowledge the institutions want students to acquire from taking such wide-ranging diversity courses. Students taking a course in twelfth-century Chinese art, for example, will learn very different things than those taking a course on the U.S. civil rights movement.

By contrast, only 17 percent of respondents in AAC&U's survey require all students to take a single diversity course that is part of a more tightly defined core curriculum. The great advantage of required cores is that every student is introduced to diversity issues, regardless of their major. Implementing a core curriculum, especially a newly designed one, typically calls for offering faculty development opportunities, which will, as a by-product, result in widespread influence on the content and pedagogy of many other courses outside the core.

Having a required core curriculum seems to work more easily and effectively at smaller institutions, for obvious staffing reason, but there are examples of large research universities implementing core curricula as well. The State University of New York at Buffalo, with approximately 16,000 undergraduate students, has such a core curriculum. After careful piloting and faculty development workshops, it instituted a well-thought-out required core course called "American Pluralism and the Search for Equality." While a variety of different courses meet the curriculum requirement, all such approved courses are united by their commitment to a com-

mon set of learning goals for students. Buffalo's 1992 American Pluralism Subcommittee included specifically defined learning goals for students, such as: (1) to develop within students a sense of informed, active citizenship by focusing on contemporary and historical issues of race, ethnicity, gender, social class, and religious sectarianism in American life; (2) to provide students with an intellectual awareness of the causes and effects of structured inequality and prejudicial exclusion in American society; (3) to provide students with increased self-awareness of what it means in our culture to be a person of their own gender, race, class, ethnicity, and religion as well as an understanding of how these categories affect those who are different from themselves; (4) to expand students' ability to think critically, and with an open mind, about controversial contemporary issues; and (5) to provide students with an intellectual awareness of diverse visions of the future as well as processes leading to a more equitable society.

A much smaller institution, St. Edward's University in Texas (approximately 3,300 undergraduates), adopted a fifty-seven-hour core that includes two first-year courses, "The American Experience" and "American Dilemmas." They have also adopted a vertical core that extends from freshman through senior year, thus allowing students opportunities to develop advanced analytical skills and revisit issues over time. By their senior year, students are asked to use insights acquired through their major to solve a pressing social problem as part of their senior culminating education requirement.

Yet another example of an interesting approach to a core diversity requirement is the regionally focused one adopted by the University of Memphis, where the general-education core requirement, "Cultural Confrontations," focuses on the relationships among the three major populations in the mid-South: European Americans, African Americans, and Native Americans. Parallel comparative courses that analyze power and justice can be found in the expanding number of general education courses focused on world cultures.

A newly developing approach to diversity that is located both in general-education diversity courses and in electives and majors focuses on what is called *service learning*, or, less frequently, *community-based learning*. Such credit-bearing courses teach students new intellectual knowledge about diversity, while also providing hands-on experiences that help them become more informed and skilled

in creating more just societies. At Rutgers University in New Jersey, the Civic Education and Community Service Program combines community service with academic investigations about how to work alongside people with diverse backgrounds, while also teaching students more about what is needed to sustain an egalitarian, pluralist democracy. Hobart and William Smith Colleges in Connecticut created more than seventeen courses within two years' time that integrated service learning into academic courses that sought to expand students' capacities to be nation builders through a commitment to justice. Wagner College, located on Staten Island in New York, adopted a new curriculum in 1998 that integrates service learning as a thread woven through all four years as part of the general education requirement.

Whatever model is chosen for diversity requirements, courses across all these designs are more frequently organized through a comparative approach between groups, rather than by focusing on a single group alone. Conceptually, more courses also use an integrative analysis by helping students learn how to analyze multiple kinds of intersecting differences, either within a single group (studying gender or ethnic differences within Latinos/Latinas) or across several groups (studying class and religious differences across European Americans, African Americans, and Asian Americans). Diversity courses within general education also more typically explore moral and ethical questions, and are more likely to analyze systems of injustice, intolerance, inequality, and discrimination—as exemplified in Oregon State University's general education course, “Diversity, Power, and Discrimination.”

Another emerging characteristic of diversity courses in general education is their interdisciplinary approach and the reliance on collaborative, student-centered pedagogies where intergroup dialogue and engagement are deliberately cultivated. In addition, there are also growing examples of innovative couplings between curricular and cocurricular activities, often but not exclusively incorporating living/learning residential dimensions to enrich classroom experiences. In an effort to escape the too prevalent option of choosing either a course on U.S. diversity or a course on world cultures, there is some evidence that more institutions are seeking ways to explore the interconnections between global and domestic diversity, sometimes by teaching U.S. diversity within a global context.

AAC&U's president, Carol Geary Schneider, argues that diversity requirements are, as she puts it, “filling the curricular ‘civic’ space once assigned to ‘Western Civ.’ That is, diversity requirements signal the academy's conviction that in the early twenty-first century citizens need to acquire significant knowledge both of cultures other than their own and of disparate cultures' struggles for recognition and equity” in order to be adequately prepared for the contentious, complex world they face (p. 2). But Schneider asserts more progress needs to be made in developing general education courses that examine diversity in the context of democratic values, histories, and aspirations. Students have too few opportunities to systematically debate the premises and meanings of democracy itself.

### Conclusion

Despite the remarkable transformation and innovation in general education courses and models since 1980, the job is not done—and rightly so. In the best tradition of academic practices, most institutions would admit they don't always get it right the first time and need to submit their established general education designs to regular critique and assessment. While there has been increasing local and national attention paid to evaluating the impact of diversity courses, assessment needs to be more systematically embedded in the institutional life of the college and its faculty. Moreover, in the distinctively fluid, ever-changing environment of higher education, re-examining the effectiveness of the curriculum is a necessity, especially in light of what has become a common fact that students might attend two or three different institutions before acquiring their college degree.

Getting it right also matters because so much is at stake, both educationally and civically. Research examining the impact of curriculum transformation efforts reveals some significant findings. Several studies, for instance, confirm that serious engagement of diversity in the curriculum and the classroom has a positive impact on attitudes toward racial issues, on opportunities to interact in deeper ways with those who are different, on cognitive development, and on overall satisfaction with institutions. Longitudinal research on the effects of the focused use of intergroup dialogues confirm measurable progress in identity development, more comfort with conflict as a normal part of social life, more positive intergroup interactions, and long-

term effects on participation in activities with members of other racial and ethnic groups among dialogue participants.

For all the notably proud progress of U.S. democracy, the United States is a stratified society that continues to be segregated racially in its residential patterns, whether within inner cities or in surrounding suburbia. Higher education is therefore precious mediating public space where, unlike most of American society, different groups live, study, and think side by side. As such, it offers the genuinely authentic daily experience of a multicultural, pluralist, democratic environment. If higher education can seize the rich educational and societal benefits inherent in such a mix, it promises to have far-reaching consequences on the quality of the nation's, and the world's, communal life.

Research has conclusively shown that a racially and ethnically diverse student body has far-ranging and significant benefits for all students. Students learn better in such an environment and are better prepared to become active participants in a pluralistic, democratic society once they leave school. Patterns of racial segregation can be broken by diversity experiences in institutions of higher education.

So it matters that general education courses incorporate diversity in ways that capitalize on the presence of diverse students and the potential for deep and lasting knowledge that affects actions during and after graduation. As Bobby Fong, the president of Butler University, said so eloquently at his inauguration, "The ideal of the academy is to be able to represent fairly the viewpoint of those with whom one most disagrees. But dialogue, however necessary, is not sufficient. The unending conversation is what we must, at all costs, preserve in the academy, but our students need to be equipped for living, in most cases, beyond the academy, in a world where moral decisions, in all their contingency and uncertainty, must be made."

Of course, general education courses cannot carry the intellectual and moral weight of accomplishing all this in one required course, or even in a sequenced series of courses. Each institution needs to take a holistic look at the entire curriculum, the interrelationship between general education and the major, the cumulative kinds of developmental experiences a student might have in progressing towards a degree, and the increasingly complex and demanding questions students are able to pose and answer

as they are challenged to use their new knowledge and civic, intercultural capacities to address real-world problems. If students graduate with the ability to think critically, act responsibly, and negotiate borders that might otherwise divide, then higher education will come closer to meeting its historic mission of not only advancing knowledge, but contributing to stable, more equitable democratic societies.

## MUSEUM AS AN EDUCATIONAL INSTITUTION, THE

---

In ancient Greece the museum was for pure study and contemplation. Culture came first, learning second. In American museums, the earliest examples of the term *education* in museum mission statements were directed toward promoting democracy. In this way education in American museums was tied to the very identity of the nation.

### The Birth of Public Museums

In the late eighteenth century, America saw the development of the public museum. As industrialization progressed, more people moved into cities. The nation's policymakers were taking on more responsibility for social services and the welfare of the nation. Government-funded schooling in industrialized areas was developing. This was a time of great public interest in science, in which citizens were embracing the Founding Fathers' zeal for natural history while finding that technology and industry were

affecting daily life. Amateur collectors formed membership societies for the preservation and study of specimens, which were displayed in what came to be called *cabinets of curiosities*. Leisure activities, such as public lectures on the arts and sciences, had intellectual value.

During the late 1700s and early 1800s education in American museums can be simplified as a time of conflict between scholarship and popularization. Arguably, many of the early American public museums were little more than sideshows of curiosities. The infamous American showman P. T. Barnum exploited public interest in natural history by exhibiting the supposed skeleton of a mermaid and entertaining crowds in institutions that were theatrical venues as much as museums. Two exceptions were the Peale museums in Baltimore, Maryland, and Philadelphia, Pennsylvania. They were created as institutions to help people better their lives. The Peale Museum in Philadelphia used its exhibition space for public health campaigns and demonstrations of the latest technological wonders. For example, its exhibition of piped gas lighting was an entertaining, but convincing, display of how gas lighting could transform Philadelphia. This was the beginning of the public museum where the display of objects was for the enlightenment and entertainment of the public.

### Museums after the Civil War

Education in American museums developed further after the Civil War. In the late 1800s theories of learning proposed that new knowledge was revealed not just through books but also through objects. Consequently, museums, not universities, were places for the production of knowledge. At that time universities were seen as inactive as they were not institutions that created new knowledge. Instead, universities taught knowledge that was already known. The most prestigious universities of the mid- to late nineteenth century tended to be theological institutions that focused on the interpretation of texts, not object-based research.

Producing new knowledge required object-based research. Consider natural history museums, full of objects used in the daily research of scientists. These institutions were central to the pursuit of science. But education existed alongside research. In museums, as new information was discovered, it was made public through exhibitions. This was a striking contrast to universities, where any new knowledge produced was available only to the select audience

there. Museums were seen as democratic institutions, more accessible to the public than universities.

The late 1800s were a boom time for American museums. Great institutions, such as the Metropolitan Museum of Art and the American Museum of Natural History, both in the New York City, and the Art Institute of Chicago opened during these years. Amateur-scientist societies were opening the doors to their cabinets of curiosities for the betterment of the public. American librarian John Cotton Dana was writing about the museum as an instrument for popular culture. He wanted museums to be founded out of the highest ideals for citizens. Yet this period marked a shift in public education institutions, and by the first quarter of the twentieth century, universities had become the primary institutions for public education.

### A Shift in Education

One theory of how public education shifted from museums to universities in the early 1900s points to differences in assessment. As schooling became more common, a large system of assessment grew along with it. Museums did not embrace assessment in their educational activities. Assessment in schools provided the leverage necessary for additional public and government support. Another theory was that the educational activities of museums relied too much on the inherent ability of objects to speak for themselves. It was thought that anyone who studied the object carefully enough, even untrained observers, would understand the object's meaning. Public interest waned when faced with multitudes of objects and little interpretation. In addition, museums faced increasing competition from world fairs, which offered more entertainment than the usually serious museums.

By the 1930s there was already a need to argue that museums could provide a role in public education, even as an assistant to the education that took place in schools. A new generation of curators in museums was focused on collections, not education. Education in museums was no longer built on the production of new knowledge, and instead focused on entertaining and educating the public about information (that was not necessarily up to date). Museums began to turn increasingly to educating schoolchildren.

There was also an increasing diversity and professionalization of methods used to educate the

public. Museums began to appoint instructors to their staff and early scientific studies of museum visitors' activities were carried out. By 1932, 15 percent of all museums offered educational programs. Lectures, tours, demonstrations, and labels became features of many museums. Public outreach was offered through tours for schoolchildren and through printed educational materials along with the loan of objects for classroom use. The presentation of objects in museums changed. Exhibits now included combinations of related objects, dioramas, period rooms, and more realistic taxidermy.

By the 1940s labels, brochures, and lectures were regular features of museums, but they tended to be strictly information based. Education programming now included teacher-training courses, junior museums for children, branch museums at local libraries, and programs for the unemployed. Museums loaned materials to schools, but also shops, hospitals, and community groups. Museum exhibitions and programs were even used to promote patriotism during World War II.

### The National Education Infrastructure

The 1970s saw the development of new educational interpretation methods. Exhibitions of objects began to include film, audio, and even the first computers. There was also a growing awareness of a new type of exhibit, best described as a hands-on display, used to demonstrate scientific phenomena in the earliest science centers, including COSI in Columbus, Ohio, and the Exploratorium in San Francisco, California, which opened in 1964 and 1969 respectively. Perhaps most important, in 1973 the American Association of Museums created a standing professional committee on education. The education committee's purposes include promoting high professional standards for museum educators, advocating for the support of the educational purpose of museums, and promoting excellence in museum learning. This committee signaled a national recognition of the professionalization of education in museums.

In the 1980s education was placed squarely in the center of American museums and their role in the impending new century with the 1984 report of the American Association of Museums, *Museums for a New Century*. This report, and the later *Excellence and Equity*, published in 1992, spotlight education as the central focus of museums' public service. Notably, the reports describe education in broad, pluralistic terms, encouraging museums to provide

educational experiences “by fostering the ability to live productively in a pluralistic society and to contribute to the resolution of the challenges we face as global citizens” (American Association of Museums 1992, p. 6). Museums were once again positioned to make a major contribution to public education.

In the 1990s research showed that museums not only provided rich education experiences for families but also provided direct support for schools. Museums played a role in the national infrastructure that supported public education. Some argued that museums played a unique role by offering benefits not found in schools: Museums were nonthreatening environments that appealed to a wide range of audiences; they offered an interdisciplinary approach; they had more flexibility than schools; and they had the capacity to bring students, teachers, and the public together in new ways. Museum education at the end of the twentieth century was much more than school group tours and classes for adults.

### New Directions

As museums positioned themselves in the educational infrastructure at the beginning of the twenty-first century, there was increasing pressure to address public issues, including failing school systems, community building, and diversifying audiences. Museums responded to this pressure by expanding the range of their educational activities. Education came to encompass the development and interpretation of exhibitions, events, workshops, and even the study of visitors’ experiences and educational outcomes. Museum staff has been involved at a national level in establishing standards for education. Educational training for teachers has been offered through pre-service classes and professional development. Education for children and adults has reached diversified audiences through new programs in new locations, including access programs for visitors with physical or mental impairments, and after-school clubs and activities in museums, churches, and public housing. Education in American museums, as Stephen E. Weil summarized it, has shifted from being about something to being for somebody.

## MUSIC EDUCATION

### OVERVIEW

Richard Colwell

### PREPARATION OF TEACHERS

Carlos Xavier Rodriguez

## OVERVIEW

An observation of music classes in the public schools reveals that little changed in the last half of the twentieth century, including the education of music teachers. The value and role of music education in American schools has been affected, however, by the education reform movement and changes in the organization and delivery of instruction. One major change is that music often is not regarded as a stand-alone subject but is incorporated into an arts education.

Almost all K–6 schools offer some type of required instruction in music. At the middle school level, changes in the instructional format and the addition of electives in other arts courses have reduced the importance of music. The secondary school music program consists largely of performance ensembles, which comprise bands (wind ensembles), choirs, and string or full orchestras. These ensembles are elective although an increasing number of states (about half in 2001) mandate a unit of fine arts at the secondary level. To enable the nonperformer to meet this graduation requirement, courses are offered that may include advanced placement (AP) music theory (usually taken by students who are already enrolled in a music class), beginning guitar and keyboard classes, or an extension of the general music class similar to that offered in the elementary school. The prevalence of the new requirement for an arts course at the secondary level is somewhat misleading as some states define grades seven through twelve as secondary education. There is also a broad interpretation of what constitutes an arts course; some states include literature, foreign language, and photography, as well as music, visual arts, theatre, and dance, while others include the arts as a choice among required electives. The most identifiable change in the music curriculum, found primarily in general music, is a greater emphasis on composition, the instruction of which has been facilitated by computers and the use of multicultural music.

It is difficult to generalize the percentage of students participating in music at the secondary level. Percentage of participation varies greatly depending upon the size of the school, ranging from 5 percent in large schools to as much as half the student body in small or magnet schools. About 35 percent of the student body are enrolled in music for one semester, a percentage that would be about 20 percent at any

one time. Well over 90 percent of the secondary schools offer band and nearly 85 percent offer choral music. String programs are found in approximately 20 percent of high schools, although this dearth is compensated by the all-city/region youth orchestras that provide stunning musical experiences, often rivaling the quality of the local symphony orchestra. String students commonly study music privately outside of school and often began instruction at an early age through a Suzuki-type program.

An important variable in secondary music is the establishment of numerous magnet arts high schools. Students enrolled in these programs do very well academically, as shown through past experience with arts magnet schools like the Interlochen Arts Academy and the North Carolina School for the Arts. James Catterall's research on students enrolled in music for four years reveals that they score appreciably better than average on SAT and ACT tests. This relationship between academic success and the arts is frequently used to promote the concept of "learning through the arts." In 2001 the U.S. Department of Education provided a \$2.5 million grant to the Berkeley County School District in South Carolina to initiate an integrated arts/academic magnet school curriculum.

### Elementary School Music

The required general music program in grades K–6 is less vibrant than it was at the midpoint of the twentieth century. The reduction in curriculum time occurred gradually during the 1970s and 1980s, making it difficult to pinpoint any single cause. Budget reductions are most often cited as the cause, perhaps due to the publicity given to budget caps passed by the legislatures in California and Massachusetts. Whether the caps were causal is a matter of debate but the reduction in curriculum time for music was more likely the result of changes in priorities and not fiscal change. During the 1970s and 1980s fewer discretionary funds were available to school districts due to steep increases in shared costs for special education. Second, greater emphasis was placed on test scores in language arts and mathematics. In addition, elementary classroom teachers were relieved of responsibility for teaching or helping to teach music, due to an extensive campaign by the Music Educators National Conference in behalf of certified music teachers. Fourth, colleges of education reduced the coursework in music required of classroom teachers, making music the area in which these teachers felt

least competent to model and to teach. Also during this period instructional time was reduced from daily classes of 20–30 minutes to a weekly offering of the same length. However, expectations of student competency in music were not lowered and in fact new objectives were added. No public reaction to this change occurred, as school administrators and the public never had a clear idea of the important competencies in music that all students should possess upon completion of a K–6 curriculum. Thus, inadequate time became the norm. Instructional time in the secondary schools was not reduced; thus there was no change in the more visible components of the secondary school's music program.

Music appreciation as an objective in the elementary curriculum lost any cachet it once had (the AP course in music listening was dropped at the secondary level for lack of interest) despite a warning by the National School Board Association in 1988 that performance had replaced appreciation. Singing as an objective became a lower priority. Texts for general music for K–6, consisting of songs with related listening materials for all students, were replaced by specialized programs based on the method and materials of the founder. These programs, primarily Orff, Kodaly, and Dalcroze, became ascendant, along with teacher-constructed offerings consisting of popular and ethnic music, music games, videos, and activities tangentially related to music. When the specialist teacher came in contact with students only once per week and met as many as 500 students during that week, the idea of a sequential curriculum became infeasible, as did the possibility of assisting the student who fell behind. In all states except Louisiana specialists are the primary deliverers of instruction.

The reform movement promotion of basic or core subjects mobilized those interested in elementary music education to demand that music be included as a core subject, returning it to its century-long importance. Music was joined by visual arts, theatre, and dance to create a requirement in arts education. Arts Content Standards were quickly formulated in each of the four arts and in 1994 these standards were the first core addition to be accepted (after the long-standing mathematics standards) by the Secretary of Education. Performance and Opportunity to Learn Standards were also constructed and distributed to members of the four arts professions but these two standards have received scant attention, especially the Opportunity to Learn Standards that

are necessary for students to attain at least a proficient performance level in nine content areas. The Music Educators National Conference (now named MENC: The National Association for Music Education) has vigorously promoted the content standards since their adoption. (The suggestion has been made that if the standards in all of the subjects were adopted that it would add five years to the K–12 curriculum). Two of the content standards in each art form emphasized the importance of relating the four art forms to one another and relating the arts to other subjects in the curriculum. Although it is difficult to imagine how social studies or most other subjects could be taught without consideration of the arts, this content standard shifted the perception of responsibility so that the arts teacher is seen as an aide to the subject matter teacher when the reverse should be true, logically and educationally. The arts standards will not be taken seriously where the classroom teacher is given the responsibility but not the competency to teach in the arts area.

### **Middle School**

With the recommendations of the Carnegie Foundation for the middle school, new curriculum emphasis was placed on student development of a positive outlook toward educational success that would contribute to improved self-confidence and self-esteem. To accomplish this, the middle school curriculum was to be taught by teacher teams in the more basic subjects that, in turn, were to be supplemented by a rich offering of exploratory courses. The arts became part of these elective exploratory courses, frequently competing with chess club and Tae Kwon-Do for available curricular time. (The arts are often a required exploratory for six to nine weeks at one or more of the grade levels of middle school, an arrangement that interferes with any sequential music curriculum during middle school and lacks any connection to elementary school music objectives or to the offerings in the secondary school.)

The involvement of the arts community in supporting the inclusion of the arts as a basic school subject has raised many substantive issues. First, could a national or community artist supplement or replace the certified teacher at a lower cost and provide more authentic instruction? The massive Annenberg grant to the public schools established partnerships between the schools and cultural organizations, a provision that brought performers and composers who had no teacher training into the

schools much like the Ford Foundation's Young Composers Project did in the late 1950s and 1960s and programs of the National Endowment of the Arts, state arts councils, and Young Audiences do in the early twenty-first century. Second, arts organizations raise or find money to support their own curricular vision of a music program or music experience. These organizations provide musical instruments, music scores, and instruction, as well as field experiences such as attendance at concerts and operas. Third, arts organizations have found it easier to work with classroom teachers and their objectives rather than with the heavily scheduled music teacher. The Lincoln Center Institute has operated such a program for twenty-five years, bringing classroom teachers and professional musicians together to facilitate the classroom teacher's objective of an enriched classroom and to aid teachers in attaining goals in their extant curriculums. Fourth, other arts and nonarts organizations have taken a broad approach to education (as opposed to schooling) and initiated after-school programs in music to accomplish several purposes: to provide a balance to remedial programs in the more basic subjects that are offered after school; to provide a safe environment for that time period between the end of the school day and when parents are at home; and to free up the basic curriculum by avoiding the interruption for music class. Fifth, community music centers have a presence in many cities, offering not only private lessons but often ensemble experiences and short-term educational instructional units in the public schools (with their own staff); these offerings consist of content that fits a particular school's monthly or yearly focus. Sixth, all major and community orchestras have initiated educational programs that include youth concerts and preparation for attendance at these concerts. These multiple offers of assistance from the local community are difficult to reject; they cost the schools nothing, are designed for all students in K–6, and administrative-count as part, or all, of the music program.

To describe the music education of Americans one must take into account the value of private music lessons (especially piano and guitar); the impact of radio, television, and compact discs and the listening experiences they provide; and the many informal performing experiences such as garage bands. Should a student's competency in music be the issue, many students could test out of classroom music. However, the opportunity to learn to play an instru-

ment is provided in most schools around fourth grade—the decision of when to offer instrumental music instruction is based more upon the budget than the student's likelihood of success. Also, music educators in K–6 general music have adopted a role in supporting multicultural education. It is interesting to identify music from other cultures and to compare and contrast these types of music. Learning to perform on ethnic instruments is fun and listening exercises are more concrete as much ethnic music has a practical value in its relationship to social studies and other core courses. Western music, written for the concert hall, often does not contain many cultural or historical references; its meaning and importance are based on its formal and aesthetic qualities. Thus, it is no longer possible to definitively describe the K–6 music program in American schools, as the content is not only diverse but also affected greatly by the political currents of the educational reform movement.

### **Early Childhood Music**

Early childhood education frequently includes rich music experiences whether in the private early childhood programs such as Waldorf and Montessori (which extend beyond early childhood) or in public school programs for disadvantaged children. Research, including the Perry Early Childhood Program (HighScope) that has impressive longitudinal data on a sample of students for some twenty years, indicates that music competencies achieved from birth to age five assist students in later school experience. Other research, whose findings are often mislabeled the "Mozart effect," indicates that music listening experiences with very young children play a role in how the brain is wired. This research is focused on temporal-spatial ability and how it relates to the abstract thinking required in mathematics and science. Keyboard experience also may provide a spatial-temporal advantage. These research results also support programs labeled "learning through music" where music is taught not for its musical benefits but for other reasons. The interest in justifying music instruction on the basis of what is learned about other subjects is a contemporary worry, although the powerful instrumental music programs in the secondary schools have long been valued for their role in accomplishing general, nonarts objectives. Students do learn character, responsibility, cooperative learning, how to budget their time, and much more as part of being a contributing member

to an ensemble that has high standards. Students participate because their peers participate and they are attracted by the chance to do things well with their friends. The power of these side objectives does not necessitate the sacrifice of unique musical objectives; however, the perception of school administrators and board members is important for long-term goals.

Music continues to play an important role in special education programs, in music therapy, and with English as a Second Language students. The nonverbal nature of music allows students with special needs to participate in many music experiences and to obtain educational benefits as well as enjoyment.

### Secondary Schools

The instrumental performance program (grades 9–12) is edging toward becoming a semi-independent part of the school day in that it is not fully supported by school funds. Participating students do receive academic credit but that credit is not always computed in a student's overall grade average and many colleges exclude such grades and credit in making admission decisions. *The Instrumentalist* magazine reported in 2001 that more than half of the budget required to support secondary instrumental music programs was raised by students, businesses, and parents through fund-raising or assessments. This percentage likely represents the more advanced band programs. The quality of band programs is steadily increasing with graduates often able to matriculate into college applied music curricula. A study completed by Educational Research Service indicates that slightly more than 20 percent of the funds required to support secondary music programs, including general music, music theory, choral performance, and other academic classes, is raised from outside sources. No longer automatically providing instruments for students, schools have gradually come to expect students to own or rent their own instruments and to pay for expenses associated with contests, festivals, and travel. There are also expenses involved with choral music but these are more limited, restricted to appropriate concert dress and travel funds. Secondary music is, therefore, not affordable for everyone unless support exists for special students.

In other aspects, music education in the secondary schools has not changed significantly. Secondary music teachers have not been affected by the educa-

tional reform movement (except for block scheduling and the addition of more required courses) and are generally unconcerned about the voluntary national standards as some do not relate to ensembles and others are too rudimentary to cause much trouble.

### Philosophy

A single philosophy of music education for K–12 is inappropriate except when speaking of music in the broadest of terms. The need for more than one philosophy is not surprising with a subject as broad and diverse as music, one that provides so many beneficial outcomes. Two distinct philosophies exist in K–12 education, one based on the importance of music education for all students and one based upon the benefits of performance, including aesthetics and opportunities for excellence, for those with interest and talent. Teachers usually adhere to one philosophy or the other based on whether they have interests in elective music or in providing music to all students, regardless of ability. There are somewhat more than 45,000 public secondary school music teachers involved with performance; this represents slightly less than half the music teaching force. MENC reports an estimated 105,000 public school music teachers with an additional 15,000 teaching in private schools (2000a). The complexity of music (Western music has been increasing in complexity for centuries) means that not everyone can adequately perform the music that is important to them. Those who have the ability and time to develop high level performance skills can derive enormous satisfaction, enjoyment, and understanding from performing alone and with others.

External financial support is also important in supporting national arts (music) programs. The Getty Center has taken a special interest in visual arts education, supporting activities and publications to promote Discipline-Based Arts Education, a movement that has had some influence in music as well. Without Getty support, adoption of the voluntary national standards would have been delayed or lost, as would have been the arts assessment in 1997 of the National Association of Educational Progress and the development of the arts teacher component of the National Board of Professional Teaching Standards.

#### PREPARATION OF TEACHERS

Prior to the 1960s the preparation of music teachers in the United States included study in music history, theory, and literature, performance experience in vocal and/or instrumental music, and initial teaching experience in a music classroom. The social and educational upheavals of the 1960s brought about significant changes in this curriculum to include new emphases on contemporary music, world music, contributions of related fields such as psychology and philosophy, and competency-based teacher preparation programs. By the 1970s, the aesthetic education movement, first introduced in widely read texts by Charles Leonhard and Robert W. House, dominated music education. Perhaps the most influential writing on this topic was Bennett Reimer's 1971 explication of the relationship between aesthetic principles and music education. His subsequent monograph (1972, revised in 1989) broadly influenced music teachers to legitimize music instruction that was based on more deeply felt beliefs regarding the nature and importance of musical experience. During the 1990s music teacher education was influenced by the publication of national standards for music instruction formulated by the Music Educators National Conference (1994), which also sparked renewed interest in competency-based programs.

#### Dominant Themes in Music Teacher Education

During the last two decades of the twentieth century, much of the research concerning undergraduate music education programs focused on the student, the instructor, and the program content. Studies emphasizing student roles included the essential characteristics of the effective teacher; teaching styles; musical, intellectual, and personal development; teaching time management skills; formation

of classroom and rehearsal strategies; behavior management skills; leadership skills; and attrition variables. Studies involving faculty included supervisory roles, use of modeling techniques, motivational skills, and professional responsibilities. Studies involving program content included the following:

- descriptive research by regions or type (instrumental/choral)
- use of innovations
- course sequencing
- feedback systems
- use of computers and technology
- use of simulation techniques
- evaluation
- observation
- the content and structure of methods courses
- multicultural components
- interdisciplinary studies
- field-based experiences and student teaching
- the importance of developing a philosophy of music education

Additional studies included historical accounts of music education programs, suggestions for improving evaluation systems, and reports of various educational task forces, which recommend guidelines for curriculum reform.

### Problems in Music Teacher Education

Two competing perspectives have dominated writings and discussions in music teacher education. On the one hand, there is a search for new ways to teach more effectively what has long been regarded as standard curriculum content. On the other hand, there have been attempts to study the role of higher institutions in preparing educators, the systems through which a program's effectiveness is measured, and new emphases in educational psychology that require amendments to program philosophy and procedures. Some writers have expressed continuing concern for the conflict between the conservatory, liberal arts, and educational/professional imperatives present in the modern music education undergraduate program. Adequate coverage of these diverse components is typically not manageable within the context of a four-year program, so many institutions have added a fifth year of study.

Advocates of improved evaluation procedures in undergraduate music education programs cite the

need for evaluation of learning as well as teaching. It has also been recommended that evaluation be presented as a distinct subject within the curriculum as well as used by faculty members to assess student learning. The term *assessment as instruction* is used to describe evaluative measures that are built into the learning process, and pre-service teachers in music performance and general music are encountering more course activities that include such measures.

The role of student teaching in the curriculum continues to be problematic. College faculty are hard-pressed to intensify their roles as supervisors and provide more time within the curriculum for field experiences. Provisions, however, have been identified by in-service teachers as the most important critical to an effective and relevant pre-service education.

Perhaps the most critical problem facing music teacher educators is the need for an increased effort to bridge the gap between educational theory and instructional practice. Few, if any, critics attribute this problem to insufficient study of either. Rather, it is traced to the segregation of these subjects in coursework and a lack of modeling by music education faculty in their own teaching. The success of such an effort requires increased focus and ingenuity on the part of faculty and increased emphasis on the development of problem-solving and independent thinking skills.

### Future Issues

The results of research in musical preference need greater prominence in the undergraduate teaching program. There continues to be a cultural dividing line between "school music" and the world of music beyond the classroom, namely, popular music. The Housewright Declaration, a statement on the future of music education drafted by a subcommittee of the Music Educators National Conference (2000), espouses the increased presence of popular music in American music classrooms, and warns that music teacher training must proceed accordingly by becoming more flexible in its purview of teaching competencies. The implication for pre-service music educators is that they should begin preparing now by learning to teach composition and improvisation, broadening their music vocabularies to encompass pop genres and all types of progressive music, exploring alternative notational systems, designing in-

terdisciplinary projects, and otherwise developing their creative reasoning skills.

There appears to be increasing emphasis on the development of interpersonal skills. As mentioned above, the personal characteristics of effective teachers are well known, but those most highly valued are the ability to detect and accommodate individual learning styles in the classroom, to demonstrate superior communication skills, and to balance efficiently the use of criticism and praise. Although it has not been established how undergraduate programs might best meet this challenge, college faculty will need to utilize measures that increase the individualization of degree programs through assessment of students' interpersonal strengths and weaknesses.

Technological advancements have given rise to more affordable, portable, powerful, and user-friendly systems whose educational worth is difficult to ignore. A required course in computer proficiency for music teaching is common across the nation. Many areas of music learning have been revolutionized by the computer—most profoundly, music composition. Although it is common for instructional curricula to be designed in accordance with available software, the inverse is decidedly optimal for teachers and teaching. Computers should serve to enhance a broad understanding of music and the related arts. The issue of humanism versus technology must be mediated by music education faculty, who can demonstrate proper computer applications to the teaching and learning of music.

A view of musicianship as a world phenomenon has been recommended since the Tanglewood Symposium of 1967. Its importance in a program appears to be largely a matter of faculty expertise and/or interest, as there are no federal, state, or task force mandates for a multicultural component. It should be noted here that the National Association of Schools of Music (NASM) has requirements in this area (and others) to qualify for accreditation, but such accreditation is voluntary. Multicultural music advocates cite the abundance of accessible information, the need for exposure to the many sources of influence in popular music, and the increasingly pluralistic profile of the average American classroom as reasons for a global perspective on music-making. Critics are primarily concerned with the more practical issues of additional time allotments in an already overflowing course load, the selection of

certain musics over others for study, the extent of such studies, and issues of authenticity.

Many of the reforms prescribed for undergraduate music education programs continue to involve a rethinking of balances between the musical, professional and academic components. These translate into decisions regarding classwork versus field experience, musicianship versus teacher training, and whether to emphasize educational theory over instructional practice. A common theme that appears to underlie virtually all teacher education programs is the need for pre-service teachers to develop the cognitive skills necessary to analyze and evaluate effective teaching.

Finally, contemporary conceptions of intelligence have significantly extended the forms of understanding believed to be necessary for teaching. David Elliott posits four types of knowledge—formal, informal, impressionistic, and supervisory—each distinct in its origin and usage in the teaching process. Postmodern philosophy and thinking, regarded by academic professionals as a confounding yet indispensable guiding principle, reminds those entering the teaching profession they must address the difficult questions of what constitutes quality, integrity, and relevancy in instruction as they enter a new millennium of music teacher education.

## NATIONAL ACADEMY OF SCIENCES

---

The National Academy of Sciences (NAS) is one of three honorific societies which, with the National Research Council, are grouped together under the umbrella organization called the National Academies. The other organizations include the National Academy of Engineering (established in 1964) and the Institute of Medicine (1970). Together, the National Academies institutions marshal the talent, expertise, and public spiritedness of roughly 10,000 volunteers and 1,000 staff who work together in more than 500 committees and issue about one report every working day (230 in 2001).

### National Academy of Sciences History

The National Academy of Sciences (NAS) was established in 1863 by an act of Congress that was signed into law by President Abraham Lincoln. This act of incorporation, or charter, created an academy of fifty specified members, with the authority to fill membership vacancies and to create its own laws and organization. Most important, in the words of its charter, the new organization would, “whenever called upon by any department of the government, investigate, examine, experiment, and report upon any subject of science or art, the actual expense of such investigations, examinations, experiments, and reports to be paid from appropriations which may be made for the purpose, but the academy shall receive no compensation whatever for any services to the government of the United States.”

The academy had several historical and national antecedents. In Europe, honorific scientific organizations such as Great Britain’s Royal Society and the

French Academy of Sciences had been founded as far back as the 1660s. In America, the academy’s fore-runners included the American Philosophical Society, formed in 1743 by Benjamin Franklin; the American Academy of Arts and Sciences, established by the Massachusetts legislature in 1780; the Columbian Institution for the Promotion of Arts and Sciences, formed in 1816; and the American Association for the Advancement of Science, founded in 1848. But with the founding of the NAS a new type of organization was created, one that combined an American equivalent to the venerable academies of sciences of Europe with a mission of providing scientific and technological advice to the government. The high honor of election to the academy was thus accompanied by an expectation of public service.

By 1916 the demand for scientific and technical advice exceeded the capacity of the small academy as the United States would soon find itself embroiled in a war and as it faced both domestic and world issues that warranted careful attention to empirical evidence, scientific knowledge, and technological know-how. President Woodrow Wilson therefore called upon the NAS to establish the National Research Council (NRC). Through this body the institution could broaden the participation of scientists, engineers, and other experts who were not elected members of the Academy; perhaps most important, it could engage the expertise of scientists and engineers in industry as well as in academic institutions, again with the principal ethos of voluntary public service.

President Wilson recognized the value of the NRC’s wartime service by asking the NAS to continue the NRC as part of its peacetime organization. Accordingly, it was made permanent by Wilson’s

Executive Order No. 2859 of May 11, 1918, which cited the NRC's capacity for larger service. This larger service was reflected in the NRC's postwar organizational structure, which encompassed fields outside of the traditional physical and natural sciences. Although important work in psychology had been accomplished by the NRC during World War I, this work was placed under other divisions, such as Medical Sciences, or was classified as Special Projects. By contrast, the peacetime organization provided for a Division of Anthropology and Psychology, as well as a Division of Educational Relations. The role of the latter division was to maintain relationships with university and college research activities, "and to study the conditions attending the progress of research in these institutions."

### Behavioral and Social Sciences

From its creation in 1863 the academy provided a place for the behavioral and social sciences in its section of Ethnology and Philology; later its reorganization provided for a standing committee of anthropology in 1899, later renamed Anthropology and Psychology. Members included William James and John Dewey.

Among the early forays of the NRC into the behavioral and social sciences was its involvement in the famous Army Alpha testing program, during World War I, which ultimately led to the application of intelligence tests to thousands of new recruits to the armed services. Other efforts included studies of human biological and sexual function; a study of the feasibility of developing an international auxiliary language (such as Esperanto) in 1919; and studies on human migration from 1922 to 1927. As part of the work of the Committee on Industrial Lighting (1926–1936), the famous Hawthorne experiments on productivity and motivation were initially designed and carried out, as described by Rexmond C. Cochrane in *The National Academy of Sciences: The First Hundred Years 1863–1963* (1978).

In the early twenty-first century the NRC's Division of Behavioral and Social Sciences and Education produces approximately forty reports per year, in the diverse fields of economics, population, child health and development, law and justice, statistics, cognitive sciences, human factors, testing, and education.

### Education

Educational issues were embedded in the Alpha testing program and work studies of the 1920s and

1930s. Other early attention to education in the academy and NRC was focused on problems of education in science—mainly at the postsecondary, graduate, and postdoctoral level. Following the founding of the NRC, the academy's concern in this area had two principal aspects: advanced training in science through a wide variety of fellowship programs, and the maintenance and publication of comprehensive data on the production of Ph.D.'s in the United States.

More recently, however, attention to education has broadened from science education to a concern for the science of education. Amid the cacophony of data and proposed innovations for the nation's educational system, the general public as well as policy makers at all levels of government thirst for the disciplined, honest, and dispassionate rationality of science. The federal government's major elementary and secondary education bill, known as the No Child Left Behind Act of 2001, uses the phrase "scientifically based research" more than 100 times. Growing public concern with the quality of the entire American educational enterprise, in particular with the apparent weaknesses in the elementary and secondary systems—coupled with persistent faith in Lincoln's notion of decision-making informed by rational empirical inquiry—has vastly increased the demand for science-based evidence generally, as well as for the specific consensus-seeking processes of the NRC.

The NRC's current portfolio in education—more than 150 reports since 1993 alone—has been shaped by the confluence of several powerful forces: the advent of the standards-based education movement, which involves focused attention by the science, mathematics, and other academic communities on the content appropriate and necessary for K–12 schooling; significant findings from cognitive, behavioral, and organizational research on how people learn; and increased pressure to find solutions to real-world education problems that are grounded in scientific evidence. As part of a broad reorganization undertaken in 2000, the NRC consolidated most of its education activities in the Center for Education, a unit of the Division of Behavioral and Social Sciences and Education.

Although the gap between research and practice is still formidable, there is no question that the twin goals of improved education research quality and improved use of the results of that research are prominent in the education policy agenda of the

early twenty-first century. This theme—making scientific research accessible by and useful to educators at all levels—pervades much of the academies' current portfolio.

### Notable Studies

Notable education studies conducted by NRC committees and boards in the decade 1992–2001 include the following, organized by major topic area.

**Standards-based reform.** *National Science Education Standards*, published in 1996, offers a coherent vision of what it means to be scientifically literate and describes what all students must understand and be able to do as a result of their cumulative learning experiences. The document integrates content, teaching, assessment, program, and system standards that are key to improving science education.

*Inquiry and the National Science Education Standards: A Guide for Teaching and Learning* (2000) is a practical guide to teaching inquiry and teaching through inquiry, as recommended in the *National Science Education Standards* (the *Standards*) by explaining and illustrating how inquiry helps students to learn science content; mastering how to do science; understanding the nature of science; exploring the dimensions of teaching; and learning science as inquiry for K–12 students across a range of science topics. This volume also examines ways that educators can offer students the opportunities to develop not only an understanding of scientific concepts, but also the ability to solve science problems through experiential learning.

**Science and mathematics education.** *Classroom Assessment and the National Science Education Standards* (2001) focuses on a key kind of assessment: the evaluation that occurs regularly in the classroom by the teacher and his or her students as interacting participants. Focusing on the teacher as the primary player in assessment, the book offers assessment guidelines and explores how they can be adapted to the individual classroom. It features examples, definitions, illustrative vignettes, and practical suggestions to help teachers obtain the greatest benefit from this daily evaluation and tailoring process. The volume discusses how classroom assessment differs from conventional testing and grading—and how it fits into the larger, comprehensive assessment system.

*Adding It Up: Helping Children Learn Mathematics* (2001) examines mathematics education in

the United States from pre-kindergarten through eighth grade, discusses the ways that children learn mathematics, and characterizes effective instruction. The report also recommends ways to improve teaching, learning, and teacher education in the subject.

**Teacher professional development.** As a framework for addressing this task, *Educating Teachers of Science, Mathematics, and Technology: New Practices for a New Millennium*, published in 2001, advocates partnerships among school districts, colleges, and universities, with contributions from scientists, mathematicians, teacher educators, and teachers. It then looks carefully at the status of the education reform movement and explores the motives for raising the bar for how well teachers teach and how well students learn. Also examined are important issues in teacher professionalism: what teachers should be taught about their subjects, the utility of in-service education, the challenge of program funding, and the merits of credentialing. Professional Development Schools are reviewed and vignettes presented that describe exemplary teacher development practices.

The 1997 *Science Teacher Preparation in an Era of Standards-Based Reform* is a report that offers a vision of what science teacher preparation will look like in a standards-based program, and then recommends ways in which the National Science Foundation can mobilize the postsecondary education community to achieve these goals.

**Reading.** Large numbers of American schoolchildren have difficulty learning to read well enough to meet the growing demands of a technological society. Failure to read adequately is especially acute among poor children, minorities, and those whose native language is not English. *Preventing Reading Difficulties in Young Children* is a 1998 report that examines effective methods used to teach young children to read. It reviews relevant research on preventing reading difficulties, highlighting ways to build a learning environment that is conducive to good instruction, to proper diagnosis of problems, and to effective interventions for children at risk. The report recommends key research findings that should be integrated into reading programs for children in preschool and early elementary school, and discusses the policy implications raised by these findings.

*Starting Out Right: A Guide to Promoting Children's Reading Success* (1999), a guidebook for par-

ents, teachers, and child-care providers, builds on recommendations from the 1998 report, *Preventing Reading Difficulties in Young Children*. The guide offers the key elements all children need in order to become good readers; activities that parents and others can do with children so they are prepared for reading instruction by the time they reach school; concepts about language and literacy that should be included in beginning reading instruction; and ways to prevent reading difficulties in early childhood and the early grades.

**Early childhood education.** *Eager to Learn: Educating Our Preschoolers* is a book about the education of children age two to five, focusing on programs outside the home, such as preschool, Head Start, and child-care centers. This report from 2000 argues that promoting young children's growth calls for early childhood settings that support the development of the full range of capacities that will serve as a foundation for school learning.

**Testing and assessment.** *High Stakes: Testing for Tracking, Promotion, and Graduation* (1999) reviews the legal, educational, and psychometric foundations of testing, and recommends policies and practices to promote appropriate use of tests. This book sorts out the controversies that emerge when a test score can open or close gates on a student's educational pathway. The expert panel proposes how to judge the appropriateness of a test; explores how to make tests reliable, valid, and fair; puts forward strategies and practices to promote proper test use; and recommends how decision makers in education should—and should not—use test results. The book discusses common misuses of testing, their political and social context, what happens when test issues are taken to court, special student populations, social promotion, and more.

The movement to improve schools by setting high standards for all students poses new challenges for students with disabilities, whose education is rooted in individual goals and instruction. *Educating One and All: Students with Disabilities and Standards-Based Reform* (1997) is a congressionally requested report that examines how the seemingly contradictory goals of special education and standards-based reform can be reconciled.

**Education research.** The 2001 report *Scientific Inquiry in Education* examines the nature of scientific research and considers the implications for a federal education research agency.

Education in the United States does not rest on a strong research base. The 1999 report *Improving Student Learning: A Strategic Plan for Education Research and Its Utilization* proposes a long-term, highly focused program of research that involves the collaboration of researchers, educators, and policy experts. The plan is designed to increase the usefulness of research to educational practice.

**International studies.** Video technology can help education researchers examine teaching strategies in countries around the world and create a record of classroom practices for future studies. *The Power of Video Technology in International Comparative Research in Education* (2001) discusses how such technology can best be used.

U.S. students' mathematics and science achievement often lags behind that of their peers in other developed nations, but root causes of the disparity are not always clear. Based on a comprehensive analysis of results from the Third International Mathematics and Science Study (TIMSS), the 1999 report *Global Perspectives for Local Action: Using TIMSS to Improve U.S. Mathematics and Science Education* points out how the achievement gap between U.S. students and those in several other industrialized countries can be traced to differences in teaching methods, curriculum content, and school-support systems. The report also contains practical information that American schools can use to improve local programs and student learning. In addition, a supplementary professional development guide offers materials and strategies to help educators lead workshops and planning sessions aimed at enhancing mathematics and science education in the nation's classrooms.

The Third International Mathematics and Science Study (TIMSS) has provided a remarkable volume of intriguing data about the educational performance of students around the world. However, there is a great deal of important follow-up analysis still to be done. The report, *Next Steps for TIMSS: Directions for Secondary Analysis* (1999), based in part on a workshop, summarizes recommendations regarding research strategies that could yield the understanding of student learning that TIMSS was intended to make possible.

## NATIONAL ARCHIVES AND RECORDS ADMINISTRATION

The National Archives and Records Administration (NARA) was established by an act of the U.S. Congress in 1934 for the purpose of housing, protecting, and displaying the documents and records of United States history. The functions of NARA include responsibility for record retention throughout the government. NARA also provides guidance to regional records centers and depositories.

### Organization

NARA includes the offices of Administrative Services, Federal Register, Washington Records Ser-

vices, Regional Records Services, Presidential Libraries, and National Historical Publications and Records Commission, as well as the offices of Contractor Services, Human Resources and Information Services, Information Security, and Inspector General. The administration is headed by the Archivist of the United States, who is supported by the Deputy Archivist and Chief of Staff, and a large permanent staff working at NARA facilities around the country.

NARA operates thirty-three facilities nationwide, including the main National Archive Building on Pennsylvania Avenue in Washington, D.C., the National Archives at College Park in Maryland, and the Washington National Records Center in Suitland, Maryland. Other NARA facilities include sixteen Regional Records Services Centers, ten presidential libraries, and the National Personnel Records Center in Saint Louis, Missouri.

NARA is responsible for managing all documents generated by the executive, legislative, and judicial branches of the federal government. NARA archivists estimate that less than three percent of documents from these sources have enough historical value to warrant retention. Determining which records should be preserved is one of the administration's major responsibilities. At the beginning of the twenty-first century, the National Archives possessed over 21 million cubic feet of textual materials. The vast NARA collection also included some 300,000 reels of film, 5 million maps and charts, about 200,000 sound and video recordings, 9 million aerial photographs, and 14 million still pictures and posters.

The central National Archives Building in Washington, D.C., was constructed in the mid-1930s. The building, which is open to the public, contains a theater, a central exhibit hall that houses the Formation of the Union exhibit, and a semicircular gallery for the States of the Union exhibit.

**Office of Administrative Services.** In addition to administrative functions, the Office of Administrative Services directs the educational programs of the National Archives. Among these are the publication of reports, bulletins, information papers, and guides to records. In 1969 the office began publication of *Prologue*, a scholarly journal that appears four times a year. The office also manages the various exhibits and produces and sells copies of documents and photographs contained in the archives. Documents of major historical importance, such as the three

great charters—the Declaration of Independence, the Constitution of the United States, and the Bill of Rights—are available in facsimile.

**Office of the Federal Register.** The Office of the Federal Register is responsible for publishing *The Federal Register*, a daily newspaper that contains presidential proclamations, executive orders, and administrative regulations, orders, and notices. Once published in *The Federal Register*, an order or regulation is official and binding until later amended or rescinded. *The Federal Register* also contains descriptions of the practices and procedures of federal agencies and departments.

The Office of the Federal Register codifies and publishes all regulatory documents in the *Code of Federal Regulations*. The organization and function of government agencies and departments are described in the *United States Government Organization Manual*, published annually. White House press releases and most of the public messages and statements of the president appear in the *Weekly Compilation of Presidential Documents* and semiannual volumes of *Public Papers of the Presidents*.

**Office of Records Services.** The Office of Records Services is responsible for preserving government records of permanent value and for providing access to them through published guides; microfilm, facsimile, and digital reproduction; research services; and use of the National Archives library and research rooms.

The office maintains a research staff that responds to thousands of inquiries every year. Among these inquiries are many from individuals seeking genealogical, citizenship, or military records. The following collections of records provide extraordinary sources of information: census schedules, naturalization records, homestead applications, immigration passenger lists for ships arriving at various Atlantic and Gulf of Mexico ports, passport applications and related papers, seamen's protection certificates, and bounty-land warrant application files. The Office of Records Services also directs the records retention program of the federal government. It assists federal agencies and department in managing their records and evaluates their records maintenance and disposition programs.

**Regional Records Services centers.** The regional records services facilities were established to deal with the overwhelming volume of records originating in federal offices outside of Washington, D.C., which

were far too numerous to be held within the National Archives Building. A nationwide survey of federal records in the late 1930s found collections of important papers originating in the lower federal courts, in customs offices, in offices of the Immigration and Naturalization Service, and in offices of Indian Affairs and the Bureau of Public Land Management. Many of these papers are on deposit at the regional records services sites.

**Office of Presidential Libraries.** The presidential library system was established in 1939 when Franklin D. Roosevelt donated his personal and presidential papers and part of his estate in Hyde Park, New York, to the federal government. Harry S. Truman did the same in 1950, and in 1955 Congress passed the Presidential Libraries Act, which gave presidents the opportunity to present their personal papers to the American public and to have them administered professionally as part of the archival resources of the United States. Libraries for the collections of presidents Herbert Hoover, Franklin D. Roosevelt, Harry S. Truman, Dwight D. Eisenhower, John F. Kennedy, Lyndon B. Johnson, Jimmy Carter, George Bush, and Ronald Reagan were subsequently established. The William Jefferson Clinton Library was scheduled to open in 2006.

Presidential libraries function as repositories for preserving the papers, records, photographs, films, and other historical materials of U.S. presidents. Each library also includes a museum with exhibits about the life and times of the president. Most of the libraries offer tours, a series of public programs, and resources to aid researchers. The presidential libraries contain not only official materials, but also personal correspondence, diaries, and other records of the president's appointees and associates. These collections, along with related audiovisual materials, are identified by the name of the donor and are arranged, described, and preserved by archivists. The Presidential Libraries Act recognized the right of a donor to place restrictions on the use of his papers, for example, withholding for a period of years information relating to national security or personal family matters.

**National Historical Publications and Records Commission.** The National Historical Publications and Records Commission (NHPRC) was established by Congress in 1934; it is affiliated with the National Archives and Records Administration and chaired by the Archivist of the United States. The mission of the NHPRC is to encourage and fund programs to

preserve, publish, and use archival materials relating to U.S. history. The NHPRC makes grants to state archives, local archives, colleges and universities, libraries, museums, historical societies, and other nonprofit organizations to help identify, preserve, and provide public access to important historical materials. Through grants, fellowships, publications, training programs, and special projects the commission offers assistance and funding to individuals and groups committed to preserving America's documentary resources.

### National Archives Exhibits

The main exhibit hall of the National Archives Building houses the three great charters of American freedom—the Declaration of Independence, the Constitution of the United States, and the Bill of Rights. Until 1952, when the Constitution and the Bill of Rights were transferred to the National Archives, they were moved from place to place, chiefly in the charge of the State Department. Despite these moves, they are still in good condition. The Declaration of Independence was moved more often and treated with less care; consequently, its condition has been impaired. All three documents are now protected from further deterioration. The Formation of the Union exhibit consists of the three great charters and approximately 50 other important historical documents, all on permanent display. The States of the Union exhibit displays federal documents pertaining to the histories of the fifty states.

A fireproof, bombproof vault with a protective lid fifteen inches thick lies twenty feet below the floor of the exhibition hall. The three great charters can be lowered into the vault and the lid closed by an electrically powered mechanism. When the documents are not on display, they are housed in this vault, and in an emergency they can be lowered to safety there in less than a minute.

The exhibit hall and galleries of the National Archives Building in Washington, D.C., were closed for renovation in the early 2000s. While closed, some of the documents usually displayed there were sent to museums and libraries across the country as part of a traveling exhibit called *American Originals*.

### Electronic Access Project

In the mid 1990s NARA launched the Electronic Access Project, which enables anyone with a computer and an Internet connection to access the holdings of the National Archives. NARA's Archival Informa-

tion Locator (NAIL) is a searchable database containing information about thousands of archival holdings, as well as digital copies of approximately 125,000 of the archive's most popular and historically significant documents, photographs, and sound recordings. By 2001 NAIL offered access to only a small portion of NARA's vast holdings, but the project was ongoing and more records were being added to the live database daily.

NARA also produced an Online Exhibit Hall, which features digital copies of the documents displayed in the actual exhibit hall at Washington's National Archives Building. The Online Exhibit Hall also presents special educational exhibits featuring documents and still photographs from the NARA collection. Online exhibits have included *Powers of Persuasion: Posters From World War II*; *Portraits of Black Chicago*; *When Nixon Met Elvis*; and *Tokens and Treasure: Gifts Given to the Presidents*.

NARA's Digital Classroom features reproducible copies of primary documents from the holdings of the National Archives, as well as suggestions and activities for using these materials in the classroom. The NARA publication *Teaching With Documents* was designed to help teachers and students use primary documents effectively in their instruction and research.

## NATIONAL ART EDUCATION ASSOCIATION

---

The National Art Education Association (NAEA) is a nonprofit professional association of art teachers and other people dedicated to the advancement of art in education and national life. The mission of the association is to promote the study of art at all levels of education; to encourage research and experimentation in art; to convince local, state, and federal government officials of the importance of art education; and to improve the status, working conditions, and skill levels of art teachers. The association seeks especially to improve the quality of art education in elementary and secondary schools and in college-level teacher education programs. The NAEA espouses the view that education through art is the means by which individuals realize their creative powers and that the promotion of aesthetic growth is the principal means by which quality art instruction is realized.

#### Program

The NAEA's goal of promoting the knowledge and skill level of art teachers is accomplished through the association's publications program and through its annual national convention, which feature hundreds of workshops, panels, research presentations, addresses, and exhibits. The NAEA's regional groups conduct biennial conferences, where members can engage in direct discussion of problems and exchange ideas and research in the field of art education. In addition, the NAEA sponsors periodic national and international conferences on specific concerns in art education, such as curriculum and instructional development and the uses of new media and technologies.

The NAEA maintains contact with other education groups, such as American Association of School Administrators and the Association for Childhood Education International, in order to communicate

the values and beliefs of art educators to those responsible for the administration and supervision of school art programs. The NAEA also engages in consultative activities and works closely with many organizations in the development of art publications for broad dissemination in the field.

In order to effect a favorable climate of opinion toward art in the community-at-large, the NAEA maintains liaison with organizations concerned with the broad promotion of the arts in society. In past years, the NAEA has contributed testimony on federal art legislation before committees of the U.S. Congress. The NAEA also engages in cooperative projects with state arts councils, state teachers associations, and other private organizations and governmental agencies with an interest in the arts.

The NAEA publishes two major periodicals: *Art Education* and *Studies in Art Education*. The bi-monthly *Art Education* features articles exploring current views on theory and practice in art education, as well as curriculum and teaching strategies for studio arts, art criticism, or art history courses. Each issue includes four full-color art reproductions, with accompanying commentary and lesson suggestions, to be used in elementary and high school art classes. The quarterly *Studies in Art Education* covers issues and research in art education and is directed toward advanced researchers and scholars. *NAEA News*, published six times per year in alternating months with *Art Education*, details the activities of the association at both the national and regional level, and offers book reviews and information about grants and federal initiatives in art education and arts funding.

The NAEA also publishes monographs, books, and pamphlets on topics related to art curricula, instructional media, professional goals, and research. Many NAEA pamphlets are designed to communicate the value of art education to parents, school administrators, government officials, and others outside the field of art education. Other publications promulgate NAEA-devised guidelines for the safe use of art supplies and materials in the classroom and NAEA standards for art education programs. The association also publishes selected bibliographies and information on careers in art.

The NAEA gives out numerous national and regional awards during the year, most at its annual convention. Major annual NAEA awards include the Manual Barkan Memorial Award, the Lowenfield

Award, the Marion Quin Dix Leadership Award, and the J. Eugene Grigsby Jr. Award. Each year the NAEA awards the Charles M. Robertson Memorial Scholarship to a high school student who has excelled in the arts. This four-year scholarship allows the student to attend the Pratt School of Art and Design in New York. Further grants available to NAEA members are awarded by the association's sister organization, the National Art Education Foundation.

In 1978 the NAEA established the National Art Honor Society to inspire and recognize outstanding art students in grades ten through twelve. The NAEA expanded this program in 1989 to include students in grades seven through nine in the hope of generating an early interest in art in younger students.

### **Organizational Structure**

The NAEA is composed of six divisions representing particular areas of interest: elementary education, middle school education, secondary education, higher education, museum education, and supervision and administration. The national organization is also divided into four regional divisions: Eastern, Pacific, Southeastern, and Western.

The NAEA is governed by a board of directors that includes an executive committee lead by a president, a past president, and a president-elect. The board is advised by the officers of the four regional and six area divisions, and by three student chapter officers. The leadership of the regional divisions include a president, past president, president-elect, and one delegate from each state within the boundaries set for the region.

### **Membership and Financial Support**

NAEA members come from each of the fifty states, the District of Columbia, most Canadian provinces, Guam, Puerto Rico, U.S. military bases around the world, and some foreign countries. All individuals who are directly or indirectly involved in art education are eligible for membership. The association maintains seven categories of membership: active, associate, student, institutional, life, patron, and honorary.

In 2001 NAEA had approximately 17,000 members representing every level of education from early preschool art programs to university degree programs, although most members teach in elementary and secondary schools. Not all NAEA members are art teachers, however; some work for publishers of

art books and magazines, art supply manufacturers, museums, and other types of art-related organizations. Many members are students currently enrolled in art teacher education programs in U.S. universities. The NAEA is financed through membership dues, sales of publications, exhibit services, and grants from public, private, and corporate donors.

### History and Development

Historic antecedents to the present NAEA are the art department of the National Education Association and four regional art associations—the Western Arts Association, the Pacific Arts Association, the South-eastern Arts Association, and the Eastern Arts Association. The first National Education Association department of art education was established in 1890 but was short-lived. In 1947 the four regional art associations merged under a single constitution to form the NAEA, which then became officially the Art Education Department of the National Education Association.

## NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS

See: ASSESSMENT, *subentry on* NATIONAL ASSESSMENT OF EDUCATIONAL PROGRESS.

## NATIONAL ASSOCIATION FOR THE EDUCATION OF YOUNG CHILDREN

The National Association for the Education of Young Children (NAEYC) is a nonprofit organiza-

tion of early childhood professionals and others who are dedicated to improving the quality of early childhood education. More than 100,000 members strong, the association comprises a network of more than 400 affiliated local, state, and regional organizations, which share the belief that children's high-quality experiences at home and in child care, schools, and after-school programs lay the foundation for school readiness, academic success, and adult achievement.

Since its founding in 1926, NAEYC has promoted a vision of excellence in early childhood education that focuses on supporting the rights and needs of children. The association works with parents, teachers, business leaders, and policymakers to bring high-quality early education and care to all young children, from birth through age eight. NAEYC is best known for raising the quality of child care and other early learning programs. The association's voluntary national accreditation system helps improve early childhood education and recognizes high-quality programs so that parents and other decision makers can make informed choices. Its position statements, which are informed by research and practice, have addressed a wide range of topics: for example, developmentally appropriate teaching practices; the teaching of reading, writing, and mathematics in the early years; program licensing to ensure health and safety in child care settings; the role of early childhood professionals in preventing child abuse and neglect; and the support of diverse families.

NAEYC focuses on professional preparation, resources, and training for individuals who educate children birth through age eight. Working with higher education institutions to set standards for preparing teachers, NAEYC provides guidelines for appropriate teaching strategies, curriculum, and assessments for children in preschool through third grade. NAEYC promotes comprehensive training opportunities, high professional standards, and equitable compensation and working conditions so that qualified early childhood educators will stay and grow in the early childhood profession. The NAEYC annual conference is one of the largest educational meetings in the nation, bringing together 25,000 people each year for more than 1,000 seminars, workshops and other professional development opportunities.

NAEYC is a leading publisher and distributor of a wide range of books, videos, and other professional

resources to help early childhood teachers and other professionals improve their knowledge and skills. NAEYC also publishes *Young Children*, an award-winning journal that combines the latest in early childhood research, theory and practice, with a readership of more than 250,000. The association also publishes the highly respected *Early Childhood Research Quarterly*.

To increase understanding and support for high-quality early childhood education. NAEYC works among policymakers and the public through its education, advocacy, and public awareness activities. NAEYC also sponsors the Week of the Young Child each spring to focus public attention on the rights and needs of young children.

A board of directors elected by the membership governs the association, and the executive director, responsible for the association's administration and management, sits on the board as an ex officio member. NAEYC is a private membership organization, supported primarily through fees for products and services. The association also accepts philanthropic support for projects that are aligned with its mission and goals and that further its strategic objectives.

In 1926 Patty Smith Hill and Lois Meek Stolz founded the NAEYC's precursor, National Association for Nursery Education, out of their concern about the proliferation of educational programs for preschool children staffed by individuals without adequate knowledge about child development and effective strategies for teaching young children. NANE was maintained primarily through the efforts of stalwart volunteers, who believed deeply in the association's mission. In the early 1960s a headquarters office was established in Washington, D.C., when the association was reorganized as the National Association for the Education of Young Children. The naming of a full-time executive director in the mid-1960s coincided with the creation of the federal Head Start program, designed to provide educational and social enrichment to preschool children living in poverty. Head Start not only focused public attention on the importance of early education, but also nurtured the early childhood profession by providing numerous opportunities for careers in teaching, program administration, and professional preparation and development.

NAEYC continued to grow in size and scope in the 1970s and 1980s, reaching a membership of 45,000 by 1985. That year, the Association created

the National Academy of Early Childhood Programs to accredit child-care centers, preschools, kindergartens, and before-school and after-school programs, again responding to the tremendous growth in the number of children attending preschool and child-care programs. Between 1985 and 2001, the association's membership climbed to more than 100,000, as more than 8,000 early childhood programs achieved accreditation and thousands more enrolled in the process.

By 2001, NAEYC completed major restructuring efforts to revitalize its membership and affiliate structure and to reinvent its accreditation process to meet the challenges of successful growth. In the early twenty-first century, NAEYC is poised for continued growth and success in promoting excellence in early childhood education for all young children and their families.

BARBARA WILLER

## NATIONAL ASSOCIATION OF BIOLOGY TEACHERS

---

The National Association of Biology Teachers (NABT) is the only national association specifically organized to help educators at all levels improve the teaching of biology and life sciences. The purposes of the NABT are exclusively scientific, educational, literary, and charitable. Constitutionally, its objectives are to plan and administer projects for the advancement and utilization of knowledge in biology education; to make available to teachers information concerning the selection, organization, and presentation of biological materials in the classroom; to encourage research in biology education; and to

promote understanding of the interrelationships between biology and society, ethics, and the other sciences.

### Program

Since its formation in 1938 the NABT has concerned itself with an evolving series of issues facing educators of biology and life sciences. Early in its history the association recognized the need for improved conservation education in secondary schools. Later, the NABT promulgated strong positions on the ethical use of animals in the biology classroom. During the 1990s and early 2000s the NABT emphasized the importance of teaching evolutionary theory, the role of biology education in the prevention of HIV/AIDS, and the need to address the impact of global climate change, population growth, and genetic technology. The NABT encourages biology teachers to study such issues, and offers teachers resources for presenting these topics clearly and accurately in the classroom.

The association has also focused its attention on the plight of teachers who are concerned about the social implications of certain subjects pursued in their classrooms. Teachers react differently to controversial issues, depending on their own personalities and backgrounds, the mores of the local community, and the relative authoritarian nature of their school administrators. The NABT believes that biological concepts and discoveries have important implications for society, and the organization fights for the right of teachers to introduce students to these implications.

In 1962 the NABT initiated the nationwide Outstanding Biology Teacher Award program, which recognizes exceptional teachers working with seventh- through twelfth-grade students; one teacher is chosen from each of the fifty states, the District of Columbia, Puerto Rico, and Guam. This award represents the NABT's attempt to recognize and call attention to outstanding performance in the classroom. The Outstanding New Biology Teacher Achievement Award recognizes an educator who has been teaching for fewer than three years. The NABT also presents an annual Evolution Education Award to honor an educator who has made an outstanding effort to promote the accurate understanding of evolution in the community and the classroom. Other annual NABT awards include the Award for Excellence in Encouraging Equity, the Biotechnology

Teaching Award, and the Distinguished Service Award.

The *American Biology Teacher*, published nine times per year, is the official journal of the NABT. It features ideas for biology projects, classroom demonstrations, and science experiments; editorials and book reviews; and articles discussing advances in the life sciences and the social and ethical issues of modern biology. *NABT News and Views*, published four times a year, is the newsletter of the association. It features articles of interest to active members and carries information about NABT programs and events, as well as teaching resources, professional opportunities, and activities of the organization's board, committees, and sections. The NABT also publishes numerous books about issues in biology education, and produces useful online resources for the teacher. The website *Biotechnology on a Shoestring* helps biology teachers in high schools and two-year colleges provide to high quality instruction on a limited budget. The NABT joined forces with the American Society for Microbiology to produce the *Microbial Literacy Collaborative*, a program to foster awareness of the world of microbiology through radio programs, books, and websites.

The NABT holds a national convention each year and also sponsors one or more regional conferences. Thousands of educators attended the 2001 NABT convention, which featured 350 presentations and 140 exhibits. NABT also sponsors frequent seminars and workshops to improve and update biology teachers' knowledge of content and techniques.

### Organizational Structure

The NABT is divided into six sections: elementary/middle school, two-year college, four-year college, multicultural affairs, the role and status of women in biology education, and retired members. Each section is responsible for developing programs in its area. The NABT is governed by a 25-member board of directors. An executive committee transacts business of the association between meetings of the board. A full-time headquarters staff manages the daily administration of the association and implements the policies set by the board of directors.

### Membership and Financial Support

Membership in NABT is available to anyone expressing an interest in biological education. There are eight classes of membership: active, student, comprehensive, foreign, spouse, organizational, sus-

taining, and life. The dues differ with membership class. In 2001 the NABT's total membership exceeded 9,000. Dues and subscriptions accounted for most of the association's annual income. Private and institutional donations, advertising in the journal, and convention fees provided the rest.

## NATIONAL ASSOCIATION OF ELEMENTARY SCHOOL PRINCIPALS

---

The National Association of Elementary School Principals (NAESP) is a professional association dedicated to the professional development of principals serving grades kindergarten through eight. In addition, it seeks to provide a unified voice for its members in local, state, and national policy debates on issues affecting education and school administration. Finally, it seeks to make available resources and other forms of professional support to its members, with the aim of developing high standards of conduct and preparation within the profession.

### Program

The association carries out its mission in three general spheres of activity. First among these is a series of newsletters. The official newsletter for the organization is the *Principal*, a magazine published bi-monthly throughout the school year. Every issue is usually dedicated to a particular theme of interest to members of the profession. Recent issues have been devoted to such topics as the debate on establishing national curriculum standards, career development for veteran teachers, and children's health and safety in the schools. In addition to the magazine, the organization also publishes a number of newsletters devoted to special topics, including *Commentator*, which reports on policies and association news and events. Another newsletter, *Here's How*, offers practical solutions to common problems faced by elementary school administrators. Other special-

interest publications include *Streamlined Seminar* and *Research Roundup*, both of which present the results of recent research in school administration topics; *Middle Matters*, aimed specifically at principals serving in the nation's middle schools; and *Student News Today*, which focuses on working with student councils and other student organizations.

The national organization is also committed to working closely with local and regional associations, and the primary means of accomplishing this is through its field services program. Association members are available as speakers and consultants who can advise interested groups about school administration issues and about projects and programs that show promise in helping to strengthen schools. In addition, the NAESP provides a number of direct-to-members services, such as legal assistance for job-related concerns, both in the area of professional liability and for job-protection suits. It also offers access to a wide variety of educational resources at reduced cost.

The most important event on the NAESP annual calendar is the professional conference hosted by the association each year. In addition to seminars, panel discussions, and workshops, the annual conference provides members with an opportunity to raise their particular professional concerns with the governing board, to network with their peers, and to seek new employment opportunities. The association also sponsors smaller summer conferences in cooperation with other national educational organizations.

### Organization

The NAESP is an autonomous organization with strong ties to the National Education Association (NEA). Its basic governing body is the delegate assembly, whose members are chosen by the individual state associations. This assembly meets annually during the convention and is responsible for establishing policy and responding to the concerns raised by the general membership. A smaller, fifteen-member board of directors is selected by the assembly and consists of three officers, nine regional representatives, a member representing ethnic minorities, a representative of middle school principals, and an executive director. The board appoints the various committees that help in carrying out NAESP business, including a nominating committee charged with selecting the next year's candidates for office and a publications committee, which works

closely with the NAESP's full-time editorial staff. The executive director, supported by a professional staff, oversees the day-to-day operation of the association at the national headquarters.

### Membership and Financial Support

The NAESP has several different categories of membership. At the heart of the organization are the active members who are all professionally engaged in the administration of elementary schools. Associate membership is available to faculty at universities and colleges who share the NAESP's interests but who are not themselves principals or vice principals. A growing membership category is the international associates, made up of principals, headmasters, and other elementary school administrators from outside the United States. The NAESP has in the late twentieth and early twenty-first century become increasingly interested in exploring strategies and policies that have worked well in school programs outside of the United States, with the hope that some may provide useful new insights in addressing local needs and problems. A final membership category comprises aspiring principals: teachers, students, and others who hope to become administrators in elementary and middle schools. Institutional and library memberships are also available.

The NAESP gains much of its operating revenues through its membership dues and through the sale of publications, resource kits, and other services. These funds are supplemented by support from a number of corporate and private donors, who contribute funds toward NAESP-sponsored awards programs. In addition, the association has forged a number of partnerships with corporations that offer services and resources, such as retirement plans or educational and administrative resources.

### History

While taking a summer school course in school administration offered by the University of Chicago, a group of principals got together to discuss the possible usefulness of organizing a formal association that would directly address their special interests. At the end of the course, each of these principals returned to their home districts and began raising support for the plan, so that by the convocation of the 1921 annual convention of the NEA, there were fifty-one willing recruits. They drafted a mission statement, bylaws, and a constitution, thus forming the National Association of Elementary School Principals, and

were duly recognized by the NEA as an independent department of that organization.

The publication division of the NAESP was quickly launched, beginning with a bulletin that laid out the organization's goals and principles, followed by the publication of a yearbook, which contained articles on professional responsibility and leadership. The close association of the NAESP with the NEA continued over the next several decades.

By 1931 the NAESP had grown so much that it was granted permanent headquarters within the NEA offices in Washington, D.C. With this improvement in facilities, the publications division enjoyed a period of expansion as well, and the *National Elementary Principal* was launched. This publication, initially a newsletter, would eventually become the *Principal* magazine. The NAESP also began to move beyond its early focus on defining the administrator's role and status to include a consideration of related issues, such as community relations, controversies in educational standards and approaches, and other topics. Toward the end of the 1930s the organization began to offer additional services, notably a two-week summer workshop dedicated to enhancing professional skills.

In the 1950s the NAESP had grown substantially, and it was finally able to assert its independence from the NEA. Although it has always maintained a close professional cooperation with that organization, independence was important for it allowed the organization to devote all of its time exclusively to furthering the interests of its members. The organization continued to press for professional recognition, to advocate improvements in salary and working conditions, and to provide resources and support services to its members. In the 1980s and 1990s the NAESP focused on outreach to corporate, public, and private organizations to further the association's goals. The national organization remained housed within the NEA headquarters, however, until the 1990s, when it finally established its own independent offices.

## **NATIONAL ASSOCIATION OF INDEPENDENT COLLEGES AND UNIVERSITIES**

---

The National Association of Independent Colleges and Universities (NAICU) is a Washington, D.C.-based umbrella association comprising more than 900 private nonprofit colleges, universities, and associations. The association's purpose is to further the cause of its membership by representing the accomplishments and interests of independent higher education. To accomplish its aims, the NAICU staff represents private higher education to government officials, follows campus trends, conducts research, publishes newsletters and research results, issues papers, and coordinates a variety of nonprofit association activities at the national and state levels.

### **Activities and Membership**

The association's major policy thrusts relate to student aid, taxation, and government regulation. Among the organization's projects has been leadership in the organization of the Student Aid Alliance, a grassroots effort aimed at substantially increasing funding for student aid programs in the federal budget. NAICU has led the effort during congressional election years to encourage member institutions to conduct on-campus nonpartisan voter registration drives through its National Campus Voter Registration project. NAICU is a participating member of the Big Six, an informal group of chief executive officers of the major higher education associations in Washington, who meet regularly to discuss common interests and develop collaborative approaches to lobby the federal government. The organization is represented in the deliberations of the six major Washington higher education associations' federal relations officers meetings, and it participates in the Secretariat, a body of forty associations representing postsecondary institutions that meets monthly to discuss events, activities, and mutual interests.

The NAICU's diverse membership includes liberal arts colleges, research universities, church-related institutions, historically black colleges and universities, women's colleges, performing and visual arts institutions, community colleges, and professional schools such as medicine and engineering.

The NAICU's activities include leadership of a secretariat whose membership is composed of the chief executive officers of national, regional, and other special purpose associations of independent colleges and universities, such as Associated Colleges of the South, Accrediting Association of Bible Colleges, and Association of Independent Colleges of Art and Design. In addition, NAICU collaborates with the Foundation for Independent Higher Education (FIHE) and the Council of Independent Colleges (CIC) to further the aims of independent higher education.

### **History**

The National Association of Independent Colleges and Universities began as the Association of American Colleges (AAC) in 1916, an organization of denominational and independent colleges. AAC's founders were determined to counter charges that there was an oversupply of liberal arts colleges and to help withstand the threatening competition of state institutions.

AAC members had a long history of opposing government interference and, as late as 1963, were opposed to any federal aid to institutions of higher education. AAC suffered from a deep internal division. On the one hand AAC was the chief association advocate for the liberal arts, which meant that the organization included in its membership public institutions and large universities with liberal arts interests as well as small independent colleges, and the small independent colleges felt that they were not adequately represented. To remedy this the Federation of State Associations of Independent Colleges and Universities (FSAICU) was organized within AAC in the late 1960s as a coordinating agency for independent institutions. In a move to expand policy activity, FSAICU was reorganized in 1971 to become the National Council of Independent Colleges and Universities (NCICU), complete with a board independent of AAC and a full-time director of public affairs. The liberal arts versus independent college perspectives continued to divide AAC, and in 1975 an AAC study recommended that a completely separate organization be created to represent the inter-

ests of independent colleges and universities. In 1976 NCICU was disbanded and the National Association of Independent Colleges and Universities was formed, leaving the AAC free to pursue its continuing interest in liberal education. Later the AAC evolved to become the Association of American Colleges and Universities (AAC&U).

Because of its diverse membership, the problem of balance was particularly acute for NAICU. Thus, in the beginning, some NAICU members thought that there was an overrepresentation of presidents of large universities, such as Johns Hopkins and Stanford, on the board, when the membership was composed primarily of institutions with less than 2,500 students. However, NAICU worked at providing fair and equitable representation on its boards and became the peak organization for the large and diverse population of private colleges and universities in the United States, combining an active involvement in lobbying with the provision of a wide range of services to its membership, to government, and to the public.

## NATIONAL ASSOCIATION OF INDEPENDENT SCHOOLS

---

The National Association of Independent Schools (NAIS) is an organization of independent elementary, middle, and secondary schools, as well as regional and local associations representing such schools. Sometimes called private schools, independent

schools are nonprofit; supported by nonpublic funds such as tuition, charitable contributions, and endowments rather than tax or church funds; and governed by boards of trustees. Although independent schools must conform to state compulsory attendance laws, they have considerable freedom in setting standards, in developing curriculum, in admitting students, and in hiring teachers.

#### Program

The main responsibility of the NAIS is to represent member schools to the media, the general public, the U.S. Department of Education, and state and federal agencies and congressional committees that monitor and regulate education in the United States. The attitude of the state and federal governments toward independent schools and laws affecting them are of major concern to the association, which follows federal legislation closely and interprets relevant legislative action to its members.

The NAIS is also concerned with improving the quality of instruction in member schools. To this end, the association sponsors two annual conferences and periodic workshops and seminars, which provide a forum for teachers and administrators to share experiences and exchange ideas. The annual NAIS general conference draws some 4,000 administrators and teachers every year. The association's annual People of Color conference addresses issues of equity in schools and helps members learn how to build school communities that serve all students regardless of ethnicity, economic background, religious affiliation, physical disability, or sexual orientation. Many NAIS programs emphasize the importance of in-service training, refresher courses, and summer travel as part of the necessary, continuing development of teachers. The association also holds seminars on financial planning and advises member schools on fund-raising and business management.

NAIS committees, composed of faculty from member schools, have developed resources for mathematics, science, languages, social studies, art, and music curricula, as well as for the use of new media and computer technologies. The association's publications include the *Independent School Bulletin*, published three times per year, and various books, reports, and newsletters addressing topics of interest to the faculty and administration of independent schools. NAIS also releases publications aimed at in-

dependent school students and parents whose children attend independent schools.

One of the association's main concerns is the affordability of independent schools. To this end, the NAIS publishes numerous guides that describe financial aid opportunities and other ways by which parents can finance their child's education in an independent school. The NAIS also owns and operates the School and Student Service for Financial Aid, which processes financial aid applications for member schools.

### Organizational Structure

The association's governing body is its twenty-six-member board of directors. Half of the board members are selected by national vote at the annual meeting, and half are appointed to represent geographic regions in the United States. Board members serve four-year terms. The board appoints the NAIS president, who oversees association business with the aid of a small staff. The president and board are also responsible for preparing and promulgating official public policy statements regarding legislation, regulations, and other issues.

### Membership and Financial Support

More than 1,100 day schools and boarding schools held membership in NAIS in 2001, representing a total of 472,967 students and 48,385 teachers and school staff. Approximately 9 percent of member institutions were girls' schools; 8 percent were boys' schools. The remaining member schools were coeducational. Member schools ranged in size from several dozen students to several thousand and were located across the United States, Canada, Europe, and Asia in cities, small communities, and rural areas. All schools accepted for membership to NAIS must be nondiscriminatory in admission and employment, and they must demonstrate responsible management and sound fiscal practices.

There are three types of NAIS membership: active, affiliate, and new school. To qualify for active membership, a school must be located in the United States, be at least five years old, and have been recently accredited by a regional association of colleges and secondary schools or by a state department of education. Independent schools located outside the United States may qualify for affiliate membership if they have been in operation at least five years. Newly established schools may apply for new school membership with their status changing to affiliate or

active after five years of operation and accreditation. Local, state, or regional associations of independent schools may also join the NAIS as nonvoting members.

Most of the association's income is from membership dues, sale of publications, and advertisements in the *Independent School Bulletin*. Some income is received from private donors and from foundation grants for special projects.

### History

The NAIS was organized in 1962, the result of the merger of the Independent Schools Education Board and the National Council of Independent Schools. The Independent Schools Education Board was started in 1924 to establish uniform entrance requirements for boys' boarding schools; it gradually added service functions, including publication of the bulletin. The National Council of Independent Schools was formed in 1940 to provide liaison between the government and independent schools. Since the merger, the number of NAIS members has grown, and the association is recognized as the national spokesperson for independent schools.

## NATIONAL ASSOCIATION OF SCHOOLS OF ART AND DESIGN

The National Association of Schools of Art (NASAD) is composed of schools, organizations, and individuals, representing the highest traditions and aims in the education of the artists and designers. NASAD is a voluntary, nonprofit agency with every major center of art education activity em-

bodied in its membership. NASAD gives equal concern to each of the various visual arts. The association is recognized by the U.S. Department of Education and the Council for Higher Education Accreditation as the accrediting agency for college-level programs in art and design.

The aims and objectives of the association are to do the following:

1. Evaluate, through the processes of accreditation, schools of art and programs of studio art instruction—particularly those schools preparing students for careers in art—in terms of the quality of their instruction and the results achieved, as judged by experienced examiners.
2. Establish a national forum to stimulate the understanding and acceptance of the educational disciplines inherent in the creative arts in U.S. higher education.
3. Establish reasonable standards where quantitative measurements have validity, as in matters of budget, faculty qualifications, faculty–student ratios, and library and physical facilities.
4. Encourage varied and experimental approaches to the teaching of art and design, in the knowledge that creativity implies nonconformity and that values in art can be identified only in an appropriate context.
5. Assure students and parents that accredited art programs provide competent teachers, adequate facilities and equipment, and sound curricula and that these programs are capable of attaining their stated objectives.
6. Counsel and assist schools in developing instruction of the highest quality and to encourage self-evaluation and continuing improvement.
7. Invite and encourage the cooperation of professional art and design groups in the formulation of appropriate curricula and standards for the respective professions.

### Program

The major responsibility of NASAD is the accreditation of U.S. higher educational programs in art and design. NASAD also sets guidelines and standards for graduate and undergraduate degrees in art and design, as well as certificate and credentialing pro-

grams for professional artists and designers. In addition, NASAD maintains a list of artists, designers, art teachers, and arts executives and professionals who are willing to serve as consultants. NASAD consultants help institutions with such issues as applications for new accreditation and re-accreditation, curriculum and institutional development, facility and equipment review, and state reviews. Many NASAD consultants are also available for speaking engagements on topics of concern to the art and design community.

NASAD also publishes books, reports, and pamphlets that outline accreditation requirements and procedures, describe research in art and design, record and evaluate statistics, and discuss issues and policies of concern to art students and art educators. The organization's major publications include the *NASAD Directory* and the *NASAD Handbook*, both published annually.

Representatives of member schools assemble annually for a conference on problems of mutual concern regarding the education of the artist and designer, and for an exchange of ideas concerning improvements in education processes. Prominent scholars and creative artists are regularly invited to participate in the program, and meetings are also open to individuals from nonmember institutions and allied fields.

NASAD participates in the Higher Education Arts Data Services (HEADS) Project along with the National Association of Schools of Music, the National Association of Schools of Theatre, and the National Association of Schools of Dance. Begun in 1982, the HEADS Project collects, compiles, evaluates, and publishes statistics from member and nonmember institutions with the goal of providing comprehensive management data on the arts in higher education. All NASAD member institutions must participate in the HEADS Project.

### Organizational Structure

NASAD had 236 institutional members in 2001. The board of directors, elected by the membership, meets regularly during the year and is responsible for the proper conduct of association business. In addition to a commission on accreditation, standing committees of the board are maintained for membership, rules, program, research and development, public relations, nominations, and fellows and citations. Appointed representatives serve as liaison

members with regional accrediting associations. There are no regional, state, or local units of the association.

### Membership and Financial Support

The association offers both individual membership and accredited institution membership. Individual membership is available to artists, designers, and educators. Institutional membership is available to colleges, universities, and independent schools of art and design with NASAD accredited programs. These programs consist of professional schools and professionally oriented college and university art departments with programs leading to the bachelor of fine arts, bachelor of science in design, and similar professional degrees; liberal arts colleges with programs leading to the bachelor of arts degree with a major in art; and junior and community colleges and other schools offering programs of art instruction at the college level that do not lead to a bachelor's degree. Membership is also extended to appropriate professional organizations, societies, agencies, and institutions that are not functioning as schools.

To be eligible for membership, schools must be organized on a nonprofit basis, with appropriate physical facilities and resources, competent faculty and staff, and evidence of permanence and financial stability. Schools seeking fully accredited member status must be visited by an association evaluation team. All member schools and individuals are assessed annual membership dues, which constitute the main source of financial support for the association.

### History and Development

In 1944 representatives of a number of art schools met at the Metropolitan Museum of Art in New York City to focus attention on schools that had or could develop education programs in the new field of industrial design. The meetings continued on a conference basis until 1948. Participants then decided to establish a firm organizational structure and to use the meetings as opportunities to visit schools as well as to exchange ideas and consider issues and problems facing art and design education. The organization thus formed was called the National Association of Schools of Design. In 1960, to more accurately reflect the broad interests of an expanding organization, the name was changed to National Association of Schools of Art, and later to the National Association of Schools of Art and Design.

## NATIONAL ASSOCIATION OF SECONDARY SCHOOL PRINCIPALS

---

The National Association of Secondary School Principals (NASSP) is a national voice for middle level and high school principals, assistant principals, and aspiring school leaders, providing its members the professional resources to serve as visionary leaders. The association was formed in 1916 by a group of seventy-eight high school principals from seven Midwestern states who met in Chicago, Illinois, to establish a professional organization. Headquartered in Reston, Virginia, the NASSP promotes the intellectual growth, academic achievement, character development, leadership development, and physical well-being of young people through its programs and student leadership services.

With nearly 37,000 members in the United States, Canada, and around the world, the NASSP is the largest organization serving middle level and high school administrators. Although most members are principals and assistant principals at public, private, and parochial secondary schools, the association's membership also includes aspiring principals, teachers, professors of secondary education, and retired educators.

### A National Voice

Providing a national voice for principals across the United States is a key objective of the NASSP. As such, the association represents its members before the U.S. Congress and executive agencies of the federal government, monitors federal legislation directly affecting education, writes and delivers testimony before congressional committees, and assists members in advocating for state and federal policies to improve secondary education.

The NASSP supports federal policy initiatives that provide for secondary school programs under

the Elementary and Secondary Education Act of 1965 (ESEA), that require mandatory funding for the federal government's share of the Individuals with Disabilities Act (IDEA), that provide efforts to lessen the impact of the principal shortage, and that guarantee that federal funding is available for the professional development of principals. Specifically, secondary school programs under the ESEA should include school safety initiatives, dropout prevention programs, enhanced curriculum, technology in schools, and developmental reading and writing programs in middle level and high schools.

### Information and Resources

The NASSP provides a variety of publications, resources, and programs designed to assist school leaders in their school improvement process and to enhance student achievement. The NASSP *Bulletin*, a peer-refereed quarterly research journal, is aimed at secondary school administrators and is widely used in graduate-level principal preparation courses. Each issue of the *Bulletin* contains research and scholarly articles that develop a particular theme, such as instructional leadership, funding and equity, teacher recruitment and retention, standards and assessment, and alternative scheduling. Additional essays on other educational issues are also usually included. In September 2000, the NASSP launched the middle school and high school editions of *Principal Leadership* magazine. *Principal Leadership*, published monthly from September through May, offers practical, hands-on strategies for school leaders. Articles appearing in *Principal Leadership* are submitted by practitioners and offer personal insight into a host of educational issues.

Monographs, special reports, and in-depth studies supplement the regular NASSP publications. In 1996, in partnership with the Carnegie Foundation for the Advancement of Teaching, the NASSP released the groundbreaking report *Breaking Ranks: Changing an American Institution*. This report presents recommendations for restructuring high schools in ways that contribute to academic success. Unlike other reports, *Breaking Ranks* embodies a vision developed primarily by high school principals. It draws strength and authority from the fact that it arises from the inside.

*Turning Points 2000*, by Anthony W. Jackson and Gayle A. Davis, is a Carnegie Corporation project published by Teachers College Press and copublished and distributed by the NASSP and the National

Middle School Association. Affirming and extending the original 1989 *Turning Points* model, which is considered the definitive work on reform at the middle school level, *Turning Points 2000* places greater emphasis on teaching and learning, and on the principal's role in ensuring that the focus of reform efforts is directed toward improving curriculum, assessment, and instruction. Together, *Turning Points 2000* and *Breaking Ranks* are the centerpieces for school improvement programs in the nation's middle level and high schools.

### Programs

In 2001 the NASSP announced the formation of three national task forces—Middle School Principalship, High School Principalship, and Principal Preparation. Comprising principals, assistant principals, and professors, these task forces identify best practices in school leadership and in the preparation and development of school leaders; assist in disseminating these practices; advise the NASSP on the development and implementation of standards impacting principal preparation and practice; identify pertinent research topics; and contribute articles for NASSP publications.

To further support its legislative priorities, and in response to members' needs, the NASSP added two Resident Practitioners to the national staff in 2000—one with expertise in creating safe and orderly schools and one with expertise in special education. These practitioners are available to answer members' questions and conduct presentations to large groups of educational leaders.

Cities and states nationwide report principal vacancies and a lack of qualified candidates willing to fill the positions. *The Principal, Keystone of a High-Achieving School: Attracting and Keeping the Leaders We Need*, prepared in 2000 by the Educational Research Service for the NASSP and the National Association of Elementary School Principals, estimates that more than 40 percent of public school principals will retire by 2010. This report identifies the characteristics of effective principals, discusses factors contributing to the shortage, and suggests steps toward breaking down the barriers to attracting and retaining quality school leaders. With more than twenty years experience in assessment and development of instructional leaders, the NASSP, through its leadership development and assessment programs, assists school districts with the identification and development of potential school leaders. These

highly personalized programs measure leadership potential by diagnosing individual strengths and development needs essential to effective leaders.

The association holds an annual convention that attracts more than 5,000 school leaders. The convention offers general sessions featuring speakers of national and international reputation; more than 200 concurrent sessions with distinct middle level and high school strands; exhibits featuring the latest in school technology, curriculum materials, and school supplies; school visits to explore exemplary programs; and informal networking opportunities.

Association programs and services, while most directly focused on the needs of secondary school leaders, also directly touch the lives of students. The NASSP sponsors the National Honor Society (NHS), National Junior Honor Society (NJHS), and National Association of Student Councils (NASC). In 2000 more than 18,000 local NHS/NJHS chapters recognized students for scholarship, character, service, and leadership. In addition, more than 18,000 schools affiliated with the NASC. *Leadership for Student Activities* magazine, published monthly from September through May, provides NHS, NJHS, and NASC advisers and their student leaders with timely articles on leadership topics and ideas for student-centered projects. Three standing committees, the Executive Board of the National Association of Student Councils, the NHS/NJHS Council, and the National Committee on Contests and Activities, ensure that the NASSP maintains its prominent position in the area of student leadership development.

The Trust to Reach Education Excellence (TREE) foundation was created to make grants available to educators and students who would ordinarily not have access to outstanding education opportunities. TREE makes grants to tax-exempt accredited school districts, individual public and private schools, and students. In addition, the TREE 5K, held at the annual convention, raises money for the foundation grants program.

### Organizational Structure

The NASSP is a nonprofit 501(c)(3) organization. The association's twenty-four-member board of directors works with the executive director and staff to set the NASSP goals, priorities, and policies. The board includes two members from each of eight geographic regions; four members who speak for under-represented groups; and two members elected at

large (a middle level principal and an assistant principal). The association's president and president-elect also serve on the board of directors. A steering committee, composed of the president, president-elect, and a board member chosen by the board, oversees association operations between board meetings, which are held four times each year. The NASSP also works cooperatively with fifty-four affiliated state and regional principals' organizations throughout the United States. Individuals who hold membership in both national and state organizations enjoy a range of complementary services.

### Membership

Several categories of membership are offered by the NASSP, each providing a wide range of benefits and services. Individual membership is open to persons engaged in the practice or supervision of middle level or high school administration. Individual membership is not transferable. Institutional membership is also open to persons engaged in the practice or supervision of middle level or high school administration. Institutional members receive all the benefits of individual membership. An institutional membership is in the name of an individual, but is owned by the school. Consequently, an institutional membership is transferable. Educator membership is open to graduate students enrolled in programs in educational administration, professors, parents, and teachers not engaged in administration. NASSP also offers a membership to retired school administrators.

TIMOTHY J. McMANUS

## NATIONAL ASSOCIATION OF STATE BOARDS OF EDUCATION

The National Association of State Boards of Education (NASBE) was established in Denver, Colorado, in 1959. Prior to the establishment of NASBE, individuals who served on state boards of education had limited opportunities to meet to discuss issues related to the development of state education policy. State board members, like many individuals in-

volved in public education in the early fifties, were actually members of the National Education Association (NEA).

At its inception, the National Education Association was an umbrella organization for education professionals and policymakers, including members of state boards of education. The expansion of collective bargaining was incompatible with the concept of a single organization for education interests and resulted in the creation of targeted associations that represented the various components of public education. State and local boards of education initially banded together to form one organization. Several of the members of state boards of education, however, felt their unique interests and needs could not be met in the combined group because of the disproportionate number of local board members in the organization. Consequently, NASBE was created and continues to address the distinct needs of state school boards and their members.

In the early years of the organization, it was the usual custom for individuals to serve on state boards of education for several years. The services and activities of the organization focused on bringing members together and reflected a culture of long-term, extended ministrations. During the late 1980s and into the 1990s, however, the average term of state board service diminished to four years, hence transforming the work of the association to one of assisting boards and members with the rapid pace of policy development. The primary focus of the association turned from one of simply a convener of state board members, to an organization that concentrated on the professional development of board members, training in policy development, and information dissemination.

The length of time individuals serve on state boards of education was not the only change that confronted the organization. With the standards-based reform movement, the nature and focus of policy development of state education changed dramatically. NASBE services in the early twenty-first century reflect the more complex work of state boards, the considerable diversity of views among the membership, and the external influence of legislatures and governors on the policymaking process. Recognizing the expansion of interest in state education policy development outside of the state boards of education, the association opened its doors to other educational leaders, still maintaining its core services to boards. Membership categories within

the association have been developed for others who are interested in education policy development from a state perspective. Although the primary unit of membership is based on a state board of education, a person who does not currently sit on a state board of education may still join as an individual.

The association is a 501(c)3 nonprofit organization, which is governed by a board of directors that includes the offices of president, vice president, immediate past president, and eight area or regional directors. The officers are elected nationwide from four geographic regions, each of which has two representatives on the board of directors. A secretary-treasurer is elected from among the area directors, and there are ex-officio members representing the Council of Chief State School Officers, the National Council of State Education Attorneys, and the National Council of State Board of Education Executives. The board meets quarterly and holds an annual business meeting each October at the Annual Conference of the association. The organization has a Resolutions Committee that annually reviews the standing positions of the organization and each member state may cast a vote to change, affirm, or add resolutions to the association's governing document.

To guide its work between annual business meetings, the board of directors relies on a set of adopted beliefs that assert the following:

- Public education is essential.
- Public education must address the needs of all students.
- Public education is the most fundamental obligation of state government.
- Citizen governance is essential in making public education an enterprise that fulfills its purpose.
- Citizens who serve in position of governance over public education must do so without conflict of interest.
- Every state board member has national level roles and responsibilities.
- Differences among and between states should be recognized and considered when addressing education policy.

To promote those beliefs the association and its management relies on a mission statement that affirms the following:

ANASBE shall be the principal organization for policymakers involved in the field of ed-

ucation. It shall develop and provide information that anticipates critical issues formulated with active participation of state board members. NASBE shall promote policy frameworks that are clearly recognizable as scholarly, student-focused, nonpartisan and adaptable to state by state implementation.

NASBE is financed through a combination of state dues, associate memberships, publication sales, and grants and contracts for services and research projects. The range of issues addressed include, but are not limited to, the examination of policies that affect standards, assessments, accountability, certification, accreditation, special education, diversity, educational technology, and health education.

The organization provides a panoply of services to its members, including in-state technical assistance, annual and legislative conferences, an annual training institute for newly elected or appointed board members, chairs-leadership conference annual study groups, monthly policy and legislative updates, issue-specific publications, and a quarterly journal, the *State Education Standard*. The organization maintains a website, and is involved in numerous collaborative initiatives that augment its influence beyond the confines of state boards of Education. The association has been known for its scholarly approach to issues and consequently commands attention and influence beyond its basic membership.

The association is managed by an executive director, who is hired and evaluated by the board of directors, and who oversees a staff of nineteen professionals.

BRENDA LILIENTHAL WELBURN

## NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES

---

The National Association of State Universities and Land-Grant Colleges (NASULGC) is an organization of more than 200 public universities, land-grant colleges, and state university systems. Within this constituency, seventy-five are land-grant colleges, including seventeen historically black public colleges and universities, and twenty-eight are public higher education systems. Thirty tribal colleges are represented through the American Indian Higher Education Consortium (AIHEC).

### Purpose and History of Association

The NASULGC has major interests in graduate education, research, and international education. The members' composition of mostly public institutions generates the association's policy interests in agriculture, economic development, and technology transfer. The NASULGC institutions annually grant one-third of the bachelor's and master's degrees and award 60 percent of the doctoral degrees in the United States. Seventy percent of U.S. engineering degrees are from NASULGC institutions.

Founded in 1887 as the Association of American Agricultural Colleges and Experiment Stations (AAACES), NASULGC is the oldest national association of institutions of higher education. The AAACES went through several name changes: the Association of Land-Grant Colleges (ALGC) in 1919; then the Association of Land-Grant Colleges and Universities (ALGCU) in 1926; before merging with National Association of State Universities (NASU), started in 1896, and the State Universities Association (SUA), founded in 1930, to form the National Association of State Universities and Land-Grant Colleges in 1963. The three organizations had overlapping memberships and similar interests but were competitive with each other for many years before a merger was effected.

The Association of Land-Grant Colleges and Universities (ALGCU) created a Washington, D.C., office in 1945, with Russell Thackrey as the full-time executive secretary, a position he held through the merger to 1969. After sharing headquarters on Massachusetts Avenue and One Dupont Circle with a number of other higher education associations since 1952, NASULGC moved to New York Avenue in

1998 to occupy a building it had purchased with three other higher education associations. The president of the association presides over a staff of forty.

The NASULGC shares with the American Association of State Colleges and Universities (AASCU) not only a public institution base but also mutual interests in promoting low tuition policies and equal educational opportunities for everyone who can benefit from a college education. Together, NASULGC and AASCU supported a bill favoring direct lending in the 1990s, and NASULGC was alone among the major Washington, D.C., associations in lobbying for national service legislation. A change in the association's bylaws in 1992 allowed most members of AASCU to become members of NASULGC. The two organizations had a history of working together over many decades. The land-grant association shares with the Association of American Universities (AAU) a longtime interest in graduate education and research, and the two organizations often cooperate in lobbying Congress on matters of mutual interest. The NASULGC is a member of the American Council on Education (ACE) and a member of the Big Six, an informal group of Washington, D.C.-based higher education associations whose members reflect the interests of most American higher education institutions.

The NASULGC has a special commitment, through its Office for the Advancement of Public Black Colleges, to promote historically black land-grant institutions and to aid urban universities in building their capacity to deal with urban interests and issues. In 1994 land-grant status was given to 30 tribal colleges, institutions now represented in NASULGC through their membership in the AIHEC.

### Governance and Membership

The NASULGC's basic governing body is its Board of Directors, which consists of representatives from the organization's councils and commissions, six president/chancellor representatives, and three elected officers.

Although NASULGC is primarily a president's association, the organization's ten councils offer the opportunity for provosts, vice presidents, deans, presidents/chancellors, and presidents' spouses to interact with persons in similar roles in other institutions and to participate in the governance and other activities of the association. The six commissions of the organization deal with broad policy issues relat-

ed to the environment, social change, information technology, international affairs, technology transfer, and urban affairs.

Like other associations, NASULGC maintains an extensive information network to keep its members informed and involved in the activities and issues that concern public higher education at the national, state, and local levels. Its Office of Public Affairs deals with media relations, produces and distributes NASULGC publications, including *Newslines*, a newsletter published ten times per year, which keeps members informed on legislation, NASULGC programs, and other items of interest.

## NATIONAL BOARD FOR PROFESSIONAL TEACHING STANDARDS

---

The National Board for Professional Teaching Standards (NBPTS) was formed in 1987 as a response to *A Nation at Risk: The Imperative for Educational Reform* (1983), published by the National Commission on Excellence in Education, and its challenges to improve the quality of teaching and learning in U.S. schools. NBPTS has a three-part mission: (1) to establish high and rigorous standards for what accomplished teachers should know and be able to do; (2) to develop and operate a national voluntary system to assess and certify teachers who meet these standards; and (3) to advance related education reforms for the purpose of improving student learning in schools in the United States.

## Validity

With standards and assessments in place to reach 95 percent of the nation's teachers, research has focused on the validity and the effects of National Board Certification processes. In 2000 Lloyd Bond, Tracy Smith, Wanda Baker, and John Hattie examined the consequential validity of the NBPTS standards and assessments. They sought to locate demonstrable differences between National Board Certified Teachers (NBCTs) and non-National Board Certified Teachers (non-NBCTs). These researchers created a sample of sixty-five teachers who completed all parts of the assessments and who received their scores on these assessments. These teachers were divided into two naturally formed groups, 31 NBCTs and 34 non-NBCTs.

For the next school year, these teachers were observed teaching in their classrooms and interviewed about their teaching. The researchers collected samples of the teachers' lessons, samples of their students' work, and of a variety of other writing assignments given to the students. The researchers interviewed three students in each teacher's classroom and conducted surveys of all children in each classroom. The researchers found that on the thirteen attributes of teaching effectiveness they had identified, NBCTs outscored non-NBCTs. The scores of the NBCTs were significantly higher, statistically, than the scores of the comparison group on eleven of the thirteen attributes. These findings offer firm foundation for the claim that NBPTS assessments actually measure highly accomplished teaching. It should be noted that all teachers scored rather high on all thirteen attributes, suggesting that just completing the entire assessment process enhances a teacher's skills as a practicing professional.

## Candidate Support

Candidate support programs are offered by school districts, teachers organizations, and education schools to guide teachers through the National Board Certification process. In 2001 M. Cramer and J. Cramer conducted focus group interviews of 81 National Board candidates who participated in a support program. The researchers identified three major attributes of successful support programs. First, effective support programs require a knowledgeable and dedicated facilitator. Second, because of the unique demands placed on candidates, the support program must include a structured and sequenced curriculum. Third, creating a learning com-

munity with an ethos of egalitarianism in a high-stakes assessment environment seems to advance teacher growth and development.

In 1999 Iris Rotberg, Mary Futrell, and Anne Holmes surveyed candidates who had completed a local support program and found unequal access to information concerning National Board Certification. According to their report, the materials available from the National Board could be more explicit in their expectations. They also called for more venues for providing such information.

For a 2000 doctoral dissertation, D. B. Bohlen compared the perceptions of candidates who participated in a cohort support program with those who did not. Both the cohort and noncohort candidates found the NBPTS certification process a powerful professional development experience that transformed their views on teaching. Both groups believed that completing the NBPTS processes in a structured and collegial environment enhanced their professional development. Bohlen concludes that teachers seem to welcome the opportunity to study their teaching and the teaching of others in such group settings where deep inquiry and reflection are valued and encouraged.

## Master's Degree Programs

Monographs by Peggy Blackwell and Mary Diez (1998) and Diez and Blackwell (1999) outline in clear and direct language the opportunities to use the NBPTS standards to re-design master's degree programs for teachers who want to remain in the classroom. The program designs they offer include these notions of inquiry, reflection, and using the classroom as a laboratory for learning.

In 1999 Karen Dawkins and John Penick surveyed 300 teachers in North Carolina to assess their beliefs and attitudes about a proposed master's degree program that was aligned with the NBPTS core propositions. The respondents expressed support for content and processes that directly target the capacity to improve teaching and daily interactions with children. The respondents did not dismiss the philosophical dimensions found in most graduate programs for teachers; however, they wanted them focused on professional development and improving teaching skills.

## Candidate Performance

Data collected from the administration of NBPTS assessments indicate that the percentage of candi-

dates achieving National Board Certification increases annually. In the 1999–2000 cycle, 52 percent of all first-time candidates achieved National Board Certification. However, within these data are differential achievement rates among racial and ethnic groups. In a series of studies, Bond and his colleagues inquired into the sources of adverse impacts on achievement rates in an effort to establish a set of conditions that would reduce their effects. These studies have included an external panel review of the standards and assessments, which found no bias inherent in either, and a study of the interaction of assessors and candidates, focusing on the factor race plays in these interactions. This study also yielded no evidence of systematic bias. In studying minority candidates who did not achieve National Board Certification but who retook exercises and who achieved National Board Certification on the next attempt, Bond and colleagues found that these candidates felt underprepared for the amount of reflective thinking required in the assessments, suggesting the need for better teacher preparation.

In 1998 Laura Onafowora studied six African-American candidates who did not initially gain National Board Certification and found that these candidates might not write well extemporaneously. She found the entries of these African-American candidates tended to focus on philosophical themes, such as instilling “survival imperatives” in their students, rather than on their teaching.

### Assessing Accomplished Teaching

Results of studies on the reliable and valid measurement of accomplished teaching, as reported in separate 1998 articles by Bond and Richard Jaeger, offer insights into the process of scoring multidimensional representations of teaching. They highlight the need for new calculations of validity and needed research on measuring performance. In 1997 Drew Gitomer reviewed five major challenges faced in the design, development, and implementation of the NBPTS assessment process. These challenges were: (1) defining scoring; (2) handling a broad range of disciplines and contexts; (3) resolving bias issues; (4) interpreting unfamiliar representations of content; and (5) identifying the cut-score.

### Changing the Profession and Advancing Reform

In a commissioned study of National Board Certified Teachers, Yankelovich and associates surveyed all NBCTs concerning the effects National Board

Certification has had on their ability to change the profession. NBCTs reported, in significant numbers, that they are undertaking new roles and responsibilities in their schools and communities since gaining National Board Certification, including mentoring other teachers, coaching National Board Certification candidates, and serving as clinical faculty in teacher education programs.

The National Board is pursuing its mission to set the benchmark for accomplished teaching. It has overcome political, professional, and psychometric obstacles, and it has spawned a national inquiry into teacher quality. However, it is still a long way from having the kind of research evidence that solidifies its base. By creating the broad categories used to review the current literature, it is hoped further research will occur.

## NATIONAL BUSINESS EDUCATION ASSOCIATION

The National Business Education Association (NBEA) is a private organization devoted to the use

of education to advance ethical standards, professional conduct, diversity, and fairness in the field of business. It is the largest professional organization of its kind in the United States, and its influence is enhanced by the close ties it maintains to other business-related organizations both within the United States and in the international community. Its primary constituency comprises business educators and the administrators of programs of business instruction.

### Program

The NBEA takes as its primary goal the improvement of business education and enhancing the status of the profession. Among the activities it conducts to achieve these ends are a publications program, through which the NBEA disseminates information on the latest innovations in teaching techniques; a strong leadership program designed to improve professionalism within the field of business education; and a lobbying arm, the Legislative Advocacy Committee, which works with lawmakers at the local, state, and federal level to improve the quality of business education. It also sponsors two student organizations, the Future Business Leaders of America (for high school students) and the college honor society Phi Beta Lambda, in the conviction that early education is key to developing business skills and a commitment to civic leadership.

The NBEA has an active publications division, which offers materials on topics of interest to business educators. Its official journal is the *Business Education Forum*, and it also publishes a newsletter, *Keying In*. In addition it publishes the *Business Education Standards*, which establishes standards of competency that should be attained by children from kindergarten to age fourteen in eleven areas of business-related education. Among the areas addressed are accounting principles, business law, marketing, computation, economics, and management. The NBEA also publishes an annual *Yearbook*, each issue of which is devoted to a single topic of importance to business educators. It maintains a website with links to a wide range of business organizations in the United States and abroad.

### Organization

The NBEA has four divisions, each representing a distinct area of professional interest: International; Research; Teacher Education; and Teaching, Supervision, and Administration. The organization is bro-

ken into five regional associations: Eastern, Southern, North-Central, Mountain-Plains, and Western. Overseeing the organization's activities is an executive board, which consists of the presidents of each of the divisions and associations as well as elected representatives of the five regional associations. Conferences and workshops are sponsored at the divisional and regional levels.

The NBEA also has a representative assembly, composed of business and business education leaders from each state and from affiliated business organizations. This assembly provides recommendations on policy, planning, and future activities of the national organization. Through this structure, the NBEA is able to carry out its mission to serve as an information conduit, conveying information among affiliated business organizations for the betterment of all members.

### Membership and Support

The NBEA welcomes all individuals who share its interest in improving business education and advancing the goals of fairness, diversity, and professionalism in the field. Interested parties may choose from five different categories of membership: professional, student, associate, lifetime, and honorary. Only professional and lifetime members are eligible to vote on NBEA issues, serve on the assembly, or be elected to the executive committee. Funding for the NBEA comes from membership dues, the sale of NBEA literature, and fees charged for workshops and seminars.

### History

The NBEA got its start in 1878 when a group of educators from several private schools got together to form the Business Education Association (BEA). The group was chiefly concerned with the dissemination of information of interest to business teachers and published a series of monographs. In 1892 the BEA became a formal division of the National Education Association (NEA) and was renamed the Department of Business Education.

Groups of other independent organizations devoted to principles of sound business education were founded over the next several years, including the National Commercial Teachers Association (1895), the Eastern Commercial Teachers Association (1897), the Southern Commercial Teachers Association (1922), and the National Association of Commercial Teacher-Training Institutions. These and

other like-minded groups joined together to form the National Council for Business Education (NCBE) in 1933, with the goal of establishing national standards in the field of business education.

In 1946 the NCBE merged with the NEA's Department of Business Education to form the United Business Education Association, and headquarters were established at the NEA Center in Washington, D.C. Regional divisions were formed over the next several years, leading to the organizational structure that now characterizes the NBEA. The organization took its present name in 1962.

## NATIONAL CATHOLIC EDUCATIONAL ASSOCIATION

---

The National Catholic Educational Association (NCEA) is the largest professional organization for Catholic educators in the United States. The association's principal objectives are to promote the welfare of Catholic education; to provide Catholic educational institutions with national and regional representation; to enable Catholic educators to work together for professional growth; to foster cooperation between Catholic schools and other professional agencies in the field of education; to facilitate the interchange of ideas; to conduct educational research; and to increase public understanding and proclaim the uniqueness of Catholic education.

### Program

The services provided by the NCEA include a broad spectrum of activities designed to aid Catholic educators. The association sponsors meetings, issues publications, and conducts informational programs. The annual convention and exposition, which attracts over 15,000 participants, is the most important annual forum for the exchange of ideas and information among Catholic educators. The NCEA

sponsors an annual meeting for diocesan school superintendents, regional meetings related to the special needs of particular areas of the United States, and frequent professional workshops dealing with new educational and administrative methods for teachers and administrators.

The NCEA publishes books, monographs, journals, and directories. NCEA newsletters include *News for Catholic School Parent Leaders*, *National Catholic Educators Accent*, and *Pastor Education Digest*. The association's official journal is the quarterly *Momentum*, which includes articles and columns discussing educational theory and methodology, catechetical programs, and important educational issues. The association also makes available to members the services of consultants in guidance and counseling, religious education, accreditation, international education, and other areas of interest.

Other NCEA programs focus on leadership development and training for teachers and administrators at all levels of Catholic education. A retreat program called *Shepherding the Shepherd* is designed to foster the spirituality of teachers and administrators and help them integrate it into their educational efforts. *Sharing the Faith* is a faith development program that provides in-service training for Catholic educators and teaches them ways to balance personal reflection with community building. The *Frontiers of Justice* program, cosponsored by Catholic Relief Services, sends Catholic educators to developing countries to help local Catholic groups develop school systems.

Each year the NCEA, in association with the United States Catholic Conference, sponsors Catholic Schools Week to promote the value of Catholic education, to call attention to the role Catholic Schools play in their communities, and to raise money for school programs and scholarships. Since 1990 the Wednesday of Catholic Schools Week has been celebrated as National Appreciation Day for Catholic Schools.

The association also makes several annual awards, including the Elizabeth Ann Seton Awards to honor people who have made exceptional contributions to Catholic education, and the Leonard F. DeFiore Parental Choice Advocate Award to honor a person who has shown leadership in promoting educational choice.

## Organizational Structure

The NCEA is made up of five departments: the religious education department, the seminary department, the secondary school department, the elementary school department, and the department of chief administrators of Catholic schools. The NCEA also includes a Commission for the National Association of Boards of Education and is an affiliate member of the Association of Catholic Colleges and Universities. Each NCEA department elects its own officers and designates two representatives who sit as voting members on the association's general executive board. The association also includes several sections dealing with special concerns, such as the special projects and public policy section; the leadership development section; and the communications, public relations, and production section. The executive board, headed by a president, oversees the work of the association.

## Membership and Financial Support

Membership in the association is voluntary and open to anyone desiring to further its objectives. Most membership is on an institutional basis. In 2001 the NCEA had more than 200,000 members. The NCEA's chief financial support comes from institutional membership dues, which vary with the size and type of institution, and corporate and private donors. Individuals may join as sustaining members, adult education commission members, or regular members.

## History and Development

The NCEA's founding convention was held in St. Louis, Missouri, in July 1904 when several Catholic education groups joined forces to form the Catholic Education Association. In 1927 the word *national* was added to the name. The growth of the NCEA in size and services parallels the growth of Catholic education in the United States. When the association was started, Catholic schools in the United States enrolled about 850,000 students; in 2001 there were Catholic schools in all fifty states and a nationwide enrollment of more than 7.5 million.

## NATIONAL CENTER FOR EDUCATION STATISTICS

---

The National Center for Education Statistics (NCES) is a federal agency responsible for collecting, analyzing, and disseminating statistical information related to the U.S. educational system. The principle goals of the NCES are to collect data concerning the condition and progress of American education and to make that data available to federal and state public policy makers, professional educators, the public, and the media. The NCES also reviews and reports on education in other countries.

### Programs

The various programs of the NCES supply information and statistical data on such education-related matters as, for example, student enrollment, graduation rates, teacher staffing levels and teacher shortages, student skill and knowledge levels, and state and local educational expenditures. To obtain this information, the NCES conducts numerous surveys on the American educational system. Among the most important are the Schools and Staffing Survey, which monitors teacher supply and demand, as well as the composition of the educational work force in public and private schools across the country. Another survey, the National Assessment of Education Progress, evaluates the knowledge and skills of American fourth, eighth, and twelfth graders in reading, writing, science, mathematics, history, geography, and other subject areas. This survey also evaluates high school transcripts and provides state-by-state comparisons of its findings. The NCES National Study of Postsecondary Faculty reports on faculty and staff characteristics at the nation's col-

leges and universities. The National Adult Literacy Survey measures the reading and writing skills of the American adult population. In addition, the NCES conducts various longitudinal studies that follow different classes of students over a long period of time to assess such factors as academic growth, changes in attitude and motivation, and the ability to transition from one educational level to the next and from school into the labor market.

Federal, state, and local officials use data supplied by NCES to help them plan educational programs. The media use NCES data to inform the public about significant conditions and trends in American schools, such as school dropout and college enrollment rates, the relationship of educational achievement to class size, and the relative success of private and public schools. Members of the general public may examine NCES statistics to become more informed voters and to make knowledgeable decisions about their own and their children's education. Ultimately, wide access to the information collected and reported by the NCES can promote and accelerate the reform and improvement of education in the United States.

The NCES administers numerous programs to collect, process, and report educational data. The NCES Annual Reports Program conducts research on current and emerging topics in education and disseminates annual reports in support of other NCES programs. The Data on Vocational Education (DOVE) Program, established in 1998, collects and collates data from students and faculty involved in vocational education in secondary and postsecondary schools. DOVE also collects information about adults pursuing continuing education and work-related training. The NCES Education Financial Statistics Center conducts research related to the financing of public and private elementary, secondary, and post-secondary education. The Statistical Standards Program provides technical support and develops standards and procedures to ensure the quality and accuracy of NCES statistical surveys, analyses, and reports. The NCES established the National Forum on Education Statistics to improve methods for collecting, processing, and reporting elementary and secondary education statistics. The Forum also provides technical assistance to state and local data collection systems. Since 1994, a branch of the NCES called the Advisory Council on Education Statistics has deliberated

problems facing the NCES and recommended solutions to the NCES Commissioner.

The NCES provides access to its statistical information through the online NCES Electronic Catalog, the National Education Data Resource Center, the National Library of Education, the Resource Sharing and Cooperation Division, and various web posting, CD-ROM releases, and nearly one hundred annual print publications. The major print publications of the NCES include the annual *Digest of Education Statistics*, a compilation of wide-ranging statistical data covering American educational institutions from preschool through graduate school. The *Digest* also compares American schools with schools in other countries. The *Projections of Education Statistics*, a periodic report first published in 1964, provides ten to fourteen year projections on enrollment, graduation rates, teacher levels, and expenditures in America elementary schools, high schools, colleges, and universities. Other periodical publications include the NCES *Education Statistics Quarterly*, which provides a comprehensive overview of work accomplished throughout the NCES over a three-month period.

The NCES also maintains a series of databases on a wide variety of topics addressing elementary, secondary, and postsecondary education at the local, state, and national level. These include *Common Core of Data*, which is the primary database for statistical information about public and private elementary and secondary schools. Another NCES database, the *School District Database*, provides demographic information derived from the most recent census about school districts around the country. The *K-12 Practitioners' Circle* is a website that provides links, resources, and other information for teachers and support staff, administrators, policymakers, librarians, and parents. The online *NCES Students' Classroom* offers children and parents information about schools and libraries, a kid's magazine called *Crunch*, and general educational data, as well as games and quizzes on history, mathematics, science, geography, and the arts.

### Organizational Structure

The NCES is a division of the U.S. Department of Education's Office of Educational Research and Improvement. The NCES is headed by a commissioner and deputy commissioner, who set policy and oversee the operation of the center. There are four main divisions comprising the NCES: the Early Childhood

and International and Crosscutting Studies Division, the Elementary/Secondary and Libraries Studies Division, the Postsecondary Studies Division, and the Assessment Division.

JUDITH J. CULLIGAN

## NATIONAL COMMITTEE FOR CHILDREN AND YOUTH

---

The National Committee for Children and Youth (NCCY) is a private association that was established in 1960 as a part of President Eisenhower's White House Conference on Children and Youth. It was thus part of a larger initiative intended to improve the federal, state, and local services provided to the nation's children.

The committee's original mandate was fivefold. It was to implement the findings of the White House conference, to achieve greater coordination among the various programs and associations that sought to serve the needs of children and youth, to improve

and speed the flow of useful information among interested organizations and agencies, to provide guidance in the planning of activities aimed toward improving children's services, and to identify new problems and issues as they arose in the provision of services to children.

### **Program**

Eisenhower's White House conference established the Council of National Organizations for Children and Youth, a national coordinating council serving some 400 individual youth and children's service providers, and state-based Committees for Children and Youth. The NCCY, as a committee within the national council, functions as an information clearinghouse and consultation service for these member organizations, acting as a liaison between federal agencies and local, regional, and state-based child-service providers. In addition, it plays an important role in reaching out to the community at large and educating the public about child-service goals and issues.

The NCCY fulfills its mission through its publications division. It produces a quarterly newsletter, distributed to service providers and individuals, which recounts the accomplishments and ongoing projects of the various service agencies at all levels of government. It also sponsors conferences that bring together professionals in the field of child services. It has also produced reports, books, and research articles, which are used to train educators, social workers, and other professional child-service providers.

### **Programs**

A central concern of the NCCY since its inception has been to improve literacy among the nation's youth. One important project, aimed at young people in their teens, has been the establishment of remedial reading programs, which seek to improve reading skills in children who have been passed along through the school system without acquiring the ability to read at a basic level of competency. This type of project is typical of the work of the NCCY, involving as it does a collaboration between a number of independent agencies and individuals, such as the U.S. Department of Labor's Manpower Administration, local schools, and social workers. However, the NCCY does not maintain long-term control over such projects. As an initiative proves itself to be successful, the NCCY finds an appropriate agency to

take over the service, thus freeing itself to explore new programs and initiatives.

### **Organizational Structure**

The NCCY is a division within the Council of National Organizations for Children and Youth, and as such it serves the larger agenda of its parent agency. It also works closely with the National Council of State Committees for Children and Youth, each of which elects five of its members to three-year terms of service on the NCCY. The bylaws of the committee provide that at least two members must be under the age of twenty-five, to make certain that the concerns of the committee's target population are understood and adequately addressed.

### **History**

The NCCY was born out of President Eisenhower's 1960 educational initiative, the 1960 Golden Anniversary White House Conference on Children and Youth. The original conference was part of a long tradition in which, at the start of each decade since 1909, the sitting president would call together a wide range of professionals, from educators to physicians, who served the needs of the nation's children and youth. The 1960 conference attracted more than 7,000 participants, drawn from every state and territory in the United States. During the course of the conference, it was determined that a permanent committee should be established to provide continuity, collaboration, and focus for the widely disparate individuals, organizations, and government agencies that shared an interest in child services.

At the 1970 White House Conference, it was decided that each state should establish its own Committee on Children and Youth, and the NCCY's role changed from direct involvement in developing projects to a more advisory and facilitative function. It assumed the responsibility of providing national leadership and serving as an informational clearinghouse through which the local initiatives could be communicated to interested parties, agencies, and committees elsewhere in the country.

## NATIONAL COMMUNICATION ASSOCIATION

---

The National Communication Association (NCA) is the oldest and largest nonprofit, scholarly society dedicated to the field of communication, with a special emphasis on public speaking and other forms of speech communication. Its mission is to promote excellence in the research, teaching, and application of the “artistic, humanistic, and scientific principles of communication.” It has a membership of more than 7,100, representing all fifty states and twenty foreign countries.

### Program

The NCA serves as an informational center and network for individuals working in the broadly defined field of communication. Its primary goal is to organize and disseminate information of relevance to its membership, and it accomplishes this goal through a variety of venues. Each year an annual convention is held, attracting some 4,000 attendees who participate in workshops, seminars, and panel discussions. Also offered are films and presentations on advances in the field of speech communication, employment placement services, and other special-interest activities. The annual convention is also the occasion for the NCA’s various business and planning committees to meet. In addition to the annual convention, the NCA sponsors smaller conferences throughout the year.

In addition to meetings, the NCA disseminates information through a wide range of publications. The first NCA journal, founded in 1915 as the *Quarterly Journal of Public Speaking*, is now published as the *Quarterly Journal of Speech*. Since the inaugural issue of this journal, the NCA has added six others, each with a special focus (education, criticism, text, performance, and so on). The NCA also produces two annuals and an online index, as well as numerous books, monographs, brochures, and pamphlets. The monthly newsletter, *Spectra*, has an electronic counterpart available on the organization’s website.

To encourage excellence in the field of communication, the NCA also sponsors numerous awards, conferred annually at the NCA convention. These awards, many of which carry significant cash grants, recognize achievement in a variety of communication applications, from teaching to “best dissertation.” In addition, the organization sponsors exchange programs, which bring international de-

bate and public speaking teams together for competitions. The official NCA collegiate honor societies are Lambda Pi Eta (for four-year institutions) and Sigma Pi Eta (for community colleges), in addition to which the organization encourages the formation of student clubs on university campuses throughout the country.

The NCA is also actively involved in outreach programs with public and private agencies. Through these programs, the NCA promotes its positions on such issues as communication education, freedom of speech, and presidential debates. The NCA also prepares position papers on legislation relevant to its areas of interest and makes these available to lawmakers at the federal and state level when appropriate.

### Organization and Funding

The NCA is governed by a sixty-member legislative council, which meets annually at the NCA convention, and a ten-member administrative committee, which meets periodically throughout the year. Policy positions are determined by the legislative council, then disseminated throughout the organization in the form of resolutions. When deemed necessary, the legislative council may call for the formation of special committees to do research on special-interest topics, with the purpose of publishing the results of the research. Past examples of such projects include a brochure on careers in the field of speech communication and a book on the rhetoric of the antislavery movement. More recently, the NCA has published brochures on finding grant support for individual research and a volume on Mexican-American rhetoric and the activism of Cesar Chavez.

The NCA is an independent, not-for-profit organization, relying primarily on membership dues, conference and convention fees, and revenues from the sale of its publications to support the majority of its programs. Individual members and special projects receive support from private sponsors as well as from federal granting agencies. Although many of the NCA annual awards are supported by organization funds, it also solicits endowed awards, and as of 2002 there are ten such awards granted through the organization. In addition to individual memberships, the NCA recruits memberships from institutions and libraries. Undergraduate students receive a reduced membership rate.

## History

The National Communication Association was founded on November 28, 1914, in Chicago, Illinois. The impetus for its founding arose from a dispute within the ranks of the National Council of Teachers of English, in which seventeen members broke away from the parent organization to form the National Association of Academic Teachers of Public Speaking. Within a year, the new organization had inaugurated its first publication, *The Quarterly Journal of Public Speaking*. Interest in the new organization was lively, and by 1916 it boasted 160 members.

Within ten years, membership grew to 910, and the organization underwent its first name change, to the National Association of Teachers of Speech (NATS). New services were added to the organizational profile, including job-placement service. In 1934 the organization began publication of *Speech Monographs* (now titled *Communication Monographs*), and membership had topped 2,000. In 1945 the group changed its name, once again, to the Speech Association of America (SAA), under which, five years later, the organization was officially incorporated. In 1953 the association launched its third quarterly publication, *Speech Teacher* (now *Communication Educator*). In 1963 the SAA established its headquarters in New York City and for the first time created full-time administrative positions to facilitate the running of the organization. In 1970 the organization adopted a new constitution and bylaws and once again chose a new name: the Speech Communication Association (SCA).

With professional offices and a national headquarters, the SCA grew rapidly over the next two decades, and its services expanded markedly. New publications were founded to address changes in the field, including *Journal of Applied Communication* (founded 1973), *Critical Studies in Media Communications* (1984), and *Text and Performance Quarterly* (1989). The conference and awards programs were expanded as well. In 1997 the organization underwent yet another name change to become the National Communication Association, and in 2001 the association launched its most recent publication, *Review of Communication*. In the 1990s the NCA outgrew its Manhattan-based headquarters and relocated to Washington, D.C.

## NATIONAL CONFERENCE OF STATE LEGISLATURES

---

The National Conference of State Legislatures (NCSL) was founded in 1975 with the conviction that legislative service is one of democracy's worthiest pursuits. Representing the citizens of a district and the people of a state is the very essence of free government.

NCSL is recognized as the preeminent bipartisan organization dedicated to serving the lawmakers and staffs of the nation's fifty states, its commonwealths, and its territories. It is known nationally for its leadership. All the nation's legislators and legislative staff are members of NCSL. A sixty-member executive committee, elected yearly and composed of legislators and staff, governs NCSL under the leadership of seven officers.

With a focus on service, NCSL is a source for research, publications, consulting assistance, meetings, and seminars. It is the only organization that provides an open, bipartisan, national forum for lawmakers to communicate with one another and share ideas. NCSL is an effective and respected voice for the states in Washington, D.C., representing their interests before the U.S. Congress, the presidential administration, and federal agencies.

The issues legislatures confront are increasingly complex. Each year NCSL answers more than 16,000 questions from legislators and staff. The researchers at NCSL provide lawmakers and their staffs with expert information on a variety of issues, including welfare reform, education, criminal justice, energy, environment, transportation, health care, children and families, the legislative institution, economic development, state finances, uninsured children, automobile insurance, workers' compensation, nuclear waste, clean air and water, gaming, education funding, immigrants, managed care, ethics, and many others.

Each year, NCSL produces some 160 books, newsletters, briefs, and other publications, including

*State Legislatures* magazine, on topics of interest to the states. Its Internet site provides thousands of documents from states as well as those published by NCSL. The site includes numerous databases, features listservs through which lawmakers and staff can communicate, and provides users the ability to perform comprehensive research using multistate searches of legislation, statutes, audits, and other legislative documents.

NCSL assists lawmakers in crafting legislation and in seeking expert witnesses to testify before committees. NCSL also conducts special workshops on specific issues and training programs for legislators and staff. NCSL specialists work with legislative leaders on direct consultation projects on legislative organization and management, rules and procedures, committee operations, personnel policies, strategic planning, and related institutional issues. Nearly half of the sixty-member NCSL executive committee is composed of state legislators.

Legislators and legislative staff have numerous opportunities to attend NCSL meetings on a variety of issues and topics throughout the year. The annual meeting provides more than 160 informative sessions and presents nationally renowned speakers on important concerns. Like legislatures, NCSL is structured to allow free and open debate in committees. The Assembly on Federal Issues is comprised of lawmakers who are interested in federal issues and how they relate to the states. The assembly helps guide NCSL's lobbying efforts in Washington, D.C., through the work of nine committees, and its members are appointed by the presiding leaders in the states. The leader-to-leader meeting, held in Washington, D.C., each year, is the premier gathering for state legislative leaders to discuss pressing federal issues with congressional leaders, cabinet officers, key members of the administration, and often the president. Both legislators and staff can be appointed to the Assembly on State Issues. Through its eight standing committees, members address a set of topics from cultural and economic development and fiscal matters to science and technology.

Legislatures cannot run effectively without professional, high-quality staff. NCSL offers a wealth of learning and professional development opportunities for staff. Among them are an annual seminar to help staff sharpen their skills in research, program evaluation, fiscal analysis, bill drafting, and legislative procedures. Specialized meetings cover presen-

tation skills, media relations, legal research, and skills development in other areas.

NCSL has ten professional staff organizations for researchers, fiscal officers, leadership staff, legal services staff, legislative clerks, secretaries, computer staff, research librarians, program evaluators, and security personnel. With the Hubert H. Humphrey Institute of Public Affairs at the University of Minnesota, NCSL also cosponsors the Legislative Staff Management Institute, an intensive, two-week executive management seminar for senior legislative staff.

NCSL's Leaders' Center assists legislative leaders in meeting the challenges of managing the institution, crafting the best possible public policy, creating consensus out of dissension, communicating with Congress and key administration officials, and protecting and promoting the legislative institution. The Leaders' Center offers specialized services including publications, timely policy information, and ideas for innovative management, and sponsors the annual Leadership Institute for emerging leaders. NCSL offers leaders opportunities to enhance skills, communicate with colleagues in other states, and meet with members of Congress and the administration.

NCSL created the foundation for state legislatures in 1982 to support the innovative research, seminars, and publications for NCSL and the work of two major programs: the Acclaimed Trust for Representative Democracy and the Center for Ethics in Government. The foundation is committed to the important work of strengthening America's legislatures, counteracting cynicism and distrust of the legislative process, and helping lawmakers confront and solve the critical issues of the time.

NCSL's Center for Ethics in Government was created to address a most critical, fundamental and far-reaching problem facing the United States: the loss of public trust and confidence in representative democracy. The center is founded on the principles of belief in representative democracy and the legislative process and that all who work in the public sector have a particular responsibility to operate with high ethical standards. By facilitating ethics sessions for legislators, staff, and state government affairs professionals and through its research arm, the center is a leading force in promoting responsible behavior in legislatures and educating the public on the importance of the legislative process.

NCSL is an extension of the legislature. Its mission is to improve the quality and effectiveness of

state legislatures, to serve as the forum for exchanging information and ideas among legislatures, and to ensure that legislatures have a strong, cohesive voice in the federal system.

## NATIONAL COUNCIL FOR ACCREDITATION OF TEACHER EDUCATION

---

The National Council for Accreditation of Teacher Education (NCATE) is the accrediting body for colleges and universities that prepare teachers and other professional specialists for work in elementary and secondary schools. The NCATE accreditation process aims to ensure that accredited institutions produce competent, caring, and qualified teachers and other professional school personnel who can help all students learn.

NCATE is a nonprofit, 501 (c)(3), nongovernmental coalition of more than thirty national associations representing the education profession at large. The associations appoint representatives to NCATE's policy boards. The boards develop NCATE standards, policies, and procedures. Membership on policy boards includes representatives from organizations of (1) teacher educators, (2) teachers, (3) state and local policymakers, and (4) professional specialists. See Table 1 for a list of NCATE member organizations.

#### Mission

Accountability and improvement are central to NCATE's mission. The NCATE accreditation process determines whether schools, colleges, and departments of education meet demanding standards for the preparation of teachers and other school specialists. Through this process, NCATE seeks to provide assurance to the public that graduates of accredited institutions have acquired the knowledge, skills, and dispositions necessary to help all students learn.

Providing leadership for reform in teacher preparation is also central to NCATE's mission. Through

standards that focus on systematic assessment and performance-based learning, NCATE encourages accredited institutions to engage in continuous improvement based on accurate and consistent data. In this way, NCATE ensures that accredited institutions remain current, relevant, and productive, and that graduates of these institutions are able to have a positive impact on P-12 students.

#### Number of Accredited Institutions

As of 2002, more than six hundred institutions were a part of the NCATE system; 539 of these institutions are accredited, and another 80 to 108 are candidates for accreditation. NCATE institutions produce approximately two-thirds of new teacher graduates in the United States each year.

#### Process

Those institutions interested in attaining national professional accreditation complete an intent-to-seek accreditation form. A mutually convenient date for an on-site visit is set, usually two years in advance of the visit. The institution prepares a self-study, which explains how it believes it meets the NCATE standards. The self-study is sent to examining team members two months prior to the visit. Team members review the self-study and other documents, if available on the institution's website, before the visit. A five- or six-person team visits the institution, arriving on Saturday and leaving the following Wednesday. The weekend is spent examining documents of the institution (student evaluations, copies of curricula, student work, minutes of faculty meetings, etc.). Monday and Tuesday are devoted to interviewing faculty, students, staff, and teachers/principals at clinical sites. The team works in the evening to determine how well the institution is addressing the NCATE expectations. Wednesday at mid-day, an exit interview is held with the head of the education unit, explaining the team's recommendations.

The team finalizes its report in thirty days and returns it to NCATE's office. NCATE sends the report to the institution. The institution may wish to issue a rejoinder if it believes the team missed important information. All of the documents are sent to NCATE's Unit Accreditation Board, which makes a final accreditation decision.

#### History

NCATE was founded in 1954. Five groups were instrumental in the creation of NCATE: the American

Association of Colleges for Teacher Education, the National Association of State Directors of Teacher Education and Certification, the National Education Association, the Council of Chief State School Officers, and the National School Boards Association. When NCATE was founded as an independent accrediting body, it replaced the American Association of Colleges for Teacher Education as the agency responsible for accreditation in teacher education.

**Influence**

The NCATE of the new millennium is implementing a performance-based system of accreditation developed during the 1990s. This system is enhancing both accountability and improvement in educator preparation, as it requires compelling evidence of effective candidate performance for institutions to become accredited. Institutions must show that candidates know the subjects they plan to teach and that they can teach effectively so that students learn.

NCATE standards are increasingly the norm in teacher preparation, and NCATE serves as a resource to the states. Twenty-eight states have adopted or adapted NCATE standards as the state standards for teacher preparation, and seventeen states expect NCATE accreditation of all public colleges with teacher preparation units. In addition, NCATE works in partnership with forty-six states to conduct joint reviews of colleges of education, designed to streamline the quality assurance process and to mesh state and professional standards.

NCATE is part of a continuum of teacher preparation and development that begins with pre-service preparation, and continues with stages of teacher licensure and advanced professional development. Standards in each phase of teacher development are aligned for the first time, providing new coherence to teacher preparation and development.

## NATIONAL COUNCIL FOR THE SOCIAL STUDIES

---

The National Council for the Social Studies (NCSS) is a private, nonprofit organization that, in the words of its mission statement, aims to “provide leadership, service, and support for social studies educators.” It is inspired by the belief that all citizens in a participatory democracy must develop the content knowledge, intellectual skills, and civic values that a solid education in the social studies can impart.

### Program

The central mission of the NCSS is to improve the integrated teaching of the social studies at all levels of education, from elementary school to college and graduate school. To further this end it produced its core publication, a study entitled *Expectations of Excellence: Curriculum Standards for Social Studies*, first published in 1994. In this report, the NCSS lays out a ten-theme, integrated approach to the teaching of history, geography, economics, political science, sociology, psychology, anthropology, and law-related subjects. However, the NCSS is also active in supporting research, encouraging experimentation, fostering dialog among educators and between educators and policymakers, and making available research data that may assist in all these endeavors.

Chief among the NCSS’s services is the dissemination of information, which will help educators to improve their ability to communicate with their students. The NCSS flagship publication *Social Education* seeks to do this by publishing articles on curriculum development, teaching methods, the use of audio and visual aids, classroom projects, and relevant research results. The journal is published monthly throughout the academic year. The NCSS also publishes *Social Studies and the Young Learner*, a journal devoted to exploring the special educational needs of elementary school students, and *The Social Studies Professional*, the council’s newsletter. Both of these are published bimonthly during the academic year.

In addition, the NCSS issues a number of bulletins on specific topics or specific subfields within the larger discipline of social studies. Bulletins appear twice each year in book form. Tightly defined “how-to” tips and techniques are featured in a series of six-to eight-page leaflets. At irregular intervals the NCSS

also publishes books and monographs on topics of interest to its membership.

As the NCSS has long dedicated its energies toward developing standards in the teaching of social studies, it would seem that the trend favoring “standards-based education” would be highly compatible with NCSS philosophy. However, the organization has always taken a holistic approach, which brings together the various disciplines found in the social sciences, behavioral sciences, and humanities. This approach does not always fit comfortably within a curriculum that is strongly driven by objective testing. Thus publications in the early twenty-first century and other NCSS initiatives have begun to explore ways in which educators can remain faithful to NCSS standards while still helping their students pass the externally imposed regimen of objective testing found in many school districts across the nation.

### Organizational Structure

The officers and board of directors are elected to office through the votes of the general membership. The board of directors is responsible for setting council policy, approving projects, and other such high-level decision-making. The board is assisted in its duties by the advice of delegates representing local, regional, and state councils. The board meets officially twice each year; when decisions must be made during the interim between board meetings, an executive council consisting of the president, vice president, president-elect, and two board-appointed members will convene to address the issues. The day-to-day affairs of the council are handled by an executive secretary who is assisted by a professional staff.

### Membership

The NCSS has more than 20,000 members drawn from all fifty states and the District of Columbia, as well as affiliates in sixty-nine countries around the world. Its members include teachers at all educational levels, from first grade to graduate school, as well as nonteaching professionals, such as principals, curriculum designers, and educational specialists in local, state, and national governments. In addition, students who are completing a course of study geared to a career in education are eligible to join.

Direct membership is not the only way to become involved in the NCSS. The council has long been an active promoter of independent councils

and offers such groups the opportunity to become affiliates if they share the general aims and philosophy of the national council.

### History

The NCSS was founded in 1921, shortly after the close of World War I. This was a time when the public school system was undergoing rapid expansion and access to college was being extended well beyond the traditional elite few. Educators in all disciplines were finding that received standards and philosophies of teaching were inadequate to cope with a burgeoning student body, which represented a widely divergent set of skills and prior training.

In response to these pressures, colleges and public school districts across the country were all attempting to come up with workable solutions. Given the extremely independent nature of the public school organization, which was always locally controlled, the result of these efforts was an uncoordinated patchwork of programs, plans, and approaches, and the education received by students could vary wildly in quality and in content. To address this problem, a group of college professors and public school professionals met in Atlantic City, New Jersey. When this group drew up a constitution, elected officers, and agreed to continue to meet, the NCSS was born.

The NCSS set itself the task of finding a way to coordinate the efforts of educators and educational professionals across the country. It soon found some degree of success simply by making all the various groups aware of what their colleagues were doing elsewhere in the country. Thus, even at the outset, communication through publications was recognized to be a highly effective strategy for the NCSS in achieving its goals. Its journal, then titled *The Historical Outlook*, became influential throughout the national educational system. It was renamed *Social Education* in 1937, two years after the NCSS held its first annual conference independent of the National Education Association, on which it was initially dependent.

Over the years the NCSS has grown dramatically in size and influence, not just within the educational community but also with local, state, and federal policymakers. For all its growth and influence, however, it remains committed to the goals that inspired its founding: to serve and support the nation's teachers of the social studies, in the interest of educating new generations of informed, responsible citizens.

## NATIONAL COUNCIL OF TEACHERS OF ENGLISH

---

The National Council of Teachers of English (NCTE) is, according to their literature, "a professional organization of educators in English studies, literacy, and language arts." This private, nonprofit organization is dedicated to promoting English language education at all levels, from kindergarten through graduate studies.

### Program

The NCTE hosts four annual conferences, at which members have the opportunity to attend panel discussions, seminars, and workshops to improve their professional skills. In addition, it maintains a presence at the conferences and conventions of affiliated organizations, such as the Modern Language Association of America (MLA), the International Reading Association (IRA), and the Speech Association of America (SAA).

In addition to the national conferences, the NCTE produces several publications aimed at disseminating information it considers important to its general membership. The official newsletter is *The Council Chronicle*, in which are published articles on the issues, trends, and concerns facing teachers of English. Another publication of general interest is the *English Language Quarterly*. Other periodicals serve specific subgroups in the larger membership: *College English*, *Primary Voices K-6*, and *Teaching English in the Two-Year College*, for example, have clearly defined constituencies. All told, the NCTE supports the publication of twelve journals.

Each year the NCTE also produces twenty to twenty-five books, most of which are specifically intended as teacher's guides or texts. Among recent titles are *Teaching Poetry in High School*, *Lesson Plans*

for *Substitute Teachers*, and *Evaluating Writing*. This continues a long tradition; the first full-length publication produced by the NCTE was *Current English Usage*, produced in 1935 and long a staple in high school classrooms.

The NCTE also sponsors a number of annual awards. Two are granted to individual students in every state and are meant to recognize outstanding achievement in writing. Candidates are nominated by their high-school English teacher and must submit three writing samples. A third award, also granted on a state-by-state basis, honors the best student publication of the year. Finally, there is the David H. Russell Award for Distinguished Research in the Teaching of English, awarded in recognition of scholarly achievement by a member of the NCTE.

Because professional development is an important aspect of the NCTE mission, the council is committed to supporting its membership in advancing their skills as well as their knowledge of the changing nature of American education, particularly as it affects the teaching of English. For this reason it maintains the NCTE Research Foundation, which makes available grants to support scholarly research.

A final aspect of the NCTE mandate is advocacy. The council is actively involved in providing guidance to policymakers at the local, state, and national level on all issues relevant to the teaching of English. For instance, the NCTE has been very active in the fight against censorship of reading materials in schools, and has been equally involved in advising policymakers on ways to expand and improve literacy among the nation's children.

### Organization

As of 2002 the NCTE had 77,000 active members in the United States and Canada. The council recognizes the wide range of interests and specializations represented within its membership, which is therefore broken out into three separate divisions: elementary (K–6 grades), secondary (middle school and high school), and collegiate. In addition, there are several special-interest departments called *conferences*. These are the Conference on College Composition and Communication (CCCC), the Conference on English Education (CEE), the Conference for English Leadership (CEL), the Two-Year College English Association (TYCA), and the Whole Language Umbrella conference (WLU). Each division is run by a section committee and an independent governing board.

The publications arm of the NCTE is separately administered. In addition to the books and periodicals produced by the organization, there are bulletins, public information updates, and special reports issued to members as well as to the broader public.

The national council is overseen by a board of directors, made up of representatives from all the divisions as well as from affiliated, nonmember groups such as the MLA. A slate of nominees is developed by a nominating committee, then voted on by the current board. The board meets annually to discuss NCTE business. A smaller executive committee is responsible for the day-to-day activities of the council and includes a president, vice president, executive secretary, treasurer, and representatives from each of the council divisions, as well as the immediate past president. This group meets with greater frequency, three times a year on average, and reports its activities to the board of directors.

Affiliate organizations, from local English associations to national organizations with a strong interest in the promotion of English language use and literacy, are an independent but highly valued constituency within the NCTE. Their participation in national conferences is actively encouraged. In addition, such groups are frequently enlisted in the pursuit of NCTE-sponsored special projects, such as literacy campaigns, curriculum development, and teacher education.

### Membership and Financial Support

The NCTE prides itself on keeping its membership open to all teachers of English and others in related professions. The council supports its programs by membership dues, paid annually, and through the sale of its books and other published materials. In addition, it receives government support in the form of grants.

### History

The NCTE was founded in 1911 by a group of educators in Chicago, Illinois, known as the English Round Table of the National Education Association. This group wanted to create a professional response to changing needs and values regarding education, particularly English language education. The impetus for this early effort was a concern that school curriculums were becoming too narrow and were incapable of addressing the needs of an increasingly diverse student population. A special committee was formed to address these issues.

These concerned educators at first set themselves a limited task: to explore the problems arising from a rigid, narrowly defined approach to English language instruction. Soon, however, it became apparent that more was needed, and that only a national professional organization would have the ability to affect policy decisions. By 1919 the original investigatory committee had grown large enough to become such an organization. Because of its open-door policy regarding membership, the NCTE from the first maintained a divisional structure, with separate groups representing elementary, secondary, and postsecondary educators.

Over the next several decades the organization continued to grow. By 1948 it was clear that the simple divisions based on grade level were inadequate, and the CCCC was formed to address the special needs of communication and composition teachers at the college level. This reliance on committee organization proved to be extremely useful, for it permitted interested groups to concentrate their focus on particular issues or trends. Membership grew dramatically in the second half of the twentieth century, and over the years new committees were formed, leading to the five-conference structure in place at the beginning of the twenty-first century.

## NATIONAL COUNCIL OF TEACHERS OF MATHEMATICS

Since its inception in 1920, the National Council of Teachers of Mathematics (NCTM) has been dedicated to improving the teaching and learning of mathematics. NCTM has positioned itself as a leader in efforts to ensure an excellent mathematics education for every student and to provide sustained professional development opportunities for every mathe-

matics teacher to grow professionally. The mission of the National Council of Teachers of Mathematics is to provide the vision and leadership necessary to ensure a mathematics education of the highest quality for all students.

With more than 100,000 members and more than 250 affiliates in the United States and Canada, NCTM is the world's largest organization dedicated to improving mathematics education in grades pre-kindergarten through twelve. NCTM offers vision, leadership, and avenues of communication for mathematics educators at the elementary school, middle school, high school, and college and university levels.

In representing the interests of its members in the debate of public issues, NCTM's government relations activities are dedicated to ongoing dialogue and constructive discussion with all stakeholders about what is best for students.

#### Principles and Standards

In April 2000 NCTM released its *Principles and Standards for School Mathematics*, which are guidelines for excellence in pre-K–12 mathematics education and a call for all students to engage in more challenging mathematics. The *Principles and Standards* provide a vision for mathematics education in the future, one with higher standards for both teachers and students.

*Principles and Standards for School Mathematics* has four major components. First, the principles reflect basic perspectives on which educators should base decisions that affect school mathematics. These principles establish a foundation for school mathematics programs by considering the broad issues of equity, curriculum, teaching, learning, assessment, and technology.

The NCTM standards describe an ambitious and comprehensive set of goals for mathematics instruction. The first five standards present goals in the mathematical content areas of number and operations, algebra, geometry, measurement, and data analysis and probability. The second five describe goals for the processes of problem solving, reasoning and proof, connections, communication, and representation. Together, these standards describe the basic skills and understanding that students will need to function effectively in the twenty-first century.

## Resources

NCTM develops and publishes a wide array of resources for teachers. A series of thirty *Navigations* volumes is being published to assist teachers in bringing the *Principles and Standards for School Mathematics* into the classroom. The content of *Principles and Standards* is extended online at NCTM's website through *E-Standards* and *Illuminations*. The *Illuminations* website was developed to further illustrate the NCTM standards and provide teachers with lesson plans and learning activities for students to put the standards into practice. It provides standards-based Internet content for K–12 teachers and classrooms.

## Professional Development

NCTM provides a range of professional development opportunities through annual, regional, and leadership conferences, and through the publication of professional journals and other publications. The association coordinates several regional conferences and one annual meeting each year, with a combined attendance of more than 30,000. Its Academy for Professional Development, founded in 2000, provides two- and five-day training institutes for mathematics teachers.

*Reflections* is another element of NCTM's professional development for teachers. The *Reflections* website offers online video examples of mathematics instruction to help teachers apply in-depth analysis and discussion to improve their own skills. Included are online discussions with lesson-study critiques, video of students' work during class and on their assignments, and a professional analysis with teachers' discussions.

NCTM publishes four professional journals: *Teaching Children Mathematics*; *Mathematics Teaching in the Middle School*; the *Mathematics Teacher*; and the *Journal for Research in Mathematics Education*. Other publications include the monthly member newsletter, the *NCTM News Bulletin*, and more than 200 educational books, videos, and other materials. Each year in April, the council sponsors the World's Largest Math Event and publishes a colorful activity booklet with related activities that teachers can use across the grades.

The National Council of Teachers of Mathematics also works closely with the National Council for Accreditation of Teacher Education (NCATE), which delegates to NCTM the review of its institu-

tions' mathematics teacher preparation programs. NCATE accredits 519 institutions, which produce two-thirds of the nation's new teacher graduates each year. Through its review of these schools' mathematics programs, NCTM helps to ensure that future teachers will be prepared for the classroom.

In 1976 NCTM founded the Mathematics Education Trust (MET) to provide funds directly to teachers to enhance the teaching and learning of mathematics. MET offers twelve grant and scholarship award programs for teachers. In addition to grants to individual teachers, MET honors mathematics educators with its annual Lifetime Achievement Award for Distinguished Service to Mathematics Education.

## Governance and Membership

The National Council of Teachers of Mathematics is a nonprofit organization governed by a fifteen-member board of directors consisting of the president, past president or president-elect, and twelve elected members who serve three-year terms. The executive director is an ex officio member of the board. The president serves a four-year term on the board, consisting of one year as president-elect, two years as president, and one year as past president.

As a professional association, NCTM derives its strength from its members. Membership is composed primarily of K–12 classroom teachers, university educators specializing in mathematics education, and educational institutions (such as college libraries and schools). Members participate in the work of approximately seventy national committees and task forces and contribute to all aspects of the council's work. Through its executive, conference services, finance and administration, human resources, information technology, member services and marketing, and publications divisions, the council's 110 employees manage an annual budget of \$16 million.

## NATIONAL EDUCATION ASSOCIATION

---

The National Education Association (NEA) is America's oldest and largest professional employee organization committed to the cause of public education (as well as to the well-being of its members). Founded in 1857 in Philadelphia, and now headquartered in Washington, D.C., in 2001 the NEA membership includes more than 2.6 million elementary and secondary school teachers, college faculty, education support professionals, school administrators, retired educators, and students preparing to become teachers. The NEA has affiliates in every state as well as in over 13,000 local communities across the United States.

### Membership

Anyone who works for a public school district, a college or university, or any other public institution devoted primarily to education is eligible to join the NEA. The organization also has special membership categories for retired educators and college students studying to become teachers. More specific membership information can vary among state and local affiliates. Members pay dues to be part of the NEA, and in return are provided with a wide range of services from the organization. The NEA has long been active in trying to improve the economic status of teachers and education professionals by assisting in the negotiating of employment contracts with local school boards.

Issues the NEA includes in negotiations are salary schedules, grievance procedures, instruction methods, transfer policies, discipline, preparation periods, class size, extracurricular activities, sick leave, and school safety. The NEA assists local affiliates in negotiations through consultation by field representatives and through the production of resource materials. In defining the role of its members, the NEA developed the *Code of Ethics for the Educational Profession*. In 1975 NEA members adopted the code, which “indicates the aspiration of all educators and provides standards by which to judge conduct.”

### Governance

The NEA is a democratic organization, and the structure and policy of the NEA are outlined in the organization's constitution and bylaws. NEA members nationwide set association policy and change the bylaws and the constitution of the organiza-

tion—most notably through the annual Representative Assembly (RA), which is held every July. The Representative Assembly is the primary legislative and policymaking body of the NEA. It derives its powers from, and is responsible to, the membership. NEA members at the state and local level elect the more than nine thousand RA delegates, who in turn elect NEA's top officers, debate issues, and set NEA policy at the Representative Assembly.

Between Representative Assemblies, NEA's top decision-making bodies throughout the year are the board of directors and the executive committee. The board of directors consists of at least one director from each association affiliated with the NEA, as well as an additional director for each twenty thousand active NEA members in each state, six directors for the retired members of the NEA, and three directors for the student members. The board meets four times a year, plus one meeting in conjunction with the Representative Assembly.

The executive committee consists of nine members: the three executive officers of president, vice president, and secretary treasurer, and six members elected at-large by delegates to the Representative Assembly. The executive committee meets approximately seven times a year.

### Staff and Administration

NEA is a volunteer-based organization supported by a network of staff at the local, state, and national level. At the local and state level, NEA affiliates are active in a wide array of activities, ranging from conducting professional workshops on discipline and other issues that affect faculty and school support staff to bargaining contracts for school district employees. At the national level, more than five hundred employees work for the NEA at its headquarters in Washington, D.C. The NEA staffing structure is designed to help realize the NEA's strategic priorities.

### Policies

During the 1998–2000 budget years, it was decided by the membership that the association's priority work would concentrate on three areas of concern: student achievement, teacher quality, and school system capacity to support student success. The organization's staff departments were assembled with these three core priorities in mind.

**Student achievement.** Increasing student achievement is NEA's first strategic priority. Making sure

that all students have the skills and knowledge to function successfully in school so that they may also succeed as adults is critical to the Association's strategic focus on rebuilding public confidence in public education. This department is dedicated to helping local affiliates address issues such as high-stakes testing and implementing standards-based education. It also helps affiliates advocate for and influence instructional policy and practice at the local level and implement the NEA's annual Read Across America child literacy event, which is held every March 1 in honor of the birthday of Dr. Seuss (Theodor Geisel).

**Teacher quality.** The single most important factor in enhancing student achievement is teacher quality. The NEA stands by the belief that without a qualified teacher in every classroom, student learning is limited and access to quality education is compromised. NEA's Teacher Quality Department is designed to help all teachers achieve high standards for practice. Through this department, the NEA promotes rigorous standards for access to, and graduation from, teacher preparation programs; advocates that all teacher education institutions meet the high standards set by the National Council for Accreditation of Teacher Education (NCATE); and insists on comprehensive teacher induction programs, which include mentoring support systems for new teachers that enhance professional practice and teacher retention. The department also seeks to ensure that all personnel hired to teach are fully licensed; promotes the strategic recruitment and retention of licensed teachers in shortage areas; advocates standards-driven professional development and teacher evaluation systems that work to enhance performance; and advances strategies to increase the number of teachers, particularly minority teachers, who become National Board Certified.

**School system capacity.** The NEA is working to enhance school system capacity to assure that America's schools have the staff, structures, and resources needed to improve student achievement. Toward this end, work in this department establishes systems that support quality teaching and high levels of learning. The NEA is also seeking to increase financial support for public education, stimulate the recruiting and maintaining of quality school staffs, improve the physical learning environment, ensure safe and orderly schools, promote equity and excellence among school districts, and help educators, parents, and other interested citizens develop more

effective school management and decision-making processes.

### Activities

At the state level, NEA activities are wide-ranging. NEA state affiliates, for instance, regularly lobby legislators for the resources schools need, campaign for higher professional standards for the teaching profession, and file legal actions to protect academic freedom.

At the national level, NEA's work ranges from coordinating innovative projects to restructuring how learning takes place and fighting congressional attempts to privatize public education. At the international level, NEA is linking educators around the world in an ongoing dialogue dedicated to making schools as effective as they can be. On an individual level, NEA members organize themselves into voluntary groups called *caucuses*.

NEA affiliates around the country celebrate three major events: Read Across America Day; American Education Week (the week before Thanksgiving); and National Teacher Day (the Tuesday that falls in the first full week of May, which is Teacher Appreciation Week).

**Lobbying and elections.** One of the most prominent education lobbying group in the nation, the NEA is influential in politics—ranging from school board elections to the presidential election. With 2.6 million members in America's schools, one in one hundred Americans is an NEA member. This makes NEA a loud voice in America's public-education policy debate.

NEA's lobbying efforts are based on the initiatives passed by the Representative Assembly, and usually involve school funding issues, student testing requirements, and federal funding for needy schools. The NEA has a political action committee (PAC) named the Fund for Children and Public Education, which is used to contribute funds to candidates running for office who uphold the principles of the NEA and its affiliates. Members donate to the PAC, but it is not funded through dues assessments like many other labor union PACs.

**Communications.** The NEA is often called upon to serve as a voice for teachers and public education in national media outlets. Usually the organization's president serves in this role, though oftentimes NEA staff are also asked to be spokespeople for the association. Additionally, the NEA produces and disseminates

nates several publications. The most widely read is the *NEA Today* monthly magazine, which is sent to all NEA members. There are also publications put out by the NEA for its different constituencies, including retired members, student members, and members in higher education institutions.

**Research.** As a way of serving its members, the NEA has a research department that looks into issues concerning teachers and public education. The most widely used research document produced by the NEA is the yearly *Rankings and Estimates*, which ranks state school statistics such as teacher salaries, per-pupil expenditures, and student enrollment. Every five years, the NEA research department produces *Status of the American Public School Teacher*, which is an intensive look at the attitudes of members about their workloads and toward the profession and compensation.

### History

The NEA was founded in 1857 as the National Teachers Association, “to elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States.” In 1870 the NTA united with the National Association of School Superintendents and the American Normal School Association to form the National Educational Association. The organization was incorporated in 1886 in the District of Columbia as the National Education Association, and in 1906 it was chartered by an act of Congress. The charter was officially adopted at the association’s annual meeting of 1907, with the name officially set down as the National Education Association of the United States. The original statement of purpose of the National Teachers Association remains unchanged in the present NEA charter.

In 1917 the association moved to Washington, D.C., where it acquired a permanent headquarters in 1920. In the same year the association, grown too large for the efficient transaction of business by the total membership, reorganized on a representative basis, with delegates drawn from NEA-affiliated state and local education associations. With this new arrangement the NEA increased efforts to organize professional associations of teachers at the state and local school district level. The emerging goal for the association became a united teaching profession with every teacher participating at three levels of association work—local, state, and national. Throughout the 1920s and 1930s, the association also

expanded through the development or addition of departments devoted to subject matter and positional specialties.

The 1960s saw the merger of separate associations of white and African-American educators, a situation that had arisen as a result of dual school systems in the South. Although NEA membership had always been open to all qualified educators regardless of race, an independent national organization of African-American educators, the American Teachers Association, was in existence until 1966, when its 32,000 members merged with the NEA. Merger of state associations followed, and by 1969 had been completed in almost all states.

In the late 1990s the NEA was talking merger again. At that time, the NEA was close to merging with another sister union, the American Federation of Teachers (AFT), which is affiliated with the AFL-CIO labor union. In 1998, the Representative Assembly voted down a proposal to unite the two organizations. However, a partnership agreement was approved at the 2001 Representative Assembly. The partnership agreement allows the two organizations to work together and prevents the two unions from “raiding” each other’s members.

DENISE CARDINAL

## NATIONAL ENDOWMENT FOR THE ARTS

---

The National Endowment for the Arts (NEA) is an independent federal agency that supports and funds the arts in the United States. The endowment was established by the Arts and Humanities Act of 1965, which defines the arts to include music, dance, drama, folk art, graphic art, creative writing, architecture, painting, sculpture, photography, crafts, in-

dustrial design, costume and fashion design, motion pictures, television, radio, and sound recordings. The NEA is the country's largest single source of funding for nonprofit arts.

The endowment was established on the principle that the arts are as vital to the spirit, stability, and success of a democratic country as science and technology. Accordingly, the government and citizens of the United States must preserve the country's artistic heritage and cultivate new artistic expression. Through the NEA, the federal government fosters the preservation and development of the arts by financing new and classic artistic works and their presentation, making the arts accessible to people in all parts of the country, promoting art education at all levels, preserving the country's artistic heritage, and recognizing and honoring the country's national leaders in the arts.

### **Program**

The NEA supports the arts through leadership initiatives; through partnerships with other federal agencies and with local, state, and regional arts organizations; and, primarily, through the making of grants to nonprofit arts organizations and, in some cases, to individual artists. It is not the intention of the federal government to fully subsidize the arts in the United States; rather the NEA aims at alleviating the financial stress prevalent in the arts by providing "seed" money to stimulate the private sector to provide support for the cultural growth of the country.

The NEA funds the work of individual artists through Literature Fellowships, American Jazz Masters Fellowships, and National Heritage Fellowships. Literature Fellowships of \$20,000 are awarded to writers of poetry, fiction, and drama; fellowships of \$10,000 to \$20,000 are awarded for translation projects. Since the establishment of the Literature Fellowship in 1967, many National Book Awards, National Book Critics Circle Awards, and Pulitzer Prizes in poetry and fiction have been awarded for works funded in part by the NEA. American Jazz Masters Fellowships of \$20,000 are awarded to distinguished jazz musicians. National Heritage Fellowships of \$10,000 are annually awarded to up to thirteen master folk and traditional artists who hope to teach their skills and techniques to another generation of artists. All recipients of NEA fellowships must be citizens or permanent residents of the United States.

Grants that are awarded to nonprofit organizations support a variety of projects, such as developing new works, bringing the arts to new audiences, developing new and stronger arts organizations, and preserving America's cultural heritage. The NEA's heritage and preservation grants support such projects as the restoration of historic buildings and artworks, the preservation of historic sound recordings, the documentation of dance projects, and the publication of anthologies of American literature. In 2000 the NEA formed a partnership with Heritage Preservation to sponsor Save Outdoor Sculpture!, a program to repair and maintain damaged outdoor sculptures in the United States. Another NEA program, Save America's Treasures, offers grants in cooperation with the Department of the Interior and the National Park Service for the preservation and conservation of historically or culturally significant buildings, sites, artifacts, collections, and monuments.

The NEA's grants for arts education aim to strengthen the role of the arts in America's public educational system and encourage lifelong learning in the arts. The NEA recognizes that stimulation of young audiences is essential to its goal of developing a broad base of public appreciation and support for the arts. In partnership with state arts agencies and regional arts organizations, the NEA has provided millions of dollars to support K–12 arts education projects in communities across the country. In a program conducted in cooperation with local school boards and the U.S. Department of Education, professional theater companies have received financial assistance to give free performances for student audiences. Similarly, the endowment provided support for a program aimed at sending poets into secondary schools to read and discuss their works. Other grants in support of art education have funded master classes, artist-in-residence programs, and training for elementary and high school art teachers.

To further achieve the expansion of audiences the NEA has initiated programs that bring the performing and visual arts to small towns, rural areas, and other regions of the United States where the arts would otherwise be unavailable. In 1996 the NEA helped finance the New England Foundation for the Arts, which sends contemporary dance companies on tours that include cities where few dance companies reside. The endowment has also provided funds for an experimental rural arts program to explore methods of increasing public receptivity to cultural

programs. In many states, grants have been made to develop new audiences for opera by providing funds for additional performances for neighborhood and community organizations, labor groups, and students.

The endowment has provided new opportunities for arts programming on television through grants to public television stations for the production of arts programs and their free distribution to other public television stations throughout the country. The NEA helped fund the popular series *Live from Lincoln Center*, *American Masters*, and *Great Performances*, which are broadcast around the country and seen by millions of people each year. These grants have served as an incentive to the further development of educational programming on the arts and have helped many smaller stations get access to local cultural resources.

The American Film Institute was established with funding from the NEA in order to focus national attention on motion pictures as a contemporary art. One of the institute's central responsibilities is that of promoting and guiding the burgeoning interest in this art in secondary schools and higher education. The institute is providing assistance to the entire academic community.

### Organizational Structure

The endowment's advisory body is the National Council on the Arts, which includes fourteen private citizens appointed by the president of the United States for six-year terms and six members of Congress who are appointed by congressional leaders and serve in a nonvoting capacity for two-year terms. The private members of the council are persons who have distinguished themselves through their training, experience, and interest in the arts. Past council members have included singer Marian Anderson, composer Leonard Bernstein, dancer and choreographer Agnes de Mille, artist Richard Diebenkorn, composer Duke Ellington, author Harper Lee, actor Gregory Peck, actor Sidney Poitier, author John Steinbeck, and violinist Isaac Stern. The council, which meets three times each year, advises the chairman on NEA policies, programs, and procedures and makes recommendations on applications for financial assistance.

### History and Development

The National Council on the Arts was created by the National Arts and Cultural Development Act of

1964 (Pub. L. 88-579). The National Endowment for the Arts began its work in 1965, when President Lyndon B. Johnson signed legislation (Pub. L. 89-209) creating the National Foundation on the Arts and the Humanities, consisting of both the NEA and its sister agency the National Endowment for the Humanities. The 1965 act transferred the functions of the council from the executive office of the president of the United States to the NEA.

The NEA came under attack during the 1980s and 1990s as some citizens and public officials questioned the value, quality, and appropriateness of certain NEA-supported projects. President Ronald Reagan established a Presidential Task Force on the Arts and Humanities in 1981 to develop "ideas to stimulate increased private giving for cultural activities." The task force, however, recommended that the NEA continue public funding of humanities and art projects. Between 1965 and 2000 the NEA awarded more than 115,000 grants to artists and art organizations in all fifty states, Puerto Rico, and Guam. In the 2001 fiscal year the endowment's budget was approximately \$105 million.

## NATIONAL ENDOWMENT FOR THE HUMANITIES

---

On September 29, 1965 U.S. President Lyndon B. Johnson signed legislation enacted by the eighty-ninth Congress creating the National Foundation on the Arts and the Humanities, an independent federal agency consisting of two separate but cooperating organizations, the National Endowment for the Arts (NEA) and the National Endowment for the Humanities (NEH). Through this legislation tangible expression was given to the concept that support of the arts and the humanities is in the national interest. The formation of the NEH lent credence to the belief that the humanities stimulate reflection on the values that Americans hold as a nation and as individuals, and that they offer, through their common historical orientation, interpretations of the process by which cultures and societies have reached their present complex form.

The National Endowment for the Humanities is a public body whose purpose is to bring the substance of the humanities to bear on the mainstream of American thinking and life. It attempts to do so by increasing knowledge, improving the competence of scholars and teachers, and improving public understanding of the humanities through education. The humanities include a broad list of fields, including literature, history, languages and linguistics, archaeology, comparative religion, philosophy, jurisprudence, journalism, and art history and criticism.

### Program

The NEH accomplishes its mission primarily by making grants and fellowships dedicated to supporting research, education, preservation, and public programs in the humanities. Most NEH grants are awarded to cultural institutions such as museums, historical societies, libraries, universities, and public television and radio stations. Many grants and fellowships are also made to individuals to support such activities as the writing of a book or the production of a film. The NEH does not fund creative or performing arts; the National Endowment for the Arts supports these activities.

Any citizen of the United States or a permanent resident who has lived in the United States for more than three years can apply for an NEH grant, although most grants are given to institutions. NEH grants are awarded on a competitive basis. Each ap-

plication is assessed by panels of experts outside the endowment. The National Council on the Humanities meets three times a year to review the applications and outside assessments. The council makes recommendations to the NEH chairperson, who makes the final decisions.

The NEH runs numerous grant programs. Some grants are awarded annually or on a running basis, some are awarded only once. Some grants are only available to institutions; others only to individuals. Representative NEH grant programs include the Preservation Assistance Grant of up to \$5,000 to help libraries, museums, and historical societies increase their capacity to preserve their humanities collections; Schools for a New Millennium grants of up to \$100,000 for educational institutions wishing to improve elementary, middle, and high school teaching of humanities; Institutional Grants of up to \$25,000 for historically black, Hispanic-serving, and tribal colleges and universities that wish to improve the teaching of humanities; and the Lewis and Clark Bicentennial Initiative Grant for a project relating to the history and accomplishments of this expedition.

The NEH has funded hundreds of important educational and preservation projects, as well as books, films, and exhibitions since its founding. In 1969 an NEH grant to the University of Virginia supported a project to produce the first comprehensive edition of *The Papers of George Washington*. In 1971 the NEH began funding the compilation of the groundbreaking *Dictionary of American Regional English*. In 1976 the NEH funded the preparation and publication of *The States and the Nation*, a multivolume series of state histories published in honor of the American bicentennial. In 1980 the NEH awarded a grant to the Ancient Biblical Manuscript Center in Claremont, California, to make archival photographs of the Dead Sea scrolls. In 1988 *Voices and Visions*, a thirteen-part television series on American poetry, aired on public television stations with NEH support.

Throughout its history the NEH has helped historians, literary critics, and other scholars research, write, and publish books. Many NEH supported books have gone on to win Pulitzer Prizes and other major awards. The NEH helped fund the Pulitzer Prize-winning *Gotham: A History of New York City to 1898* (1998) by Edwin G. Burrows and Mike Wallace. The NEH also helped fund David M. Kennedy's Pulitzer Prize-winning *Freedom from Fear: The American People in Depression and War, 1929–45*

(1999). In addition, the NEH funds the production, distribution, and broadcast of numerous documentary films. Filmmaker Ken Burns's documentaries *The Brooklyn Bridge* (1982), *The Life and Times of Huey Long* (1986), *The Civil War* (1990), and *Baseball* (1994) were all made and broadcast with NEH support. The NEH also supported the Academy Award nominated *Scottsboro: An American Tragedy* (2001), a documentary film written and directed by Barak Goodman.

NEH-funded projects that were underway in the early 2000s included the United States Newspaper Program, a major effort to locate, catalog, and preserve newspapers published in the United States since the eighteenth century; and the Papers Projects, which funded a number of projects to collect and publish the papers of American presidents and other historical and literary figures. The NEH was also actively funding numerous online humanities projects, including the Mystic Seaport's *Exploring Amistad* website; the Academy of American Poets' *Online Poetry Classroom*, and Indiana University's *Prehistoric Puzzles* website. Descriptions of NEH-funded projects, and other NEH news and information, are published in the bimonthly magazine *Humanities*.

Since 1997, the NEH has presented annual National Humanities Medals to individuals or groups who have helped deepen people's understanding of the humanities. Notable past winners of the National Humanities Medal have included Quincy Jones, Garrison Keillor, Jim Lehrer, August Wilson, Henry Louis Gates Jr., Garry Wills, Maxine Hong Kingston, and Doris Kearns Goodwin. Since 1972 the NEH has also selected an outstanding individual to give the prestigious Jefferson Lecture in the Humanities, delivered every spring in Washington, D.C. The Jefferson Lecture, which includes a \$10,000 honorarium, is awarded to an important American scholar who has demonstrated the ability to communicate about the humanities in a accessible and appealing way. Notable Jefferson lecturers have included poet Robert Penn Warren (1974), novelist Saul Bellow (1977), novelist Toni Morrison (1996), and playwright Arthur Miller (2001).

### Organizational Structure

The NEH is composed of four divisions and three offices. Divisions include the Preservation and Access Division, the Public Programs Division, the Research Division, and the Education Division. Offices

include the Challenge Grants Office, the Office of Federal-State Partnership, and the Enterprise Office. The Office of Federal-State Partnership links NEH with fifty-six regional humanities councils located across the United States and in Puerto Rico, American Samoa, Guam, the U.S. Virgin Islands, and the Northern Mariana Islands. Each regional council funds humanities programs in its area. The responsibility of the Enterprise Office is to raise funds for Endowment projects and initiatives, to forge relationships with other federal and state agencies and with private organizations, and to implement special programs.

The NEH is directed by a chairperson who is appointed by the president of the United States for a four-year term. The chairperson is advised by the National Council on the Humanities, a group of twenty-six private citizens who are appointed by the president and approved by the United States Senate. The NEH chairperson and council coordinate and advise the endowments for the arts and the humanities.

### Financial Support

In order to utilize as much private money as possible in its activities, the endowment is authorized by Congress to receive gifts from private sources for unrestricted purposes. These funds are then matched equally with funds conditionally appropriated by Congress for this purpose. This provision was amended in 1968 to also permit the matching of restricted gifts for purposes recommended by the council and approved by the chairperson.

### History and Development

Before the creation of the National Foundation on the Arts and the Humanities, the effort to secure federal support for the arts had gone on for about a century, and minor support for the arts did exist in many departments of the government. The most conspicuous success prior to 1965 was the establishment in 1964 of an arts council—without funds. In contrast, government support for the sciences grew rapidly after World War II, first through research support, particularly from the military, and then through the establishment and funding of the National Science Foundation. The results created an imbalance in the universities and colleges—despite the evident benefits for education in general. Federal funds were relatively abundant for the sciences, but they were entirely lacking for the humanities and the

arts. In an attempt to rectify this situation, several members of Congress introduced legislation calling for increased support of the humanities, but none was successful.

In 1963 the American Council of Learned Societies, the Council of Graduate Schools in the United States, and the United Chapters of Phi Beta Kappa Society sponsored the Commission on the Humanities to study the needs of the humanities. The members of this group included university professors and presidents, business and professional men, and school administrators. It accepted in principle the inseparability of the humanities and the arts, but concentrated on the humanities in their educational context. This commission's report, issued in the spring of 1964, received wide distribution and had considerable effect.

In Congress, Senator Claiborne Pell of Rhode Island and Representative Frank Thompson Jr., of New Jersey, who had led the effort to secure meaningful support for the arts, took the opportunity offered by this increased attention to the humanities and introduced new bills to include the arts and the humanities in a single organization. The joining of congressional and public support for both the humanities and the arts resulted in the passage of the bill and the establishment of the foundation.

The NEH, along with the National Endowment for the Arts, came under attack beginning in the 1980s as some citizens and public officials questioned the quality and appropriateness of projects funded by the endowments. President Ronald Reagan established a Presidential Task Force on the Arts and the Humanities in 1981 to develop "ideas to stimulate increased private giving for cultural activities." The Task Force, however, recommended that the NEH and NEA continue public funding of humanities and art projects. From 1965 through 1998 the NEH awarded more than \$3 billion in fellowships and grants.

## NATIONAL GOVERNORS ASSOCIATION

---

The National Governors Association (NGA) is powerful, bipartisan public policy and lobbying organization made up of the chief executives of America's fifty states, American Samoa, Guam, Virgin Islands, Northern Mariana Islands, and Puerto Rico. The NGA serves as the collective voice of the nation's state governments and provides a forum by which governors and their staffs can examine policy, share problems, and development solutions to issues of concern to the states. The NGA also represents state interests before the federal government, and provides advice and technical assistance to governors and their staffs.

#### Organizational Structure

The NGA is headed by a nine-member bipartisan executive committee, from which body the members annually elect a chairperson and vice chairperson from different parties. Former governors Bill Clinton, John Ashcroft, and Tommy Thompson have all served as NGA chairs. The NGA maintains three standing committees: economic development and commerce, human resources, and natural resources. In addition, the association forms task forces and special committees made up of at least two governors to address high-priority issues of immediate importance.

One of the association's principle bodies is the NGA Center for Best Practices. The center helps governors and their public policy staffs study problems and challenges facing their states and develop innovative approaches and solutions. The center examines practices in various states, then disseminates information on which states have the "best practices" in dealing with education, health care, the environment, social services, trade, workforce development, crime, and terrorism, so that other states can shape and reform their own policies using these practices as models.

## Education Initiatives

The NGA takes great interest in education policy and practice because the U.S. Constitution grants to state governments the primary responsibility for public education. Governors recognize their leadership role in education policymaking, and during the 2001–2002 session the NGA included task forces on both postsecondary and K–12 education.

The Center for Best Practices includes the Education Policy Studies Division, which is staffed by policy analysts with expertise in education. During the late twentieth and early twenty-first centuries, the Education Policy Studies Division focused its work on early childhood education, school health, extra learning opportunities for elementary and high school children, standards-based education reform and performance-based accountability, teacher quality and teacher preparation, and the use of technology in education.

In 1999 the NGA and Center for Best Practices launched an initiative in cooperation with seven states (Georgia, Illinois, Maryland, New Hampshire, Ohio, Washington, and Wisconsin) to build public and political support for improving access to affordable health care and education for infants and toddlers by offering, among other things, incentives such as tax credits and family leave. In October 2001 the center launched the Interdisciplinary Network on School-Health Partnerships, a two-year initiative involving Mississippi, Missouri, Utah, Vermont, and Wyoming. This initiative was designed to increase the role of the governors in school health issues, examine the relationship between health care and student performance, develop strategies for states that need to improve student health programs, and help states build partnerships that promote the health of school children.

During the late 1990s and early 2000s the center's policy analysts were also examining state practices to expand extra learning opportunities (ELOs) for children ages five to eighteen. ELOs include activities such as organized sports, dance, tutoring, and community service, which take place outside of the regular school day and supplement a child's classroom education.

In 2001 the NGA, in cooperation with the National Conference of State Legislatures, launched a two-year project to improve teacher preparation and ensure quality teaching at all levels of education. The *Colleges and Classrooms: State Strategies for Rede-*

*signing Teacher Preparation Policies* project involved five states: California, Georgia, Idaho, Ohio, and Vermont. The project brought together officials and legislators in these states with members of the higher education community and Center for Best Practices staff to address key issues related to teacher preparation. The goal of the project was to help states design legislation and regulations that would improve teacher preparation, leading to better teaching and learning in the state's schools.

## Meeting and Funding

The members of the NGA meet twice each year for three-day sessions. In the winter the governors meet in Washington, D.C.; the summer meeting is hosted by one of the states. The work of the NGA and the Center for Best Practices is funded by dues from individual states, federal grants and contracts, private foundation grants, and dues from Corporate Fellows who pay \$12,000 per year.

## NATIONAL HONOR SOCIETY

The National Honor Society of Secondary Schools (NHS) was established in 1921 by the National Association of Secondary School Principals (NASSP) to recognize and encourage scholastically outstanding high school students. Its founders wanted to form a society modeled after Phi Beta Kappa, the undergraduate collegiate honor society. The National Junior Honor Society of Secondary Schools (NJHS) was established in 1929 to honor younger, middle-level students for similar reasons.

The founding committee viewed education as a total experience and the new honor society as more than just an honor roll—they emphasized the promotion of scholarship, along with leadership, service, and character, in the original constitution. As stated in the 1997 revised constitution, the purposes of the National Honor Society are to create an enthusiasm for scholarship, to stimulate a desire to render service, to promote leadership, and to develop character in the students of secondary schools.

The constitution of NJHS is similar to that of the high school honor society, except for the addition of citizenship as a fifth criterion for membership.

### Formation and Growth

The National Honor Society is one of the most widely recognized cocurricular student activities in American high schools. The student activity program of the secondary school, essentially a development of the twentieth century, has been accepted as a vital and integral part of education. This status of student activities was re-emphasized by NASSP in its 1996 report, *Breaking Ranks: Changing an American Institution*: “The high school will promote cocurricular activities as integral to an education, providing opportunities for all students that support and extend academic learning. The concept of ‘extracurricular’ serves no useful purpose. . . . We propose to scrap this outmoded term and instead call these activities ‘cocurricular,’ emphasizing that they are integral to the educational program” (p. 18).

However, during the first part of the twentieth century, leading educators expressed considerable concern over the great amount of attention given to social and athletic achievements, and over the lack of emphasis placed on scholarship. In response to this concern, a number of educators organized local and regional societies to recognize academic excellence. Among the first was Phi Beta Sigma, founded in 1903 at South Side Academy in Chicago, Illinois. In 1906 the Cum Laude Society was organized at Tome School in Port Deposit, Maryland. By 1919 other honor societies had been established in New York City, Los Angeles, western Massachusetts, and Fargo, North Dakota. The organization of the National Honor Society in 1921 was a logical outgrowth of this developing interest.

Efforts to form a national organization were initiated at the 1919 annual convention of the National Association of Secondary School Principals in Chicago. The first chapter of the new society was chartered in 1921 at the Fifth Avenue High School in Pittsburgh, Pennsylvania, the school at which Edward Rynearson, considered the father and founder of NHS, was principal. The first official charter for the NJHS was awarded in 1929 to Webster Groves High School in Missouri.

Immediate acceptance led to continuous growth in the number of chapters and the size of the membership. Fourteen chapters were chartered during

1922; by 1930 there were 962 chapters of NHS and 128 chapters of NJHS. In 2001, the national office recognized 13,553 chapters of NHS and 5,316 chapters of NJHS. It is estimated that active membership in the two societies exceeds 1 million students per year. Chapters exist in all fifty states, the District of Columbia, all U.S. territories and possessions, and in American schools in more than forty foreign countries. Throughout the history of NHS and NJHS, membership has reflected a gender breakdown of two females to one male.

In 1921 an official emblem for the society was created in the form of a keystone and flaming torch. Widely recognized, the keystone bears at its base the letters C, S, L, and S, which stand for the four fundamental virtues of character, scholarship, leadership, and service. The torch symbolized the search for truth and is also the emblem of the National Junior Honor Society. The colors of NHS are blue and gold; navy blue and white are the colors for NJHS. The official flower for NHS is the yellow rose; for NJHS, the white rose.

### Chapter Formation and Membership

Any public or approved or accredited private secondary school in the United States may apply for a chapter by submitting an application and agreeing to operate under the society’s constitutional guidelines. Each chapter remains on the active list with the national office as long as it submits the annual affiliation payment. No individual fees are required of students, although local chapters can establish chapter dues, not to exceed ten dollars per member per year.

One or more faculty members (the chapter advisers) are appointed by the principal to administer each chapter. To assist in the selection, discipline, and dismissal of members, the principal also appoints a five-member faculty council. Specific guidelines are provided in the national handbook for the faculty councils to assist them in their duties. According to the society’s constitution, the principal reserves authority over all actions of the chapter.

To be eligible for active membership in a chapter, students must have a cumulative grade point average of 3.0 (on a 4.0 scale), 85, B, or a cumulative average that is an equivalent standard of excellence. Local chapters may raise this average to meet local standards of excellence as long as such standards are applied fairly and consistently. National guidelines

indicate that students may be considered as candidates in their sophomore, junior, or senior year; however, chapters are given the flexibility to limit candidacy to one or more of these years. Candidates must be enrolled at the school for a minimum of one semester, although exceptions can be made for transfer students.

Once this scholastic eligibility has been determined, candidates are then considered for membership on the basis of their leadership, service, and character. To ascertain how each candidate compares to the chapter standards in these three areas, the selection process recommended in the *National Honor Society Handbook* (1997) indicates that all candidates submit an information sheet detailing their relevant experiences. The local chapter may add additional qualifications or steps in the selection process. Once sufficient information has been gathered and reviewed, the faculty council votes on each candidate. Candidates become members at an induction ceremony. For the National Junior Honor Society, the selection process is the same, although membership is limited to second-semester sixth, seventh, eighth, and ninth grades, and includes citizenship as the fifth criterion needed for selection.

All local chapters are required to publish the local selection process, including the standards for the membership criteria, for all students, parents, and faculty. The national office provides information concerning these procedures on its website and offers the national handbooks for sale to the public.

### Chapter Activities

The most important ceremony in the life of any chapter of the National Honor Society is the induction ceremony at which new members of the chapter are publicly recognized. Traditionally this ceremony has included a candle-lighting component, during which the flame from the central candle (the lamp of knowledge) is used to light four candles, one for each of the four core values of the society.

At the induction ceremony, new members are often given symbols of their new membership that can include a membership pin, card, or certificate, and are asked to sign the official roll of members. A suggested format for this ceremony is provided to all chapters, but the national office mandates no single format or script, preferring to encourage chapters to compose a ceremony that has local meaning and significance.

For other activities, the rules and regulations of NHS permit considerable latitude for local chapter initiative. Though no schedule of meetings is mandated by the national guidelines, all chapter meetings must be open and under the direction of one or more professional staff members of the school.

All chapters are required to undertake an annual service project. With the growth of a new volunteer service ethic among students and educators in America during the 1990s, NHS and NJHS members have been leading contributors, in service hours, to the improvement of their schools and communities. According to the society's annual reports for 1999–2000, the average chapter commits more than twenty-five hours per member of service to the school and community through an average of more than four projects per year. The total of service contributions by NHS and NJHS members exceeds 500,000 hours per year. This high degree of involvement indicates that chapters are living up to the society's motto, *Noblesse Oblige*, or, loosely translated, "to whom much is given, much is expected."

Typical service projects include tutoring programs for underclassmen, reading development for elementary students, fundraising for local or national charities, blood drives, serving meals at local food banks and soup kitchens, and servicing the needs of the elderly in the community. Regardless of the nature of the activity, all service projects and other activities of the chapter, including fundraising activities, meet the following criteria: they fulfill a need within the school or community; they have the support and sanction of the administration and the faculty; they are appropriate and educationally defensible; and they are well planned, organized, and executed.

In order to undertake these responsibilities efficiently, most chapters elect officers to lead the chapter and assist the adviser during the year. An important responsibility for chapter officers is ensuring that all chapter members maintain their membership obligations and live up to the standards of the chapter by being positive role models on campus and in the community.

### National Control and Services

The board of directors of NASSP is also the governing board of the National Honor Society. General operational control is vested in the NHS/NJHS National Council, composed of ten principals and ad-

visers. The executive director of NASSP is an ex officio member of the national council, and the NASSP director of student activities serves ex officio as secretary to the council. National activities of NHS are coordinated by the national office staff, located at the headquarters of NASSP in Reston, Virginia.

In 2001, twenty-two organizations existed at the state level supporting NHS and NJHS activities. These organizations are all affiliated with the national office, but operate independently. Whereas on the national level, chapters are required to maintain an active affiliation with the national office, participation in state activities is voluntary.

### Conferences

In 1993 the first national conference of the NHS was held in the city that hosted the first chapter of NHS, Pittsburgh, Pennsylvania. The annual meeting is open to student members and advisers of NHS and NJHS, providing motivation and leadership training for students and professional development services for advisers.

In addition, in 2000, the national office expanded its regional student council leadership conferences (the National Association of Student Councils is also sponsored by NASSP) to include NHS and NJHS members and advisers. State conferences for NHS are held annually in those states maintaining a state association.

### Scholarship Programs
